GRANULAR

FIRST PROTEIN HYDROLYSATE
WITH A COMPLETE
CHEMICAL ANALYSIS OF EACH
ESSENTIAL AMINO ACID!

Once again, International Vitamin Corporation fills a long-felt requirement of the Medical Profession with a most pleasant-taiting protein hydrolysate preparation. The new "PHV Granular"—a combination of protein hydrolysates, carbohydrate and vitamins in a proper scientific balance—promises to become an essential in the treatment of exhaustion due to over-exertion, in the management of convalescence, in preparation for surgery and as a dietary supplement in cases of malnutrition and anemia (including pregnancy anemia)

60DIUM SULFACETIMIDE SOLUTION

30% is a new antibacterial solution for treat
ment and prophylaxis of all the common eye
infortions Possessing a wide range of harteriostatic
activity it inhibits numerous pathogens responsible for

ocular infections. Its efficacy on local application is attributed

to the facts that it is the only sulforumide salt that can be dissolved in concentration as high as thirty per cent at physiologic pH 74; that it penetrates deeply into order tissues that it is virtually non-irritating; and that it is not absorbed into the systemic circulation in detectable amounts.

SOULTACETIMUDE SOLUTION 30%

Treatment of eye infections. One or two drops instilled every two bours or less frequently according to the severity of the infection

Prophylaxis following foreign body injuries an Latinslan to the conjunctiva and cornes: One trop in tilled three or four times daily

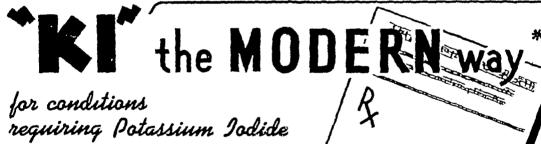

SORDIN SUFFICETIALIDE SOLUTION 30% is supplied in 15 cc. applier eye-dropper bottles.

OLD, SOLUTION FORMS of Potacaur to ide with variable dosages have proven to be largely unsatisfactory! 2 and there has been a long recognized need for a more accurate simple and convenient preparation

NEW ENKIDE (Brewer) fulfills this need—providing in a small enteric coated tablet a full gram (15.43 grains) or a half gram (7.72 grains) of Potassium Iodide easy to prescribe and easier to tolerate with minimum gastric distress Supplied 100 or 500 on prescription only—at a price acceptable to the average patient

to combat

depression associated with

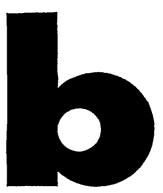

persistent pain...

Many patients suffering from persistent pain are subject to attacks of depression characterized by deep apathy and emotional exhaustion.

Thus pre-existing neurotic tendencies may be exaggerated and the pain threshold progressively lowered.

By restoring morale and optimism

Benzedrine Sulfate will often effectively combat the depression which may complicate the management of painful conditions. Needless to say Benzedrine Sulfate is not indicated in the casual case of low spirits, as distinguished from true mental depression.

benzedrine sulfate

EMPYEMA: treatment with PENICILLIN SCHENLEY

Possibles exhibits a marked adulty in marken placked offusions whicever the infection programs are possisensitive. It is most effective when placeastypes in large docate during the incipions stigue. Palloude place the observed carefully for as least live weeks after deconfluence of penicities thereby to arrive possible recurrence.

If the management of adoption, it is explicitly appropriate to apply the materia.

3 Free 3 6. JANA 125 45 (00 m mrs.

PERICILIN SCHEMEN Treatment Penrellin solution in injected dwell by high the pleural cavity after a spirately and the pleural cavity after a spirately and administration with sterile isotonic salt solution. If necessary Penicilin should not be used for irrigation. The optimum dose for each injection is 50 000 in 200 000 pmis in a volume of solution less than the amount of fluid or pur aspirated. The frequency of injections depends on the extent type and severity of the infection and the response to therapy. Treatment should be continued until after the fluid becomes sterile

Surgical intervention is necessary if fibrin masses or loculation prevent adequate aspiration or if peniciliin therapy is ineffective as indicated by persistence of positive cultures after one week

•

SYSTEMIC THERAPY Systemic use of penicillin is indicated as a supplement to intrapleural therapy particularly where there exists an underlying active pulmonary infection or a bronchopleural fistula.

doubly valuable in the treatment of overweight...

In a recent clinical study, Hawirko and Sprague* found that Dexedrine (d amphetamine) exerts two beneficial actions in the treatment of overweight

- 1 It depresses the appetite "sufficiently to enable the patient to follow the diet closely without feeling it too great a burden"
- 2. Its unique central nervous stimulant effect combats the feeling of "discouragement and irritability which usually accompanies rigid adherence to prolonged use of a low calorie diet"

EVIDENCE

of Steroid Therapy in Arthritis

Observers who have noted the use of Ertron-Steroid Complex, Whittier-in arthritic patients have been impressed with-

- 1 The increased mobility of affected joints
- 2 Reduction in swelling
- 3 The relief of pain reported by patients

Ertron is a systemically acting drug for a systemic disease. The therapeutic action of Ertron manifests clinically a fact of steroid chemistry—Ertron is unique chemically as well as therapeutically

The method of ergosterol activation employed in the preparation of Ertron produces a complex containing hitherto unrecognized factors which are members of the steroid group. The isolation and identification of these substances in pure form further establish the chemical uniqueness and steroid complex characteristics of Ertron.

Each capsule contains 5 mg of activation products (Whittier Process) having an antirachitic potency of not less than 50,000 USP Units

Physician control of the arthritic patient is essential for optimum results Ertron is available only upon the prescription of a physician

Supplied in bottles of 50, 100 and 500 capsules Also, for supplementary intra muscular injection, Ertron Parenteral in packages of six I cc ampules

THERAPY The therapeutic efficacy of histamine in rheumatoid, arthritic and neuralgic affections has been repeatedly confirmed by clinical studies Imadyl Unction 'Roche' combines the potent vasodilating effect of histamine with the dependable analgesic action of salicylates. Its application — by simple massage — stimulates sluggish local circulation, brings a pleasant sensation of warmth to the affected area, and markedly relieves pain and discomfort. This singular effectiveness of Imadyl Unction makes it a particularly valuable remedy for the relief of rheumatoid, arthritic and neuralgic aches and pains. Supplied in 1½-oz tubes and 1-lb jars.

AN OBJECTIVE IN MODERN-DAY PEDIATRIC FEEDING

Early Conditioning

TO A WIDE VARIETY OF FOODS

oped He distinguishes between sweet and sour, bitter and bland, as indicated by grimaces and refusal to take food which is bitter or sour. But individualized taste develops rapidly with growth and experience. There are far-reaching advantages in providing a widely varied diet at a very early age. The diversity will accustom the infant to a wide range of taste, he will learn to enjoy the variety of foods essential to optimal growth and development, aversion to strange foods, so often developed when first introduced at a later date, is thus largely avoided.

Libby's Baby Foods provide the variety needed for such planned feeding. They are strained AND homogenized, and so fine in texture that they flow readily through a nipple opening of ordinary size, when mixed with the milk formula. Hence, they lend themselves to feeding early in life, even as early as the fifth week—before food hostilities develop

Taste is important in conditioning the child to lasting food likes Libby's Baby Foods are palatable Taste test Libby's Spinach, for instance, and learn for yourself how good it is

anlibiolic nasal decongestant

Better cleansing in acne vulgaris was successfully attained when Acidolate—replace ment for soap—was used as the skin cleansing agent in over 400 acne vulgaris patients during a period of four years 1

Acidolate, the original and only sulfated-oil detergent with a background of extensive clinical research, offers the following advantages as a skin cleanser in acne vulgaris —

- 1 Achieves thorough and better cleansing by gentle massage instead of harsh scrubbing.
- 2 Removes excess sebum as well as other fatty materials and loosens epithelial debris
- 3 Seems to lessen formation of new comedones and facilitates removal of those that do form
- 4 The acidity of Acidolate (pH 6 25) approximates that of normal skin and does not change the protective action of sweat
- 5 Renders the skin receptive to the action of prescribed therapeutic agents.
- 6 Insures the patient's cooperation because of early favorable response to the "Acidolate Massage cleansing technique,
- 7 Contains no alkalis no irritating fatty acids of low molecular weight and no allergenic substances
- 8 Water miscible, Acidolate rinses off readily with hot or cold hard or soft water

Printed instruction sheets for use of Acidolate by some vulgaris patients available to physicians on request

Other indications When soap is contraindicated as in dermatitis venenata, eczema, seborrhen, etc. when soap is inadequate as in removing residual ointments

Supplied in 8 oz and gallon bortles

. More Rapid Nutritional Pick-Up

However, rapid return of the feeling of well-being would not so generally follow administration of Licuran B if it did not provide, in addition to the proper ratio of copper and iron, correction of the B-vitamin deficiency which so frequently complicates hypochromic anemia

The ratio of copper to Iron in Licuron B assures efficient utilization of the Iron. The incidence of gastrointestinal reactions, often seen in iron therapy, is reduced because it is possible to give less iron and still get a more rapid regeneration of hemoglabin. During administration of Licuron-B the level of general health often rises as dramatically as does the level of hemoglabin. The grateful patient is enjoying improved nutrition occasioned by the liver B-vitamins and crystalline thiamine, riboflavin and niacinamide in Licuron B

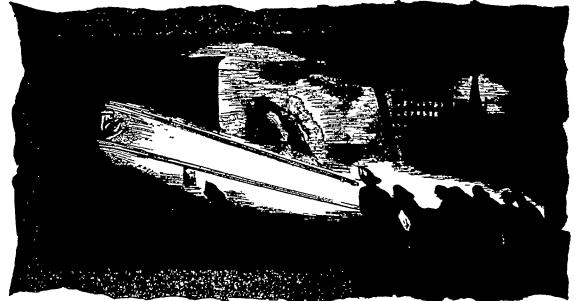

Small, easy-to-take Licuron-B tablets are supplied in bottles of 100 500 and 1000 Literature and sample on request. Wisconsk Alumni Research Foundation—U S. Pat. No. 1,877,237 LAKESIDE LABORATORIES, DNC., Milwoukee 1 Wisconsia.

concentrated power

The greater the concentration, the more effective the results

A combination of highly potent quantities of vitamins known to be essential in human nutrition, in balanced therapeutic amounts, as in THERA-VITA* capsules, supplies the concentrated power necessary for effective results in cases of hypovitaminosis

Chera-lela capsules represent a highly potent, multivitamin preparation which has been designed specifically to meet the patient's need for large doses of the vitamins either as a therapeutic measure or as a corrective supplement in detary insufficiency

Thera ila therapeutic hultivitamin capsules are easily swallowed, tasteless, and well-tolerated

Each THERA-VITA multivifamin capsule contains

12,500 U.S.P Units Vitamin A (liver oil conc.) Thiamine Hydrochloride () 10 mg Riboflavin (B2) 10 mg 100 mg Niacinamide Pyridoxine Hydrochloride (B₀) 1 mg 10 mg Calcium Pantothenate 150 mg Ascorbic Acid (Vitagin C) Vitamin D (Activated Ergosterol) 1,250 U.S.P Units. Bettles of 100's and 250

Remember, doctor, THERA VITA capsules are to be pre scribed and pot simply suggested to your patients. Help us to maintain the professional status of this product and to avoid its indiscriminate use by the laity without medical supervision

Editorial

Much Needed Information

The Council on Medical Service of the American Medical Association is to be con gratulated on the excellence of its newly issued compilation "Voluntary Health In surance vs. Compulsory Sickness Insurance" The booklet of 124 pages contains twenty four articles from various sources and an introduction by Edward J McCornick, M D, Chairman of the Council, and constitutes a landy reference work for writers, speakers, and debaters, as well as for the information of the doctors and the public in general We quote from the introduction

If the answer to whatever medical problems may exist cannot be given by the 90 per cent of physicians whose opinions are generalized in this work, there can be no logical answer We expect engineers, lawyers, ministers, and architects to guide us when national problems in their respec-We follow our tive fields confront the Nation great military and naval leaders when our country is threatened by other nations. This is as it should be. Trained men should guide us in their particular fields Who would desire to have his house built by a doctor or lawyer? Who would choose as his architect a soldier or minister? Who would feel safe in a court of law represented by a social worker, a politician, or an engineer?

The medical profession is opposed to communism socialism, collectivism, and compulsion in any field of endeavor in America and especially in the medical field. There is no selfialness in our stand. We desire better living conditions and in creased opportunity for all. We recognize the fact that medical progress must cease and that sickness and mortality will increase under any government program of compulsory health insurance. We do not desire the promised increase in medical incomes under government control.

It is the hope of the Council on Medical Service of the American Medical Association that the material herein assembled will give to those who peruso it a few of the reasons for the desire of all physicians to remain free men and free women As we have contributed during war and disaster, so we now desire to contribute in peace to the wel fare of all and to the preservation of Democracy

We hope that this booklet will be read thoroughly by doctors and the public alike. The importance of the subject is great. Sooner or later the public will have to decide which path it will travel The final decision should be based on the fullest possible information—not propaganda. Therefore, such a compilation of source material from widely scattered publications, all authoritative, and issuing from a responsible Council

of the American Medical Association is a valuable step in the right direction

Along the same lines, the Medical Society of the State of New York, through its Bureau of Public Relations, has prepared and will shortly issue a handbook in the form of questions and answers on the subject of sickness insurance, entitled "Check and Double Check," by Mr J Weston Walsh, a school teacher of Portland, Maine Mr Walsh discusses the question of voluntary health insurance vs compulsory sickness insurance, giving what he thinks are the outstanding points in the controversy, from the standpoint of a plain American citizen, just as they impressed him in the course of his own work on the handbook.

Mr Walsh was asked to do the job because this question will ultimately be decided in the forum of public opinion. He is thinking here of what would happen to him under compulsory sickness insurance. As an average citizen, he does not like it Legislators already know the doctors do not like it. Here is the evidence that the J. Weston Walshes of the country do not like it either.

It is hoped this subject will be approached

in the spirit of inquiry, which is Mr Walsh's attitude, before opinions are formed on so important a matter as how to obtain medical care Hence, the title, "Check and Double Check"

Free of large masses of statistics, and written in a colloquial style, the author's aim is simplification without distortion. This painstaking work is offered for use as a speaker's handbook. For this purpose, a ready-reference index is provided. The pamphlet is intended for editorial writers, radio commentators, ministers, teachers, lawyers, and members of Chambers of Commerce, Parent-Teachers' Associations, Women's Clubs, labor unions and Granges, as well as doctors called upon to speak on the subject

Copies of the American Medical Association's pamphlet may be had by writing to the Council on Medical Service, American Medical Association, 535 North Dearborn Street, Chicago 10, Illinois

Those desiring copies of "Check and Double Check," may obtain them by writing to the Bureau of Public Relations, Medical Society of the State of New York, 292 Madison Avenue, New York 17, New York

A New World for the Doctor

The citizen-doctor of this part of the postwar world, if he can find a place to work, obtain an automobile and the equipment he needs to furnish his office, can probably make out as well here as any citizen-doctor ever has, and far better than his colleagues in many foreign lands. At least he still has the opportunity to exercise his resourcefulness in a competitive and relatively free society. So much for his own work and opportunity in his small orbit.

As a doctor, he has increasingly available scientific information of great variety and accuracy to put to use for his patients' benefit, thanks to the research of many people in many fields. Of his medical knowledge and material he can be reasonably certain. There he is on sure ground.

As a citizen, he is, in all likelihood, befuddled by the maze of extraordinary events in which he is living, the astounding, sinuous, and expanding use of propaganda to persuade him to believe he thinks this or that, and the clever stage management which is calculated to provide an illusion of reality for many situations, acts, and attitudes of the grossest absurdity. As a citizen, he must feel that he is being given the run-around, for, on the other hand, the realities, not the stage-managed illusions, often prove to be more preposterous and grotesque than they can be made to appear by any device

Actually, the modern citizen appears to be the victim of his own "improvements" His improved communications systems, for example, have swamped him by their number and excellence, his still somewhat medieval personal biologic equipment does not necessarily qualify him even with benefit of improved education to cope understandingly with the complex and allegedly improved social, economic, and political situations of

which his improved communications make He is not on sure ground as a him aware edizen

But every doctor-citizen is also a taxpayer About this there is a profound simplicity that invites comprehension All the doctorcitizen has to do is to apply himself and his scientific information and material gainfully and he will have the wherewithal to pay his taxes both direct and indirect. A refresh ingly simple thought in a complex world Expensive simplicity

As a doctor-citizen taxpayer what sort of a postwar world may be expect in which to exercise his art of medicine in order to pay his taxes? Says the New England Journal

of Medicine 1

The postwar world, to date, has been a world of mutual distrust, jealousy, and suspicion It has been a world of unrest, of strife of disharmony, of violence, of muscle-bulging We are learning again, as we have learned before and forgotten

that alliance in a common cause does not mean even temporary friendship The emotional factor of good will is a personal, not a group, phenomenon, and rarely is the moral discipline of the individual sufficient to place good will above im mediate self interest

The Four Freedoms, around which the allied nations rallied in the dark war days, have been kicked into a cocked but by some of their adher ents and allowed to remain there by the rest

Palestine, which gave us one of our early ex amples of man's violent reactions to a policy of good will toward man still furnishes us with illustrations of violent reactions

Our domestic problems we will no doubt stag ger along with and settle in the usual bivalent democratic fashion-partly right and partly wrong So far as our foreign relations are con cerned, Brooks Atkinson, the able New York Times correspondent recently returned from Russia, has given probably the best picture of the working policy toward its neighbors of the bear that walks erect It might be phrased in the words to his skipper of the mate of the whaler Mozambique "All I wants from you is ccevility and d little of that "

The Submariner

We quote from an article entitled "The Mental Health of Submariners, with Special Reference to 71 Cases examined Psychiatrically "In attempting to explain the break downs that occurred when the submariner hit the beach, "A commonly held theory that 'lack of an escape route' in submarine service 15 rejected, it was found that in such cases breakdown is merely postponed until there is an escape route "

We agree with Surg Lt McHarg' but we think his standards are too high mariners, he concedes, do not break down on duty because they have no escape route Confronted with a situation about which there can be no possible argument they make the best of it. We are reminded of the remark of the veteran foretop man when he read Nelson's famous signal "England expects every man to do his duty" "What does the b think we are going to do?"

When he gets ashore and has an escape route, he breaks down And who is there

with a standard high enough to blame him? Confronted with a given situation there are three things that you can do with it, change it, or commit suicide submariner cannot change it, there is no sense in suicide because he is probably going to be killed anyway, so he puts up with it

Except in our more pessimistic moments. we hesitate to compare ordinary life with that of a submariner We have never lived the life of a submariner, therefore, we deem it terrifying and unlivable But is it? He lives in a fairly stable temperature If there is such a thing as an ideal communal community, his is it The life of every man on board is in the keeping of every other gets food, clothing, the roof over his head from a paternal government. In wartime he is sustained spiritually twenty-four hours a day by the consciousness that he is engaged in a holy cause—the extermination of the enemies of mankind. And he never has a nervous breakdown until he gets ashore. Why not? Because he can't afford to

"Because he can't afford to" is perhaps a rather brutal way of stating his predicament

¹ Vol. 235, No 9 Aug. 29 1946, p 310

¹ McHarg James F: Jour Ment. Sc 92: 343 (April)

If he performs his task, no matter how humble it may be, he has the supreme satisfaction of being an integral, essential part of his community. By the simple turning of a valve, he has saved the lives of the ship's company just as surely as did the captain who ordered the dive. That is the almost perfect state. With few exceptions the reason anyone has a nervous breakdown is because he is thinking of himself first and his duty second.

When he gets ashore and feels the solid earth under his feet, what confronts him? A wife who may have been unfaithful? Probably not, because she had no misgivings Yes, we know that submarines about him sometimes touch at foreign bases, but we are painting in broad simple strokes Another mouth to feed? Very likely A housing shortage? Certainly Higher prices? Yes A country and production paralyzed by selfish minorities and unprotected by a government shamelessly political The very world menaced by the atomic bomb—the invention of man himself Is it any wonder that a submariner promptly has a nervous breakdown? He can afford to The essential tensions of his existence are relaxed the leisure, for the first time in weeks, or months, to think about how he feels common with the great majority of human beings—the fools—he expects to feel well Why should he? Issuing naked from his cellular existence, confronted by some of the

conditions we have mentioned, he doesn't feel at all well. The conditions are not of his making and he has no control over them And, presently, he falls panting and exhausted upon the warm bosom of the Veterans Administration

How would it be if all of us pretended we were submariners? Thousands of men have elected to be mariners because they liked the life. Conrad and McFee, for example, elected to live in a microcosm because they felt they had a chance, not necessarily of dominating it, but of living in it—happily

We do not pretend to be an authority on psychiatry, but the Church has had a good deal of experience with it. As the Prayer Book says in "My duty toward my Neighbor," "and to learn and labor truly to earn mine own living, and to do my duty in that state of life unto which it has pleased God to call me"

Dear, dear, what have we stumbled on? Life in a submarine means making the best of it from day to day. Why don't we all try it? The submariner doesn't break down because he has no escape until he steps ashore. Well, we all of us have just as much of an escape as he has—death. His term of duty may be shorter and his chances of death greater. But the civilian risks death every time he crosses the street. Suppose we think over the comparison. And delay just another day before resorting to our particular, individual escape mechanism.

Current Editorial Comment

Resignation of Dr Rogers.—Dr Edward S Rogers has resigned as Assistant Commissioner of Health, as noted in our Medical News column His departure is acknowledged with many regrets by those who have been associated with him in developing the close relationships between the State Department and certain activities in the State Society

The Public and Penicilin Opportunely, we think, the Council of Pharmacy and Chemistry of the American Medical Association makes available to physicians

1 J.A M.A 131 1423 (Aug 24) 1948

facts about the use of penicillin and invites inquiries about other drugs and therapeutic agents. The Council takes note of the fact that unwarranted fears have been created in the minds of the public "concerning the value of penicillin and other new remedies," by some recent articles in "periodicals of wide circulation," which articles, unfortunately, the Journal of the American Medical Association says, are factually incorrect Doubts and fears in the minds of patients concerning the therapy which they receive may prevent "the fullest realization of benefits from treatment"

This, in our view, is a very restrained statement. It does not take into account the

further distortions, misinterpretations, amplifications of possibly originally slight misstatements of fact which occur by word of mouth and are passed on for distribution and additional amplification Often the original source is forgotten or mushaid, or wrongly remembered, or is of no apparent consequence to the loudspeakers of the human communications system which is concerned principally with volume of word traffic and the devil take the hindermost even if informed as to the facts, can never hope to cope with this verbal traffic problem, but that certainly is no excuse for not doing what they can, when they have the opportunity to get in a word edgewise, and the Council by briefing the doctors performs a most hudable service. Of the periodicals the Council save

Physicians should be in a position to give their patients the facts concerning penicillin and to allay any doubts or fears created by these publications. Briefly, the facts concerning the latest developments in penicillin therapy are as follows.

1 Commercial penicillin has consisted of varying mixtures of one or more of the five known fractions F, G, Y, K and dihydro F

2 Penicillin K is apparently rapidly destroyed or eliminated in the body, and therapeutic levels are not achieved or maintained in the body fluids following ordinary doses

3 Commercial penicillin now available is predominantly penicillin G, which is known to be effective although some of the penicillin produced for a few months in 1945 may have had relatively less G and more K than previous or subsequent batches

4 As far as facts are available, penicillus F and X are as active clinically as penicillus G Further research will be necessary to define

their usefulness with preciseness

5 Since precise methods are not available for the routine determination of the quantities of each fraction in each batch of penicillin the National Research Council has recommended increased desage of penicillin as a safety precaution, particularly in the treatment of syphilis, in which the end result of therapy cannot be evaluated for a long time

6 Although bacteria have been made restant to penicillin in the test tube, development of clinical reastance has not become a problem. Such an eventuality may be provented, in part, by giving adequate and not

minimum doses of penicilin

7 All penicillin and penicillin pharmaceu ticals currently on the market have been ex ammed and cortified as to safety and efficacy by the United States Food and Drug Administration

8 It is possible that natural or synthetic variations of the penicilin molecule will result in the development of a clinically better penicillin. None better than penicillin G is now available.

While it is realised that the rapid develop ments now being made in therapeutics make it increasingly difficult for busy physicians to read and evaluate the many scientific articles appearing in hundreds of periodicals, the physician can keep himself informed of the more important developments through a study of the Reports of the Council on Plan macy and Chemistry Furthermore Council office and its personnel are always ready to answer inquiries and furnish information on drugs and therapeutic agents cians, by using this service, can allay the fears of their patients who have come to doubt the efficacy of penicillin even when properly used

Seems as Though Doctors, and others, are frequently chided for using long words

in their speaking and writing

Latest blood to our knowledge in the war against long words has been drawn by Dr Hugh R. Walpole¹ who contends that Basic English can convoy most thoughts worth conveying Says the Chronicle

Prolegomenously, it may appear vespertilional to asseverate that reduction of the verbal arms mentarium would occasion no diminution in communicability but Dr Walpole's antisesquipedaliansim is based upon authoritative ratiocina tion

The teleology of ideational communication shows a quinque millennial blastogenesis and proliferation toward the sesquipedalian from the almost ectogenetic phase of hieroglyphical literation and primitive syllabification to our own period of dollachonomenclatural tautology

We approach the point of nonassimilability and the danger of evolving an intellectual extrateritoriality from which the majority would be relegated to sterile antidisestablishmentarianism

The Chronicle is of the opinion that the good doctor has "got something there"

The editors of this Journal, after careful consideration of Dr Walpole's contention and of the Chronicle's observation, are inclined to agree We are reminded that there is no zeal comparable to that of a reformed sinner The short, Anglo Saxon word for us in future, brothers!

^{1 &}quot;Antisequipedalianism"-Ban Francisco Chroniele.

In Memoriam

Dr Kirby Dwight, for a long time an active participant in the affairs of the Medical Society of the State of New York, an officer and a wise counselor, died on December 3, 1946, after several months of invalidism, at the age of saxty-six.

Dr Dwight was born in Fairfield, lowa, in 1870 He was graduated from Princeton in the class of 1901 and from the College of Physicians and Surgeons of Columbia University in 1905. After interning at Roosevelt Hospital and the Sloane Maternity, he practiced in New York City, became Associate Surgeon at Roosevelt, and later Director of Surgery at I incoln Hospital, where he also served as Vice-President of the Board. He was a Diplomate of the American Board of Surgery, a Fellow of the American College of Surgeons, and a member of the New York Surgical Society. A Fellow of the New York Academy of Medicine for many years, a Trustoe, a member of its important Committee on Public Health Relations, he participated actively in this work as well as in that of the County Society, of which he was successively Treasurer and President. His club was the University

An outstanding and lovable personality has been taken from our ranks. After a service of five years as Treasurer, Dr. Dwight was elected a Trustee last year and was a member of the Society's Publication Committee. He served most faithfully in these various capacities and endeared himself to his friends and colleagues by his quiet and gracious manner, by his kindliness, by his keen sense of humor, and by his readiness to be helpful whenever called upon. The memory of his presence will remain as a very fond one among his associates, who will ever mourn his untimely death.

LOCAL ANESTHESIA FOR CESAREAN SECTION

FRANK P LIGHT, M D, Brooklyn, New York

(From the Long Island College Hospital)

POR many years local anesthesia has been used for cesarean sections at the Long Island College Hospital We admit that it was far from satisfactory until the technic now in use was adopted late in 1941 This technic was described in detail by Beck in 1942. For his preliminary work, the reasons for the selection of the various solutions and the dangers of local anesthesia the reader is referred to that article

This presentation will be limited to a brief description of the technic and our results with it

Technic

Three different solutions are used

Solution 1 consists of 50 cc of 1/2 per cent procame without adrenalm. It is employed for the intradermal and subcutaneous infiltrations which anesthetize the site of the incision. Adrenalm is omitted from this solution to avoid skin sloughing which occasionally follows its use

Solution 2 is prepared by adding 1 cc of 1 to 1,000 adrenalin to 200 cc of 1 per cent procaine. This 1 per cent procaine and 1 to 200,000 adrenalin solution is used only for the deep nerve-blocking injections which are made in the vicinity of the semilunar lines at the outer borders of the recti muscles.

Solution 3 is made up of 50 cc of 1/2 per cent processe to which 1/4 cc of 1 to 1,000 adrenalin is added. It is used to infiltrate the peritoneum ver the lower part of the uterus. This solution is used later if it is felt that more injections are needed to complete the anesthesia.

A 10 cc syringe equipped with lateral and plunger rings is used for all injections

The point of a 1½ inch 25-gage needle, bevel down, is introduced into the skin, slightly to the left of the midline, at the upper end of the proposed incision, and enough of solution 1 is injected intradermally to raise a wheal about 1 cm in diameter. The needle is then carried toward the symphysis, directly under the skin, injecting solution constantly throughout the length of the needle. The point of the needle is then elevated and another intradermal wheal is raised, from below. As the needle is withdrawn, repeated small injections are made into the deeper subcutaneous tissue. This has been accomplished with one needle puncture of the skin in raising the original wheal. The needle is then

introduced into the second wheal and the process is repeated. Usually three or four such punctures will completely anesthetize the entire length of the proposed incision, using a total of about 25 cc of solution 1 (Fig. 1)

The skin and subcutaneous tissues are anesthetized almost immediately and may be incised down to the fascia over the rectus muscle inch 22-gage needle is then introduced just above the fascia and passed outward to the outer border of the right rectus muscle The plunger is pulled back to make certain that the needle is not in a vein and 2 cc of solution 2 are forced into the region adjacent to the linea semilunaris Similar injections are made at intervals of 1 cm on each side of the wound as shown in Fig 2 At the upper and lower angles, the needle is passed obliquely so that the injections may extend beyond the limits of the incision It is essential that an attendant keep a record of the amount of solution used, since it has been found that at least 90 cc of solution 2, but rarely more than 110 cc, are needed to give complete anesthesia in this area. If the injections are made correctly, a continuous mass of 1 per cent procame is placed along this area on each side of the incision in order that it may infiltrate through the fascia and block the nerves before they give off the terminal branches which supply the abdommal wall from the peritoneum to the skin

At this point the time is noted by an attendant and ten minutes are allowed to clapse before proceeding with the operation. This interval is necessary for the blocking of the nerves. The waiting period is the most difficult part of the procedure, as only a portion of the time is needed to ligate the superficial vessels. However, the success of the local anesthesia depends upon its strict observance.

After the required time has elapsed a small incision is made in the fascia with a knife and this is enlarged with scissors. Scissors are used because with imperfect anesthesia their use will be felt even though a knife incision might not, since pain sense disappears before tactile sense. Thus the operator is warned that a somewhat longer interval of waiting is indicated or that more of the anesthetic agent should be used. Rarely is it necessary to use more procaine. When the scissors are not felt, the operator may proceed with the assurance that the anesthesia is perfect and that even the peritoneum may be incised without pain.

Presented at the 140th Annual Meeting of the Medical Society of the State of New York, Section on Obstetrics and Gynecology, May 1, 1946

Fir 1 The mession will be made through the line anothetized by the intradermal and subcutaneous injections

The peritoneum is then exposed by separating the inner margin of the rectus muscle from its sheath Slight traction on the fascia with clamps facilitates the dissection and will not cause pain if the anesthesia is adequate. The peritoneum is then grasped with claimps and incised usually causes no pain unless too much tension is exerted by the clamps. If it causes discomfort the pentoneum should be injected with solution 3 before it is incised Rarely has this been found pecessari

At this point, 5 ec of solution 3 are injected Into the subpersioneal tissue at each side of the bladdor

Next the pentoneum on the anterior surface of the uterus about 1 inch above the bladder is picked up with smooth pointed forceps and 10 ee of solution 3 are injected beneath the bladder reflection With gentle circular pressure this fluid is massaged toward the sides and under the bladder (Tig 3)

A transverse incision is made in the bladder reflection and seissors are passed beneath on one side opened, and withdrawn Using the finger in a side to side motion, the peritoneum and bladder are then freed from the lower uterine This step is repeated on regment and cervix the opposite side and the adhesion in the mid line is cut. The bladder is then entirely freed If it seems necessary, an upper from the uterus flap 18 separated in a similar manner

At this point, 1/1 grain of pantapon and 1/100 grain of scopolamine are given and nitrous oxide inhalation is started. The uterus is incised with a knife until the membranes are encountered and the incision is then enlarged with bandage scis-The child's head is delivered manually and with pressure on the fundus, the rest of the body follows easily Immediately after the delivery of the child, the nitrous oxide is discon tinued The gas should be given for only one minute to produce analgesia rather than anesthesia. If given for any longer period it may give rise to an excitement stage with vomiting and cause the patient to force the intestines into the operative field Immediately after delivery of the child 1 cc of ergotrate is given

Deep injections to block the nerves The needle is introduced at the junction of the fascia and subcutaneous tissues and the injections are made at 1 cm intervals in the region of the semilunar line

The uterms wound is now closed with fater rupted sutures placed 11/2 em apart ubiele ass tauth held, but not fled. The wound is the spread apart so that a hand may be introfered for separation and removal of the placents To the separation and removal of the players and trons oxido is again administered for our to The previously introduced sutmes me plant and additional ones are placed wherever The uterme inclsion is then es tion, pletely by auturing the flap to the

To determine the efficacy of this local technic, the patients are divided into four groups

I Those in whom the anesthesia was completely satisfactory

2 Those in whom the anesthesia was fair. In this group are the patients who complained to some extent through part of the operation. Later questioning revealed that these patients had felt little or no pain, but were either frightened or had complained of the uncomfortable position on the operating table.

3 Those in whom the anesthesia was poor These patients complained throughout the procedure and apparently experienced real pain or were of such an excitable nature that they should have been recognized as poor candidates for local anesthesia

4 Those who might be regarded as complete failures In this group it was necessary to supplement the local with general anesthesia

The number in each of these groups is shown in Table 3

TABLE 3 -- RESULTS

_	1,1252 0	14200010	
1234	Completely satisfactory Fair Poor Failures	216 15 6 18	84 7 per cent 5 9 per cent 2 4 per cent 7 0 per cent
	Total	255	

Two cases of placenta previa were eliminated from the tabulation because fresh vaginal hemorrhage occurred after the operation had been started and was proceeding satisfactorily. This required the rapid delivery of the child. Hence inhalation anesthesia was used

If the first two groups are combined, it may be concluded that the anesthesia in 90 6 per cent of the cases was satisfactory. By combining the last two groups, it may also be concluded that 9 4 per cent were failures

The entire series of cesarean sections was the work of 21 different surgeons 16 staff men, and 5 residents As might be expected, many of the

failures occurred early in the experience of a new resident, before he had developed any great degree of surgical skill or had not yet learned the importance of nor acquired the ability to handle the tissues gently. Some of the staff men used the technic on only one or two occasions and it could hardly be expected that their results would be good. Some of the other men do not have the temperament or the patience, nor are they willing to take the time to develop a satisfactory local technic. In the hands of those operators who have been willing to take the time and have had the patience to completely master the technic, the results have been almost uniformly excellent

As was stated by Dr Beck in his original description of this technic, the procedure is time consuming. This disadvantage is felt to be more than compensated for by the advantages of the technic. The average time necessary to complete the operation was slightly less than eighty minutes. (Shortest, thirty minutes, longest, one hundred and fifty-five minutes, average, 79 5 minutes.) It should be obvious that no-body could follow the detailed steps of the technic, handle the tissues with proper respect, and hope for a satisfactory outcome if he completed the operation in thirty minutes.

Recently, 100 mg of Demerol and ½00 grain of scopolamine have been administered to 67 of the patients one hour before operation. The operators who used this preoperative medication found it to be very satisfactory and without harm. All of the infants breathed immediately after delivery.

In 45 instances, operations other than the cesarean section were done (Table 4) For these additional procedures, the local anesthesia usually was supplemented with nitrous oxide analgesia. In those cases subjected to hysterectomy, the local technic was followed until the child was delivered and the rest of the procedure was completed with inhalation anesthesia. This naturally was done in the interest of the child

TABLE 4-Additional Operations

Tubal ligation for sterilization Hysterectomy Tubal ligation and hermorrhaphy Myomectomy	30 12 1 2

There were only two cases in which any complication occurred during administration of the local anesthesia. In one, the blood pressure rose during the injection of solution 2 above the fascia. However, by the time the ten minutes had elapsed, the pressure returned to normal and the operation continued uneventfully. In the other case, the blood pressure was noted to be falling before the first injection. As the skin was infiltrated with solution 1, the pressure continued

to fall. This patient was returned to her room and twenty four hours later the cesarean section was done under inhalation anesthesis.

Postoperative complications were infrequent Superficial infection of the wound occurred once with unoventful recovery Separation of the wound took place in two instances. One was resutured on the fourth day and a satisfactory recovery was made. The other was resutured on the fifth day and the patient died. The details of this case are presented below.

Three patients had postoperative homorrhage. Two of them died — These will be described later. The other patient was subjected to hysterectomy four and a half hours after the initial procedure and a piece of placenta was found in the utorus. The patient recovered — This should emphasize the importance of carefully examining the placenta at cesarean section— It is understood that the obstetrician at this point is preoccupied with his utorine closure—but there should be someone in the operating room, competent to inspect the placenta—to whom this responsibility may be delegated.

Pulmonary embolism followed the cesarean section in one case and resulted in death of the patient. This case is reported later

Four mothers died a mortality rate of 1.5 per cent. The details of the four deaths follow

Case Reports

Care 1-S B 20 years old was in her second pregnancy Her first pregnancy had been terms nated by cesarean section because of an asymmetrical pulvis. Under local anesthesia, a low single flap cesarean section with transverse incision of the nterus was performed electively Some bleeding was noted under the flap but since no bleeding point could be found the closure was completed About one hour after return to bed evidence of shock appeared. Soon vaginal bleeding began. In spite of large amounts of glucose plasmu and whole blood there was no improvement. Four and onehalf hours after operation the patient was again taken to the operating room and the abdomen reopened Four to five hundred ec. of blood were found free in the peritoneal cavity The blood had extravasated under the entire bladder flap the lower parietal peritoneum, and into the broad liga ment. Rapid hysterectomy was performed. Bleed ing continued from under the bladder until several bleeding points low down were ligated The patient was returned to bed in serious condition and died six hours later Inspection of the removed uterus showed no lateral extension of the transverse incirion.

Case 2 —Because of a previous cesarean section, an elective Krönig operation was done under local anesthesia on the patient, M S Two hours after operation the patient went into shock. Fifteen minutes later there was a guest of blood from beneath the abdomined dressing. A transfusion was given

and the patient was returned to the operating room. When the wound was reopened, diffuse venous bleeding from the rectus muscle was found. There was no free blood in the peritoneal cavity. Several small bleeding points found under the bladder flap were ligated. The abdominal wall was again closed apparently with all bleeding controlled. Another transfusion was given. The patients condition appeared satisfactory and remained so for a number of hours. Later, she again went into shock and in spite of transfusion died ten hours after the second operation.

It is possible that had these patients been under general anesthesia a more careful and thorough inspection night have been made revealing the bleeding points before the initial closure. Thus it is felt that local anosthesia may have played a part in both of these deaths.

Case 3 -The patient, B C was an elderly primi para with a breech presentation and failure of en gagement after a short trial of labor A Krönig cosarean section was done under local anesthesia On the fourth postoperative day signs of intestinal obstruction appeared. A Miller Abbott tube was inserted with no change. The next day the wound was inspected and a loop of gut was found just be-The wound was resutured. There noath the akin was evidence of an overwhelming infection and in spite of all therapy her condition became worse On the seventh day anuris developed followed by come and death on the eighth day. This death was due to infection, but because of the wound disruption local anesthesia cannot be eliminated as a contribut ing cause of death

Case 4—An elective Kröniz operation with sterilization was performed on the patient M. H., who had had two previous reserv in sections. Eleven hours after operation, a fall in blood pressure and a rise in pulse was noted. There was no bleeding After plasma and whole blood transfusion her condition was excellent. The day after operation there occurred a partial collapse of the right lung. With the use of carbogen this condition cleared up. From this time on the condition remained satisfactory except for a low-grade temperature until the thirteenth day after operation when the patient died suddenly of pulmonary embolism

It is generally accepted that pulmonary and embolic complications occur much less frequently following the use of local anesthesia than with inhalation anesthesia. This death demonstrates, however, that they can and do occur

One of the chief advantages of local anesthesia is that there is rarely any delay in resuscitation of the fetus. This was borne out in our series of cases

Six neonatal deaths occurred, a fetal mortality incidence of 2 3 per cent. In three cases where placents previa was the indication for the cesarean section, the infants died on the minth day after delivery by cesarean section for abruption placentae. Erythrobiastosis fetalis caused the

death of one infant and another died at thirtyeight hours from cerebral malformation. As is usual, all of the fetal deaths occurred as a result of the maternal complication which gave rise to the indication for cesarean section or as a result of congenital anomalies

In conclusion, it may be stated that the advant uses of the technic listed by Beck in his original description have been borne out in our four years of experience with it. There were no immediate deaths attributable to the anesthetic agent. The only case of bleeding from the placental site was one in which a piece of placenta was left behind.

The general condition of the patients immediately after operation was almost uniformly excellent and their convalescence gratifyingly smooth Dehydration was rarely seen because the patient could take fluids before, occasionally during, and immediately after operation

In spite of the fact that many of these patients had eaten only a short time before operation, vomiting rarely occurred. When it did occur, the danger of aspiration pneumonia and plugging of the bronchi was not present because the patient was conscious at all times. Intestines were seldom seen or handled during the operation

Soft diet could be taken within a few hours after operation. Hence, distention and gas pains were very infrequent

Embolism occurred in only one case

The absence of delay or difficulty in resuscitation of the fetus is stressed above

The fact that local anesthesia requires gentle handling of the tissues is felt to be an advantage

It must be admitted that there are some patients too highly excitable, almost morbidly fearful, who are not suitable candidates for local anesthesia. With experience, these patients can be recognized and another anesthetic agent elected. Also, with experience, the operator will find that the number of such cases that should be excluded will diminish. Then, it is felt, the incidence of failures will be materially reduced.

After proper selection of patients, the only disadvantage is that the operation is time consuming and tries the patience of the operator. With practice, the technic can be mastered and will be found eminently satisfactory.

ARE AMINO ACIDS NEW MIRACLE DRUGS?

Protein hydrolysates and amino acid mixtures are rapidly becoming as notorious as the vitamins. New and astounding claims of therapeutic or nutritional virtue appear in the press and even in some professional publications. No doubt amino acid therapy has a definite and useful place in medicine. Even the most enthusiastic proponent of the virtues of the amino acids will be astounded, however, at the therapeutic results claimed for the preparation marketed by Vincent Christina & Co under the name "Aminogen" (not to be confused with "Amigen"). According to an advertisement appearing, as might be expected, in Modern Medicine, "Aminogen" should be used in the treatment of gastroduodenal ulcers. This in itself is not remarkable, since CoTui and others have claimed benefit in such cases by the administration of amino acid mixtures orally. However, "Aminogen" is claimed to be so miraculous in its curative powers that, when given in 2 cc amounts intragluteally, it "aids in restoring normal protein plasma levels," "aids protein regeneration," "encourages hemoglobin formation," "eliminates mus-

cular spasms," "controls pain," and "hastens ulcer healing" Just how 2 cubic centimeters of an amino acid solution, even if given hourly, could have any measureable effect on the "protein plasma level" or aid protein regeneration is not explained Perhaps moistening the tongue with beef broth might accomplish the same benefit without the inconvenience of an intragluteal injection, and it would taste better! The antispasmodic and analgesic actions of small amounts of amino acids have not heretofore been re-Have the competitors of Vincent Christina ported & Co overlooked these properties? Such claims do not appear in the advertisements of competing prod-Vincent Christina & Co seem to be striving for a reputation in making exaggerated and unwarranted claims for unscientific products "Aminoranted claims for unscientific products "Aminogen" and the claims made for it approach the acme in quackery Isn't it unfortunate that the terms of the Federal Trade Commission Act do not permit adequate control over such advertisements when they appear in professional publications?—Current Comment, J.A. M.A., September 7, 1946

LARYNGECTOMY AND ITS PSYCHOLOGIC IMPLICATIONS

JAMES S GREENE, M.D., New York City

(From the National Hospital for Speech Disorders)

HE first successful laryngectomy is said to have been performed by Billroth in the early Since that period, when the operation was almost invariably fatal, the treatment of the patient with cancer of the larvnx has progressed through three phases During the initial phase emphasis necessarily was centered on improving surgical technics, with such excellent results that today operative mortality is practically nilsecond phase was a natural sequel to the first, for with improvements in surgical technics attention was directed to the development of methods to restore some measure of voice and speech to the patient who had lost his larvax. You are all undoubtedly familiar with the several devices and technics that have been evolved the various modifications of the reed type artificial larvay the electrolaryux, of more recent invention and the technic of producing esophageal voice, which is by far the most satisfactory method of developing a substitute voice and the one which we employ in our postlaryngectomy clinic.

Up to this point, interest had been focused for the most part on mechanics, both surgical and reeducational. But as it became evident that lar yngectomy had far-reaching effects on the patient psychologically as well as physically, attention turned increasingly to the psychic factors involved in the treatment and rehabilitation of

the patient with laryngeal cancer

Let no one underestimate the psychic trauma incident to laryngectomy It is equally as serious as the physical trauma itself. As one patient graphically expressed it "The victim of laryn geal cancer undergoes a radical metamorphosis the instant the laboratory brings in the ominous verdict. However stouthearted he may be, when given the choice between an early death and total removal of the voice box, he suffers a shock from which he never completely rallies

After the operation, he finds himself unable to make anything but unintelligible grunts. He cannot help being seized by terror and despair What will his life be like without a voice? What can he do for a living? '

In an effort to secure more detailed informa tion regarding the psychologic concomitants and sequelae of laryngectomy, we recently submitted a questionnaire to 70 patients in our postlar yngectomy clinic. Of the list of questions asked

Presented before the 140th Annual Meeting of the Medical Society of the State of New York, Section on Ophthalmology and Otolaryngology May 2 1946.

each patient, the five which elicited the most sig nificant data were the following (1) Did vou experience any fear, apprehension, or anxiety about your original hoarseness? (2) When you were finally given the correct diagnosis and told that you must lose your larvax, what was your (3) What were your experiences in the hospital before your operation, did anything happen to disturb you emotionally?, (4) How did you feel after the operation when you first tried to talk and found that you could not?. and (5) How did you react after the operation when you attempted to resume your old associa-

The incidental information elicited by the first question-"Did you experience any fear, apprehension or anxiety about your original hoarseness?"-was in many respects more significant than the specific answers to the query be expected, a majority of patients (41, to be exact) indicated that they felt no particular anxiety about their original hoarseness, ninetoen admitted that they had been worned almost from the onset of symptoms, while the remaining ten said that they became anxious only after the symptoms had persisted for a considerable period

those who admitted early two stated that their first symptom was difficulty in swallowing, which seemed to arouse apprehengion sooner than the much more common symptom of hourseness.

As a matter of incidental interest, we noted in each case the length of the period between the onset of symptoms and the final diagnosis. This ranged from a few weeks to a year or more-and in one case to seven years! In this last case, the early diagnosis had been "nerves," apparently because the hoarseness fluctuated in seventy The patient, a woman of 40, explained The first doctor who voice would come and go examined me gave me a prescription for nervous-I tried this for a few months and then went to another doctor This way around took me to twelve different doctors, and I still was not getting better The last two doctors sent me out west to a dry climate. At the end of two years I returned no better for my sojourn in the west.' Other diagnoses reported were colds, laryngitis (seemingly the early diagnosis most often made). "bad tonsils," "voice strain," "throat irritation,
"bronchitis," and "sinus trouble" This all points up an urgent need to educate not only the

public but the general practitioner to the possible significance of voice changes

In the majority of cases studied, the diagnosis of cancer came as a complete shock, since the patient had not been led to take his symptoms too seriously. It is at this point that psychic factors begin to dominate the picture, as indicated by the replies to our second question In answer to the query—"When you were finally given the correct diagnosis and told that you must lose your larynx, what was your reaction?"-19 of the patients indicated that they had accepted the verdict with what might be termed philosophic resignation, several of these, however, mentioned that they had not fully comprehended that the voice would be gone permanently Fifty-one of the patients, or more than two thirds, reacted by becoming acutely depressed and apprehensiveto the extent, in at least 3 cases, of seriously contemplating suicide "I nearly went crazy," one patient explained "I was like someone going to the execution," another recalled other said that he felt he might "just as well go out the window," adding, "I almost wished it was my heart instead" A fourth related was so upset at first that they were unable to operate until my fifth day in the hospital"

The next question—"What were your experiences in the hospital before your operation, did anything happen to disturb you emotionally?"elicited the information that in a number of cases the patients were not prepared psychologically or the operation, and the paucity of details they eceived contributed greatly to their anxiety and pprehension One patient related "I could lot find out anything definite from any doctor to lear the haze, and never once received a positive inswer to the simplest of questions. It was not intil I was in the midst of the operation, and leard the doctor and his assistant discussing the case, that I learned my voice was to go, that, in fact, my larynx was already out"

Another patient understood that he was undergoing a tonsillectomy and discovered what had actually happened only when he tried to talk to his nurse after the operation He spoke of this later as the "most brutal thing" that had ever been done to him. The shock was so great that when he came to our postlaryngectomy clinic a year or more after his operation, he was still deeply resentful and referred in the bitterest terms to the surgeon who had performed the laryngectomy

Conversely, a number of patients mentioned that prior to the operation they had received a full explanation of what was to happen and were grateful for it Several spoke appreciatively of visits they had received from people who had undergone laryngectomy and had learned to talk

This seems to be the most valuable type of preoperative reassurance and helps immensely to prepare the patient psychologically for the laryngectomy However, care should be taken in the selection of the visitor. One of the patients in our study disclosed that he had been called upon by a man just beginning to talk again and that the raucous noises his visitor made in attempting to speak were more discouraging than reassuring Another patient mentioned that the nurse who attended him had undergone laryngectomy several years before and had been completely voiceless ever since, the prospect of facing

a similar fate was acutely depressing

Our fourth question—"How did you feel after the operation when you first tried to talk?"concerned the patient's reactions immediately following laryngectomy The replies indicated that it is at this stage that the patient is at the lowest point of depression Only 7 out of the 70 patients reported that they were not greatly discouraged, of these, one had suffered severely for some months prior to the operation and recalled that she was "so grateful for the relief that nothing else mattered" The remaining 63 patients declared that they were extremely depressed, and approximately one third of these mentioned that worry about holding their jobs added to their depression It was noted that this fourth question elicited more emotionally charged answers than any of the others These replies were couched in such terms as "I was completely desolated, they told me it might be worse, but I couldn't see how " "I just about went insane" didn't care about living any more, the future was black " "I was in the depth of misery, it was all just too terrible to think about "

We were interested further in learning what continuing effects the loss of his larynx has on the patient's personality, more particularly, to what extent and in what direction it influences the patient's interpersonal relationships after he returns to his old environment Questioned in this regard, more than half of the patients reported that on meeting former acquaintances they were depressed and sensitive and became seclusive, a number mentioned that they avoided even their best friends Several patients stated that, while they did not attempt to withdraw from contact with others, they had definitely grown more irritable Some who had purchased artificial larynges revealed that the use of such devices increased their sensitivity, one patient declaring "I felt like a brand new circus freak."

When the patients were asked how they reacted to the news that they could learn to talk again without mechanical aids, almost without exception they reported a resurgence of hope and optımısm

It is at this stage in the rehabilitation of the patient who has lost his larvax—that is, when he comes for training to develop a substitute voicethat the influence of psychic factors is perhaps most apparent, because at this point they can actually and very definitely hamper treatment We have observed that the patient who is abnormally depressed, sensitive, and anxious has much greater difficulty in developing a substitute voice than the patient who psychologically is better adjusted to his handicap Probably this can be explained on the basis of neuromuscular As you know, in learning to speak again, the nationt who has undergone larvagectomy must aspirate air into the esophagus by a contraction of the sternohyoid, thyrohyoid genichyoid, mylohyoid, and the anterior portion of the dignstric muscles, and then cructate-coordinating the process of eructation with articu lation.

The entire procedure must at the same time be coordinated with respiration. This at best is difficult for the beginner, and the necessary coordination is all but impossible if the patient is a prey to destructive emotions and the neuromuscular tensions they generate. Sometimes these tensions are so pronounced that they produce marked esophageal spasms which effectively prevent the individual from making any sound

We have observed that among the principal factors influencing the patient's psychology, and hence his adjustment to the loss of his larynx and his response to voice training, are his personality and vocation before the operation, as well as his social and economic status. The psychic trauma incident to laryngectomy, as might be expected, tends to exaggerate certain personality traits. Thus, a person who before laryngectomy was anxious, sensitive and retiring, becomes more anxious, sensitive, and seclusive after the opera tion and has greater difficulty in mastering the new voice technic Similarly the patient whose vocation centered attention on his voice, for in stance, the person who has been a salesman, teacher, or lecturer, or the patient on a higher social or economic level, frequently is more sensi tive and anxious following laryngectomy than (let us say) the day laborer, because he has suffered greater ego deflation.

The case of the youngest patient in our senes illustrates to what extent the loss of the larynx may affect the whole personality, and how fear and anxiety may interfere with the acquisition of a substitute voice An attractive young woman of 25 the patient in question discovered that she had cancer of the larynx when she was a bride of only two months. She underwent laryngectomy shortly thereafter Describing her feelings fol lowing the operation, she related

"When I was actually faced with the knowledge that I could not speak again, it just about finished me I did not want to see anyone or do anything I felt that my future and my marriage were rulned I could foresee my husband a love changing first into pity and then into aversion. I had been shown an artificial larynx, but it so disgusted me that I would much rather have remained mute than use it. Then I heard of the postlaryngectomy clinic at the speech hospital and enrolled in it. At first I made no progress, because I was so depressed and felt so completely hopeless. My husband, a captain in the Army Air Force, had just been shipped west and I had not heard from him in two or three weeks. I was sure that he had decided to leave me My imagination pictured him saying Now that I m away I'll stay away She's disfigured, she will never be like a normal girl.' But finally, after agonizing days and nights, during which I oried most of the time I received a letter from my hus-He had been unable to write before and assured me that I still was the only girl for him My spirits lifted and my speech work progressed so rapidly that, as you know, I m now ready to be discharged "

Inasmuch as psychic factors do play such a vital role in the rehabilitation of the patient who has lost his larynx, and since these factors become operative at the moment that the diagnosis is interpreted to the patient, I should like to make a few recommendations. These are based not only on the results of our detailed study of 70 patients, to which I have referred throughout this discussion, but also on the general observa tions we have made in working with some 200 patients in our postlaryngectomy clinic over a period of several years. The principal suggestions I would make are

The patient with cancer of the larvnx should be told frankly, before the operation, that his larvnx must be removed and exactly what this will mean in terms of losing his voice and curtailing certain of his activities I recommend this procedure because the patient is in a better condition, physically and psychologically, to cope with the shock of the complete revelation before the operation than he is following it. Our study revealed that those patients who had been given a frank, complete, and sympathetic explanation of what was in store for them regained their equilibrium more quickly than those who were unprepared and discovered the full extent of their misfortune only after the operation.

Before the operation, the patient should be visited by someone who has undergone larvagedtomy and has developed a good speaking voice. This is one of the most effective means of reassurance, and as such is a valuable preoperative mental hyriene measure.

The same person should call on the patient immediately after the operation, because at this

stage, our study indicated, the patient is at the nadir of his depression. As one person stated, "It's all right to say to yourself before the operation that you won't speak again, but when it actually happens it deals you a staggering blow"

4 As soon after the operation as the surgeon deems advisable, the patient should receive voice training, and this should be carried out away from the hospital in which the operation took place, with all the tragic associations it holds for the patient

5 The rehabilitation program should embody psychologic as well as re-educational measures In this connection, group therapy, supplemented, of course, by individual work, will be found most effective, because it gives the patient valuable psychologic support. It brings him in contact with more advanced patients who serve as models and sources of encouragement. The progress which more advanced patients have made counteracts the effects of any initial difficulties the new member of the group may experience. Furthermore, through association with others in a similar plight, the individual realizes that his position, while unfortunate, is not unique, and this realization in itself materially helps him to adjust to his changed status.

61 IRVING PLACE

THE PASSING OF THE FAMILY DOCTOR

Mountin showed that, as early as 1938, not only were rural practitioners decreasing in numbers, but they were older than their urban confreres. His study indicated both that fewer graduates were locating in smaller towns and that many of the younger physicians who originally located in rural areas were migrating to the larger cities.

In the June, 1946 issue of the Journal Lancet, it was shown that North Dakota with 641,935 population has 363 physicians, South Dakota with 642,961 population has 334 physicians, Montana with 559,456 population has 361 physicians, and Minnesota with 2,792,300 population has 2,565

physicians

Smith, Executive Secretary of the Nebraska State Medical Association, in the July issue of the Wisconsin Medical Journal said, "As it looks from Nebraska, the medical profession has an unrecognized number one problem—the threatened extinction of the general practitioner— The seriousness of this situation is more evident in the rural areas and smaller towns—Older men are retiring or are removed by death, and are not being replaced by younger men—This is a blow at the very foundation of medicine

Contributing to the searcity of physicians rurally and their concentration in the larger cities is the trend toward specialization. In 1941, it was found that of 175,382 physicians in the United States, 140,000 engage in private practice, and of this latter number 36,483 limit their practice to various specialties. In 1946, it was found that 30 per cent of

practicing physicians are full specialists and 20 per cent are partial specialists, leaving only 50 per cent of practicing physicians in general practice.

of practicing physicians in general practice. The American system of medicine always had had the general practitioner as the very hub of its machinery. Family doctors are an essential part of the economy of American families. Transportation and communications systems have not been developed to a point were general practitioners should be allowed to decrease in number. Neither should the necessity of general practitioners be overlooked in solving the increasing costs of medical care. How much will medical care cost as the public is forced to seek its medical care from one specialist after another instead of from the family doctor?

This continuing decrease of general practitioners should be recognized as the greatest problem of organized medicine in this country at the present time With its proper solution will come correction of maldistribution of physicians, decrease of the high cost of medical care, and higher quality of medical care

uniformly over the whole country

Unless the medical profession, itself, provides the answer in the not-too-distant future, some governmental agency will be given control of both medical education and medical practice in order to permit compulsory placement of physicians in rural areas Would it not be far better to accept the challenge now, and to see that the profession provides the answer in a democratic manner rather than permit forced regimentation?—E J S—Journal Lancet, October, 1946

PERENNIAL VASOMOTOR RHINITIS A MODERN APPROACH TO DIAGNOSIS AND TREATMENT

F HOWARD WESTCOTT M.D., New York City

(From the Allergy Climic of the New York Fye and Ear Hospital)

ASOMOTOR rhinitis constitutes a large per centage of the cases referred to the allergist from the nose and throat specialist. This has become more and more prevelant as the nose and throat surgeons have discovered the futility of treating these patients by any of the local forms of therapy now available and generally acceptable to them

At the moment, varomotor rhinitis has attained about the same place in the nose and throat office as neurocirculatory asthenia and essential hyper tension have acquired through the years in the medical or internists' practice Without a doubt. it is a definite entity as far as the patient is con cerned and the symptoms are quite consistent and constitute a disease to them even if it is must a symptom complex to us

One may well question my right to speak on such a subject, but I am drawing on my experience of the past fifteen years in the allergy clinics of two large general hospitals and one very active ear, nose, and throat hospital where I have had the most complete cooperation of the visiting staff and the advantage of having resident nose and throat interns at my elbows at all times

In the past twelve months, our average daily clinic attendance has been 45 cases and the aver age number of these patients with nonseasonal rhinuts runs about 32 per cent without hay fever and 28 per cent more with both vasomotor rhi nitis and seasonal rhinitis, or hay fever remaining 40 per cent, approximately 5 per cent were authmatics, 7 per cent were upper respiratory infections or cases of sinusitis which failed to respond to all previous forms of local therapy, 13 per cent, miscellaneous forms of allergy including migraine, dermatons, etc. and 15 per cent were nonallergic cases and were not accepted or failed to return for further study

Diagnosis

Diagnosis of vasomotor rhinitis depends a great deal upon the description of the symptoms reported by the patient, and differs very slightly with those described by characteristic cases of seasonal rhinitis or hay fever To clarify the picture these complaints usually include a watery nasal discharge with alternate obstruction and patency on either or both sides, mucoid moist nasal discharge with periods of mucopurulent content, and often times, periodic bouts of ancezing and itchy nose

In detailed anamness we find that there are certain times when these symptoms are completely quiescent and others when they are mild and again severe There is no consistency, how ever, either in the individual cases or in the group as a whole but it seems the early morning and evening are ant to be worse, and also during the change in seasons and at the full or ascending

When these patients present themselves at the nose and throat office or clinic, the problem is usually one of differentiation between vasomotor rhinitis and the presence of some organic local pathology which can cause these same symptoms It is therefore, imperative before so classifying the patient to be sure that there is no low-grade mucous membrane infection in the upper respiratory tract or any gross deformity or distortion in the passages, presence of tumors or evidence of overuse of decongestants sold over the drugcounter by radio burleague, or prescribed by too busy general practitioners for temporary relief until they could "look them over "

The diagnosis is therefore dependent on a positive history and an essentially negative physical examination A description of a so-called "typical allergic membrane" varies with almost everyone's capacity to describe color changes and degree of swelling, but many of them do show a boggy, swollen, moist membrane varying from a pale pink to a turbid, purplush hue depending upon the stage of edema, venous congestion, and secretory state then present In uncomplicated cases, no purulent secretion is present but dirty. yellow crusts of old dried mucoid secretion may lurk in dependent areas, especially under the turbinates.

X ray and transillumination studies may also show some harmess in the antra and other sinus spaces but invariably they are reported as "clear returns" after urigating. In many instances definite diagnosis of thickened membranes can be made by the experienced x ray interpreter Smears of the secretions have been advocated by many to determine the ecamophil per cent of leukocytes, but in routine studies of 44 cases the average smear only revealed 45 per cent with in

Presented at the 140th Annual Meeting of the Medical Society of the State of New York, Section on Ophthalmology and Otolaryngology May 3 1946

TABLE 1

	Tests to Inh	alants)F	oods——		otal
Type of Case	Number of Cases	Marked	Marked	Moderate	Positive	Negative
Allergie Infectious Combined	79 10 11	(86%) 70 (other than dust) (50%) 5 (other than dust) (82%) 9 (other than dust)	30%	36%	66%	34%

creased eosinophil present, and I do not depend upon nasal smears unless to determine a frank preponderance of pus cells (leukocytes)

Allergic Aspects

Allergic aspects of vasomotor rhinitis should be first investigated after a tentative or definite diagnosis has been established by the above criteria. Here an entirely different angle of approach is attempted and a relationship between symptoms and the patient's daily life habits, environment, response to change of atmosphere, foods, drugs, and emotional reactions must be considered. A careful history is of utmost importance because many short cuts in the allergy study are possible by reason of intelligent exclusion of unlikely potential allergens, i.e., testing for animal danders, orris, silk, etc., in absence of reasonable contact

In definitely suspicously allergic or hypersensitive persons, a history of some other allergic disorder in the family background is enough to cause a suspicion of allergy and the presence of migraine, urticaria, hives, eczema, asthma, etc, is very strong supportive evidence

In the absence of any of the preceding factors, we are apt to be faced with a completely negative set of skin tests to all the usual foods and inhal
set by any technic used, provided the extracts

Lives are not irritants as is true in many

especially among the foods

To make any semblance of consistent diagnosis by skin testing, the operator must be well acquainted with his extracts and have used them frequently, recently, and under controlled conditions. A review of results in routine skin testing (50 chinic and 50 private cases) done under such conditions reveals the facts shown in Table 1 regarding their value as a diagnostic aid in vasomotor rhinitis

Allergic cases averaged three marked inhalants and 8 per cent showed significant reactions to dust alone — Eighty-five per cent of the cases had dust as a major allergen by skin testing

Another aid frequently employed as of diagnostic value is the degree of eosinophilia found on nasal secretion and in peripheral blood

Nasal smears on 44 persons revealed 13 allergic cases or about 30 per cent with no eosinophilia present and 11, or 25 per cent, with only occasional or a few, and the remaining had moderate to marked per cent of eosinophils present. This seems to indicate that nasal mucoid secretion need not necessarily have a high degree of eosin-

ophils to be of an allergic nature, but that when a high percentage is found it is presumptive evidence that we are dealing with an allergic disorder Not infrequently, however, a high eosinophil count is found in the presence of a bacterial invasion along with a high per cent of pus cells At the present time, we are not doing nasal smears routinely in cases that have enough other positive findings to put them in the allergic catagory for treatment Blood counts of 70 patients showed that 52, of 70 per cent, have from 0 to 4 per cent, and 18, or 30 per cent have from 5 to 20 per cent Here again any abnormal count must be only presumptive evidence because such a high percentage of these proved allergic patients had what we consider a normal blood differential count

Sinus x-rays are required on all clinic cases before being accepted for treatment, and all private patients were either x-rayed or said to have clear sinuses by a competent nose and throat surgeon, who usually had both x-ray and clinical examinations on which to base his statements. Among these 100 cases, x-ray reports were seen on 97 and these revealed 53 to be clear, 18 to be slightly cloudy or slightly thickened, 22 to be cloudy, and 4, very cloudy or thickened

During the past few years when such a large percentage of my clinic practice has consisted of these cases of perennial rhinitis, my general impression was that most of them were responding poorly. However, after reviewing these 100 consecutive cases, I realize that this impression was erroneous. It was undoubtedly predicated on the fact that most of these patients respond to practically all local and new therapeutic measures when first administered, but the symptoms quickly return even during the period of treatment. This fact is well illustrated by a review of results in using the following drugs (50 cases)

Potassium chloride
Ascorbic acid (vitamin C)
Cortalex (adrenal cortex)
Chlorophyl (physiologic)
Benadryl
Anthallan
45% improved 55% no change
50% improved 40% same
60% improved 45% same
60% improved 45% same
60% improved 40% same
20% improved 80% same

My present opinion on the result of treating perennial rhinitis is more encouraging. I am re-

porting 55 cases as improved and 15 cases as un changed or too alightly improved to consider a positive change. Unless some very definite en vironmental inhalant or ingestant factors are uncovered which are specific, and whose removal allows almost immediate relief, the usual course of therapy results in slow unprovement. This im provement depends upon the duration and sever ity of the symptoms, and the number of contribu ting causes. The more complicated the en vironment and more obscure the cause the slower the response to treatment

It is my feeling that the best results are obtained when a standard minimum diagnostic study is undertaken based upon the principle set forth in this report, and then a therapeutic program based on this study should be intensively and carefully followed. An average plan of treatment should include the following

1 Avoid the given list of positive skin reactive substances including inhalants foods drugs, animal danders, cosmetics, etc

2 Avoid too frequent and drastic changes in

environment, especially drafts, changing tem poratures dampness excessive dryness, air cool ing etc

Follow a given nonallergic diet made up of negative skin test foods plus known nonchnically

Use nonallergic cosmetics, cover all pillows with nonnerous covers, stop smoking and avoid house dust, house pets, etc.

Desensitization with the indicated substances, which in 93 per cent of cases consisted of house dust, feathers, orns, animal dander, and catarrhal vaccino

High vitamin A dosage-50,000 to 100,000 units a day in all bacterial cases and high vitamin C. 100 to 500 mg a day in inhalant cases.

Contrast baths and histamine desensitization to thermal or physical allergies

Nonspecific measures for all those for which specific therapy could not be recommended, and the temporary use of antiallergic drugs for symptomatic relief

130 East 67 Street

DOCTOR URGES HEART PATIENTS TO LIVE NORMAL USEFUL LIVES

A Philadelphia physician states that many patients who have serious complications of the heart can be reassured and allowed to live normal lives according to the October 19 issue of the Journal of

the American Medical Association.
William D Stroud M.D., who is on the board of directors of the American Heart Association points out that there are ' many murmura, especially in the pulmonic area, which are absolutely of no impor tance from the standpoint of circulatory efficiency or length of life. In fact, many children with definite valvular damage live the full span of life and others do not develop circulatory insufficiency until the third fourth or fifth decade. Certainly their lives can be much happier if their physical activities are unrestricted and I doubt whether the normal physi cal activity of childhood plays any part in the progress of the pathologic lexion.

Medicine can aid patients with heart trouble to

lead practically normal lives, according to Dr Stroud. "Most people with coronary insufficiency know the things that bring on pain such as walking after meals or in cold weather against the wind, he states. "If it is necessary for these persons to make such effort, it is perfectly possible for them to ward off an attack by dilating the coronary vessels with a tablet of glyceryl trinitrate before making such an

Dr Stroud is of the opinion that patients with heart trouble should be permitted to smoke and

"Most people who smoke know whether or not they are sensitive to nicotine," he said "If a man is not senstitive to nicotine I believe it is perfectly safe for him to smoke. However sensitive or not, in the presence of angina of effort or a healed coronary occlusion if a person is having substernal pain I believe eliminating tobacco will tend to lessen the frequency of attacks of pain

Many physicians advise patients with hyperten-discase not to drink. To myself is seen or reason why patients with these conditions should not drink in moderation. Many patients with anguna of effort secure as much relief from brandy or whisken as they do from glyceryl trinitrate and I can see no reason why they should be deprived of the pleasure of drinking unless there is some evidence that alcohol is injurious.

The author holds out further hope for the heart disease patient by concluding in this optimistic tone I feel that the average patient with a healed coronary occlusion can return to a sedentary occupation part time in about three months. Although it is debatable, because of the possibility of further occlusions, I believe it is safe to allow such patients to drive a car three months or so after their acute episode Also if they do not have angine of effort three or four months after their original attack any mild form of exercise such as golf or swimming in warm water seems indicated, is desired. It is my feeling that too many such patients are made total invalids unnecessarily In fact it is my experience that after adequate collateral circulation has developed it really doesn t seem to matter what activi-ties these persons carry on within reason from the standpoint of developing further coronary occlu-sions. Certainly a patient is a happier and more useful member of his community if he can lead an approximately normal life.

TREATMENT OF BATTLE FRACTURES OF THE SHAFT OF THE FEMUR

JOSEPH D GODIREY, M D, Buffalo, New York

COMPOUNDED fractures of the femoral shaft challenge the faculties and facilities of surgeons as do no other fractures. From the management of "battle fractures" we may very well augment our knowledge. It is with this in mind that significant facts, gathered from a relatively large experience in the handling of such, are herewith presented.

The object of complete, uninterrupted immobilization with maintenance of length and position followed by bony union seemed a will-o-thewisp in many cases. The resultant stimulus produced modifications in management and, from our observation post, an earlier and more satisfactory approach to the reparative, surgical program

Audacious surgery, blood volume restoration, and antibacterial therapy initiate the casualty to his planned program of repair much earlier in his convalescence

Penicillin became available in the spring of 1944 and this series of 54 cases represents the first to have the added protection afforded by the routine administration of the drug in a planned program

Surgeons, assigned to hospitals administering primary treatment, cannot be too highly commended for their expeditious and effective accomplishments. Over 85 per cent of those wounded were operated on within the first twenty-four hours.

Debridements were thorough, obviously devitalized soft tissue was excised, loose or perilously attached bone fragments were removed, mass ligations were avoided, incisions and wound extensions were in fascial planes, missiles were removed insofar as was practicable, pockets and recesses were obliterated, the integrity of the vascular tree was surveyed, nerve supply was evaluated and dependent drainage for wound debris was provided for, if, and as possible

Casts were, and should be, informative Better than two thirds of the compounding agents were high explosive fragments These, spinning as they penetrate and perforate, are more apt to carry in a greater variety of contaminants than the less innocuous, relatively smooth bullet

Copper sulfate series were routine on admission and a request for 500 cc of whole blood accompanied the blood sample. This was the minimal amount for replacement therapy in these fractures. Values reported dictated the quantities of whole blood to follow.

Hematocrits ranged from 20 to 47, the average being just over 30 The detailed breakdown was

	Percentage
20-24	19
25-29	19
30-34	26
35-39	19
40-and above	17

Blood restoration called for the administration of these amounts

Cc	Percentage
Under 1,000	34
1,000-2,000	34
2,000-3,000	17
3,000-4,000	6
Over 4,000	9

Reactions were remarkably few when one considers the operational difficulties and tempo of a service providing care of such magnitude to the seriously wounded

Penicilin was administered in doses of 25,000 units every three hours. Days of administration averaged twenty-two days—a long period, in the light of present knowledge, but we felt that it was better than too brief a course, especially when dealing with wounds often necessarily and purposely left open

Radiologic studies were carried out as indicated The average wounding-to-reparative-surgeryinterval was under ten days in over two thirds of the cases

Restored to satisfactory physiologic balance, the patient was ready for reparative surgery. The distal thigh and proximal leg were prepared and a Kirschner wire was drilled, slowly, through the distal femur or tibial tubercle. In the former, if the fracture was above the lower third of the femur, in the later, if the fracture was below the junction of the middle and lower thirds. Passage of wire through traumatized tissue was avoided if possible.

A traction bow was applied and the extremity suspended in the 90—90—90, or vertical traction position, by means of the overhead, or so called "A" frame The entire operative field was then prepared This advantageous operative position affords excellent access to all quadrants of the thigh, it is a most adequate means of controlled traction and defines the fascial plane approaches very well

Smears and cultures were taken from the superficial and deeper strata In the light of the monumental work done by Dr Champ Lyons, on a routine run of contaminated wounds, our bac-

Presented at the 140th Annual Meeting of the Medical Society of the State of New York, Section on Orthopedic Surgery, May 2, 1946

tenelogic studies did not justify any conclusion beyond the fact that contaminants were many and varied

The operator is the appraiser of the wound He alone determines its necessities, possibilities, and potentialities

Cardinal principles of wound management cannot be overemphasized Gentle and meticu lous handling of all tissue is a necessity for no claim is made that antibacterial therapy will prevent the septic decomposition of devitalized tissue, nor will it sterilize retained hematomata Ameontractile muscle was eliminated by sharp dissection, bleeding vessels were lighted without encompassing adjacent soft tissue hematemata were removed and the depths of the wounds in rigated from within outward with copious amount of saline. All pockets and recesses were climi-True, another hematoma undoubtedly formed but it was felt that its sentic possibilities could be safely neutralized by administration of the antibacterial substance Loose bone frag ments, and those with dubious periosteal attach ments, were removed

Twenty per cent of the cases required minimal tramming before closure and only 5 cases or 10 per cent required more extensive surgery. In these 5 patients, the wounds were left open until the fifth to seventh day and then closed. Approximately 70 per cent were adjudged clean and ready for closure on original inspection in base hospitals. Well-débrided wounds provided ex cellent access to the fracture zone.

Twenty-three cases were rigidly internally fixed in anatomic alignment, 15 through the original wound, 8 through elected posterolateral incisions. Four cases were immobilized by means of the Roger Anderson apparatus. Twenty cases were treated with skeletal traction only. The Army half ring splint with Pierson attachment was standard. Traction on a posteriorly displaced, distal fragment was accomplished with a wire and bow combination pulling at right angles to the shaft. Seven were immobilized in one and a half spicae, post-operatively.

As throughout, the judgment of the operator again determined the extent of the closure to be done. Considered were the feasibility and mechanics of endothelm fascial, cortical perfected, and tendinous coverage, the obliteration of dead space, provision for dependent drainage and skin coverage. Relaxing incisions, flaps, and grafts played significant roles at this juncture.

End-on mattress sutures of black silk were favored as they approximated deep and superficial layers, and removal left no nonabsorbable suture material buried in the depths of the wound Where necessary "OO' and 'OOO' chromic gut were used in the deep layers.

The posterolateral fasciotomy, as an incisional approach to the femoral shaft, follows fascial planes, provides excellent exposure, leaves an exit thoroughfare for wound debris, and, having served its purpose, will close spontaneously and well, without autures.

Fine meshed gauze, fluffed into the wounds, proved to be superior to vaschine gauze, or the usual rubber drains

Dressings should be copious, soft, and so applied as to exert a steady, evenly distributed pressure

Postoperative traction varied in direct proportion to the amount of muscle loss. Positions had to be checked frequently and the short, abducted, and flexed, proximal fragment necessitated shifting the distal fragment to align with the proximal in a few instances.

Postoperatively, copper sulfate senes determined the necessity for the intravenous therapy, and replacements to good physiologic levels were the order of the day

Physiotherapy was instituted when advised by the attending with particular stress on development of the inevitably poor quadricons

Nutrition played a major role and it was noted that, quite consistently, these patients lost ten to thirty five pounds. Muscle mass and tone decreased wounds failed to heal, and, without evidence of gastrointestand disease, hematocrit, hemoglobin, and plasma protein levels fell.

A dietary survey, based on 200 figures, speaks for itself in comparing available and ingested food

	Avnilable	Ingested
Proteins	99.2	81 1
Carbohydrates	391.8	294.9
Fats	122 1	102.2

Obviously, protein levels were dangerously low and after augmenting the diet, these were the values

	Available	Ingested
Proteins	129 7	114,85
Carbohydrates	386 0	205 1
Tats	150.8	131.5

This relatively small series did not justify iron clad conclusions but it did stimulate a greater, more comprehensive, and inclusive survey. More proteins were made available and the wounded gained weight, appetites improved, and, most important, wounds healed ever so much more rapidly due to a positive balance fostering new tissue synthesis.

Results

1 Conclusive and final evaluation of this series is pending but follow-up records received on 60 per cent are most encounging

- 2 Our average observation period was eighty days postwounding
- 3 Five cases returned to the States with draining sinuses Three of these closed and have remained so Two are, as yet, unreported
- 4 Two patients developed abscesses, one at five weeks, the other at seven These were drained, clinically, they did not communicate with the fracture zone, and both healed without incident
 - 5 There were no deaths
- 6 One amputation was at midtibia for dry gangrene secondary to a femoral artery severance and ligation. This was performed three months after admission with the femoral fracture well "frozen"

Conclusions

1 The pillars of management of compounded fractures are adequate, bold surgery, maintenance of excellent physiologic balance, and the

intelligent use of antibiotics

- 2 The posterolateral fascial plane dissection is an excellent avenue to and from the femoral shaft
- 3 The 90—90—90, or vertical traction position, provided unsurpassed access to all portions of the thigh and traction is easily maintained
- 4 Internal fixation does have a place in management of selected compounded fractures but one must weigh its advantages against the disadvantages scrupulously. It is an aid in soft tissue care and *must* not be performed for the sake of internally fixing these fractures.
- 5 Dietary deficiencies cannot be tolerated as new tissue synthesis is impossible if the patient is in negative balance
- 6 If there is a question of serious septic possibilities, staged or delayed closure may be employed to insure success of the therapy

Note The preceding is essentially a preliminary report Nonavailability of complete follow up information of at least two years' duration, justifies reservation of certain opinions until these studies are completed

CAROTENE AND VITAMIN A IN THE BODY

In plants, vitamin A potency follows closely the yellow-orange color of fruits and vegetables sweet potatoes, carrots, and yellow turnips were active in curing vitamin A deficiency, whereas the white varieties were largely without effect. Soon the concept became established that the yellow plant pigments alpha, beta, and gamma carotene and kryptoxanthine were precursors of vitamin A in the body and that the transformation of these hydrocarbons to the alcohol vitamin A took place in the liver The latter conclusion rested on the observations of Olcott and McCann¹ that when liver tissue from vitamin A deficient rats was incubated with carotene, and the ultraviolet absorption spectrum of the brei was examined, there was evidence of the presence of vitamin A These observations were both confirmed and denied in subsequent studies Nevertheless, the liver has been considered the site of change of carotene to vitamin A. Several older studies have shown that when carotene is administered parenterally the vitamin A content of the liver is not increased. In a contribution to this subject, Deuel and his coworkers3 demonstrate that, whereas carotene given by mouth is effective in combating vitamin A deficiency without evidence of accumula-

tion in the liver, it has no effect in this situation when administered parenterally, although in the latter case there is active deposition of the pigment in the Furthermore, it was shown that there is no destruction of carotene in the intestine servations not only raise the question with respect to the alleged part played by the liver in the change of the hydrocarbon pigment to vitamin A but also point to the intestinal wall as a possible site for this transformation One needs only to recall the effective way in which the intestinal epithelium synthesizes fats from the products of enzyme hydrolysis of the fat in the food to concede that the foregoing ex-A sound concept of gastroplanation is reasonable intestinal physiology is the beginning of wisdom in Deviations in absorption play an imnutrition portant part in clinical syndromes such as pellagra or pernicious anemia and in other nutritional deficiencies —Current Comment, JAMA, October 5, 1946

DIVERGENCE INSUFFICIENCY AND PARALYSIS

LIAMES WATSON WHITE, M.D., New York City*

The BRINGING the subject of divergence insufficiency and paralysis to your attention it is not with the idea of adding anything to the etiology, nor is it an attempt to locate a center controlling the lateral divergence of the visual AXCS Anatomists and neurologists, as well as many ophthalmologists denied that a separate center existed to control the lateral divergence of the visual axes, but thought that this function was controlled by a relaxation of the converging function

When the visual axes converged excessively, it was frequently, and still is considered either an overaction of convergence or a paretic lateral rectus of one or both sides. In later years however, the presence of a diverging center has been granted as probable but the exact location and mechanism of the function is still in question

I heard the late John M Wheeler present a paper on this subject some years ago cussors discussed cases of paresis of the lateral recti

Duane, in 1905, discussed this and gave the classic findings which do not vary in character in any of the cases reported here, but vary only in the amount of deviation

The typical findings are an esophoria or esotropia, more marked at 20 feet than at 33 cm The deviation becomes less as the tests are made at distances within 20 feet. Duane found that the esophoria or esotropia reduced in almost mathematical accuracy until at 20 cm many cases exhibited an exophoria His tests were made for convenience at 20 feet 10 feet, 3 feet 0 50 M, and 20 cm

Since divergence is a distant function tests should be made at greater distances than 20 feet, often at 100 to 1,000 feet. Many cases that are an esophoria at 20 feet become an esotropia at some greater distance

If diplopia is present, it is homonymous however, there is no increase as the eyes are rotated from right to left, as in a paresis of a lateral rectus, but rather, there is often less in looking to the right or left than in the primary position A prism, base out, sufficient to fuse the images at 20 feet, is quite insufficient at some greater distance, for example a prism fusing objects at 20 feet will be insufficient for traffic lights a block or Oncoming automobiles will be double Prism divergence for distance, which is normally 3 to 9 prism degrees, with the majority varying 4 to 7 prism degrees, is less than normal and many cannot overcome I prism degree, base in. at 20 feet.

The diplopus can rarely be taken at the usual 30-inch distance as most cases fuse at this distance The test for diplopia is botter made at 20 feet.

The symptoms are, beside diplopia, asthenopia of the panoramic type, burning of the eyes and lids nausca, and headaches The symptoms are so persistent that many patients are classed as neurasthenics and go the rounds of ophthalmologists and neurologists. The vision is usually normal with correction possible when necessary The kind and amount of ametropia has little, if any, effect. It is possible to have an asthenopus. due to divergence insufficiency, increased by an ametropia, or to a vertical imbalance.

Prangen noted the frequent presence of a hyperphona. Many of my cases have shown a hyperphona, usually small in amount and frequently so comitant that no one elevator or depressor can be named, which makes the hyper phona seem more like a divergence in the vertical plane. In others the paretic elevator or depressor is easily determined. The symptoms are so per sistent and severe that many cases resort to vari ous types of drugs to relieve the pain.

According to Sherrington's Law of reciprocal innervation, when an abductor is stimulated, the direct antagonist or the adductor of the same eye is relaxed and vice versa.

When the right-hand rotators are stimulated the left-hand rotators are relaxed, and vice versa. Duane, and others, give this law as the cause in the development of a convergent strabismus. of the convergence excess type. That is, with an esotropia due to a convergence excess by reciprocal innervation the divergence function is in hibited and a divergence insufficiency develops. This seems to be so, but the symptoms are quite different, being less severe than those of a primary divergence insufficiency However, treatment should be carried on with the secondary diver gence maufficiency in mind

Cases with measurements much like those of a divergence insufficiency are the cases of convergence excess that have had a bilateral recession or tenotomy of the medial rect. The weakening

^{*} Deceased, May 18, 1946

Presented at the 140th Annual Meeting of the Medical Society of the State of New York, Section on Ophthalmology and Otolaryngology May 2, 1946.

of the medial recti may reduce the esotropia for proximity, more than for distance Such cases may be mistaken easily for cases of primary divergence insufficiency

The change in many cases from an esophoria or esotropia for distance to an exophoria at 20 to 25 cm. is an important factor in the treatment by either prisms or operation, as will be noted later

Any test that increases the converging effort is very apt to increase the esophoria for distance and nearness, often changing an esophoria to an esotropia. When this is done, all tests are unreliable for the time being and are better made at a later time. When an esophoria for nearness is present, the symptoms of a convergence excess may predominate. However, when there is an exophoria for nearness, with a remote near point of convergence, the symptoms of a convergence insufficiency may predominate. This is the reason why symptoms are often increased at close range.

When the esophoria or esotropia are the same for distance and nearness, a cycloplegic to paralyze the accommodation and the converging effort will lessen the esophoria for nearness, while the esophoria for distance will remain practically unchanged, if the esophoria is due to a divergence insufficiency

Treatment

Correct the ametropia, especially when hyperopic or myopic correction may affect the esophoria for nearness, and after the symptoms Prisms may be used to correct the esophoria, but if this is used at close range, the prisms may act as a constant converging exercise and increase the esophoria for nearness. This has been found in several cases, and also that when going without prisms for twenty-four hours, the esophoria for distance remained about the same, while the esophoria for nearness was decidedly reduced. When prescribing prisms in the distant glass, it is frequently necessary to have no prisms for nearness.

This is accomplished by having a near glass with a reduced prism, or none at all. The best arrangement is to have bifocals, with the segment having a weaker prism, or even no prism. Case histories will be given for emphasis

I have never had any result from orthoptic training in primary divergence insufficiency. However, in divergence insufficiency which is secondary to convergence excess, diverging exercises of any kind may aid, at least, in reducing symptoms

Operation

In cases with an esophoria or esotropia of 15 to 20 prism degrees, a shortening operation of the

lateral rectus of the nondominant eye has given the most satisfactory results

When the deviation is 20 prism degrees or over, it is better to operate both lateral recti. The medial recti should not be operated because of the frequent tendency to a convergence insufficiency, present before operation or developing later Re-operation is at times necessary, but should be confined to the unoperated lateral rectus, or to a re-operation of one or both lateral recti

Divergent paralysis comes on suddenly with other symptoms of a cerebral accident

One case of divergent paralysis recovered entirely, with the recovery from the cerebral accident. A second case had slight paralysis of one function or another, and finally died from what was described as a paralysis of respiration. Usually, the only immediate relief obtained is by occlusion of one eye combined with any systemic treatment that is indicated.

15 Park Avenue

Discussion

Franklin R. Webster, M.D., Syracuse—I will confine my discussion to divergence paralysis

Bielschowsky states that "Parinaud in 1883 was the first to describe the symptoms of divergence paralysis and since then many authors have confirmed his observations. Others, especially Berry and Alfred Graefe, have opposed the diagnosis, maintaining that the syndrome of divergence paralysis should be explained in a different way"

Duane, however, as Dr White has already stated, wrote on this subject only after spending many years studying the functions of convergence and divergence. In a paper by Dr John Wheeler, which Dr White has also mentioned, Dr Wheeler states that "Duane more than anyone else has insisted on the importance of a distinction between the function of convergence and that of internal rotation of the eyeball (adduction, adversion) and of a similar distinction between divergence of the eye and external rotation (abduction, abversion). A patient may be able to perform absolutely normal inward rotation of each eye by looking to the right and to the left and yet may be without the power of normal convergence.

Similarly, a patient may be able to perform outward rotation of each eye in a perfectly normal manner and yet have partial or total paralysis of the divergence power. Too much stress cannot be laid on this point "

The onset of divergence paralysis is usually sudden with the distressing symptom of homonymous diplopia, and it is this symptom which gives the oculist the clue to the diagnosis when the patient states he sees double for distance but not for closeness. One patient of mine gave me the clue when he stated, "Cars coming toward me appear double and as if, were I riding a bicycle, I could go in between them, but my work, which is appraising jewelry, does not bother me." Another patient, an engineer,

had his onset while driving a train from Buffalo to Syracuse

He said, "All of a sudden I saw eight tracks instead of four, but my controls close to me did not bother" He brought his train into Syracuse by closing one eye He retired soon after as he had already reached the age limit.

In these patients of divergence paralysis a convergent squint is apparent, but if their eyes are rotated outward, they will move in a normal manner A light brought toward these patients will fuse at several inches from the eyes Duane calls this "alagle vision by approximation." If the light is withdrawn fusion is maintained until the light is several inches farther away Duane calls this "single vision by recession" Wheeler explains this latter by the patient's ability to relax his convergence. Wheeler further states

"Perhaps the most striking thing brought out

in the subjective examination of cases of divergence paralysis is that as the patient looks to the right or to the left, there is actually less diplopia than in the primary position, so that when the testing light is carried to the right or to the left, the images seem to the patient to approach each other Thus. it is seen that the external recti readily perform their part in the conjugate movements. This is in sharp contrast to what happens when the same test is made in a case of external rectus paralysis. As you all know diplopia is increased as the patient looks to the right if the right external rectus is paralyzed and, similarly, it increases as the patient looks to the left if the left externus is paralyzed. if both externs are paralyzed, diplopsa increases whether the patient looks to the right or to the left from the primary position '

So it is important to remember that divergence paralysis does not mean paralysis of the external recti.

REHABILITATION CENTER FOR ARMY HARD OF HEARING CASES OPENED AT WALTER REED HOSPITAL

The Army's new and ultra modern rehabilitation center for the deafoned and hard of hearing has received 85 patients at the Forest Glen Section since it opened recently, Brig. Gen George C. Beach Jr., commanding general of the Army Medical Center and Walter Reed General Hospital has announced.

Designed as a special unit where the hearing handicapped can have their disability appraised and corrected to the maximum extent through hearing aids, hp reading, and speech correction, the Aural Rehabilitation Center will have sufficient space, equipment, and staff to care for as many as 250 students."

The GI enrolless—officers and enlisted personnel, women as well as men—will indeed, be students rather than patients. For persons ordered to the special Forest Glen facility which is a section of Walter Reed General Hospital, will be those who are finished with treatment and surgery and who now require rehabilitative attention.

Director of the Center is Maj Henry Cogswell Barnaby, an ear specialist who practiced in Glen Cove, Long Island NY, before the war Under him a staff of approximately 50 including 12 instructors in speech reading, six acoustic technicians expert in testing and fitting hearing sids, six tech nicians, five speech correctionists and smaller num bers of specialists in other fields will teach how the device is most efficiently used.

Soundproof testing rooms, where doctors and technical experts will be able to tell precisely what the subject a hearing loss is are on the bottom floor The two upper floors will house offices of the administrative staff, record keeper and Rod Cross unit.

A sound direction unit, including a control and

testing room, makes it possible to determine the exact angle of sound and assists the patient in learn

ing to localize the source of sound.

The unit will have its own earmold laboratory, where dental technicians familiar with the handling and properties of acrylic plastics will make the car-fitting molds into which the hearing aid a receiver is installed. Those molds are custom-made for each wearer, since no two individuals possess car canals that are identical.

Lip or speech, reading will be taught both in individual lessons and in class. A knowledge of its principles and fundamentals confers an added ad vantage upon the hard of hearing person, even if he

is a successful user of a hearing aid

Speech correction exercises will be given those whose enunciation or pronunciation has suffered as a result of hearing loss. Careful examinations and study will precede issuance of a hearing aid types are tested on the patient and the one that gives the best results, and which satisfies the learner most. is the one ultimately selected

Major Barnaby estimates that no more than 20 per cent of the Army's deafness and hard of hearing cases can be attributed to trauma, that is, to blast injury or some other combat-connected cause. The remainder were due to disease, infection aftereffects, or other unspectacular reasons.

Planned as an eight-week program the rehabilita tion course at Forest Glen has as its objective the transformation of every student into an independent, adjusted individual capable of resuming his or her place in society with the least possible handleap economically or socially —Office of the Surgeon General, October 18 1948

POSTGRADUATE MEDICAL EDUCATION

Programs arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this Section of the Journal. The members of the committee are Oliver W H Mitchell, M D, Chairman (428 Greenwood Place, Syracuse), George Baehr, M D, and Charles D Post, M D

Lecture by Dr Charles Connor

THE Broome County Medical Society will attend a lecture on February 11 in the auditorium of the Binghamton City Hospital in Binghamton, at 8 30 PM. Dr Charles A R. Connor, instructor in medicine, New York University, College of Medicine, will lecture on "Rheumatic Fever—Rheumatic Heart Disease"

Postgraduate Instruction for Geneva Academy of Medicine

ARTHRITIS—Acute and Chronic" will be the subject of the lecture to be given by Dr L Maxwell Lockie, professor of therapeutics and associate in medicine, University of Buffalo School of Medicine, on January 16

Dr Harry Gold, associate professor of pharma-

cology, Cornell University Medical College, will speak on "The Management of the Failing Heart," on February 20

The postgraduate instruction will be on Thursday evenings at 8 30 PM in the Seneca Hotel, Geneva, New York.

Series of Lectures for Richmond County

INSTRUCTION for members of the Richmond County Medical Society will be given every Thursday afternoon during January at 3 30 PM in the auditorium of the United States Marine Hospital, Stapleton, Staten Island

pital, Stapleton, Staten Island

"Rheumatic Fever—Rheumatic Heart Disease" is the topic of the first lecture on January 2 Dr Homer F Swift, of the Hospital of the Rockefeller Institute for Medical Research, will speak. On January 9 Dr Hugh Chaplin will discuss "Care and Feeding of Prematures" Dr Chaplin is clinical professor of pediatrics, New York University, College of Medicine On January 16, Dr Nathan Sobel,

who is assistant clinical professor of dermatology and syphilology, New York Post-Graduate Medical School, will speak on "Diagnosis and Treatment of Common Skin Diseases" Dr. Lloyd F. Craver, assistant professor of Clinical Medicine, Cornell University Medical College, will present a lecture entitled "Treatment of Lymphomatous Diseases," on January 23

The final lecture will be held on January 30 when Dr Herman O Mosenthal will discuss "Insulin in the Treatment of Diabetes" Dr Mosenthal is professor of clinical medicine, New York Post-

Graduate Medical School

"DOCTOR JONES" SAYS-

"What is the world coming to?" Some of the older folks, talking about the younger generation and its social activities—what some of 'em call its "law-lessness"—the crime waves and whatnot I don't know how many times I've heard that question And now, on top of all the rest, there's the peace situation, atomic bombs, food shortages, prices, and so on, to worry about But there's one consolation however bad the situation may be, it ain't so bad but what it's been a lot worse

It reminds me of the squib I read twenty-odd years ago One Englishman remarked to another that the *London Times* wasn't what it used to be "No," the other fellow says, "and it never was"

And, you know, it'd ease up considerable on our worrying organs if, once in a while, we'd relax and consider what the world's coming from Go back, for example, a little matter of three hundred years (and, in the history of the world, that ain't long) and look at England, where most of our Pilgrim Fathers hailed from

Among the socially elite, drunkenness and sexual promiscuity were the rule rather than the exception in the cities, folks that went out on the streets at night without a bodyguard were hable to be robbed

or murdered Anyone that lived forty years was old and, if they raised half the babies that were born, they were doing well The rich lived in luxury while the poor starved

An epidemic of plague, in London, carried off 10,000 people in a year and only stopped when there were no more susceptibles for it to work on The best doctors knew less scientific medicine than the average intelligent layman today Their "nurses" not only knew nothing about nursing but plenty of 'em—they had to lock up their valuables when they came in the house

Later, in our own country, human beings were sold as slaves, others "bound out" to servitude about

"Witches" were burned and people persecuted because of their religious views Epidemics ran 'til they burned 'emselves out

Yes, I crab, along with the rest, because I can't send out and get a porterhouse steak when I want it and I may wonder, occasionally, if the rising generation is going to turn out worse'n mine did But what the world's coming to—I'm reasonably sure it can't be half as bad as what it's coming from —Paul B Brooks, MD, in Health News, October 28, 1946

DEPARTMENT OF MEDICAL CARE INSURANCE

CONDUCTED BY GEORGE P FARRELL, DIRECTOR

Medical and Surgical Care, Inc., Unca, N Y

The following is the first in a series of histories of nonprofit voluntary medical care insurance plans operating in New York State

MEDICAL & Surgical Care, Inc., of Utica, N Y., was organized in 1939 by the Oneida County Medical Society with the cooperation of Hospital Plan, Inc. and public spirited citizens. It was the first Plan in New York State to be approved by the Insurance Department. Other County Medical Societies in the operating territory as well as the New York State Medical Society, have endorsed the Plan and cooperated splendidly thus adding speatly to the Plan's successful expansion

The original public offering of the Plan was made in April, 1940 During its six years of operation, the Plan has carefully studied and evaluated its various types of coverages. Certain changes toward further improvements are now receiving care-

ful consideration

Officers and Directors

The officers of the Plan who have served since its inception are president, Dr F M Miller Jr., first vice-president, Dr H. N Squier, accord vice-president, Dr J F Kelley, treasurer, Charles W Hall and secretary, Michael Yust. Besides these officers, the Board of Directors is composed of Drs. M J A'Hearn B F Golly, William Hale, Robert C. Hall, Fred G Jones, Hyzer W Jones, J B Lawler, Dan Meilen, F M Miller Sr., Harold L. Pender and Robert Warner, and Messre. Gilbert Butler, F Ramsay Devereux, J David Hogue, Leland D McCormac, Walter F Roberts, and Al bert R. Woodard, and Harold C Stephenson its managing Director The officers of the Plan who have served since its managing Director

Enrollment

Medical & Surgical Care, Inc. is offered to subscribers of the Blue Cross Hospital Plan Inc. to those enrolled in "Groups" and to thousands enrolled as 'Individuals.'

The enrollment as of September 30, 1946 totaled

Enrollment progress of Surgical Plans offered in conjunction with Hospital Plans may only be judged by the ratio or percentage of acceptance of one to the other Forty-eight per cent of Hospital Plan, Inc. members have added this valuable additional coverago,

Territory Covered

The operating territory of the Plan includes 30 per cent of the area of the State of New York con taining only 41/2 per cent of the State's population. These figures furnish an idea of the vast amount of agricultural enrollment involved.

The plan covers all or part of the following counties Chenango Delaware, Essex, Franklin Hamil ton Herkimer, Lewis, Madison Montgomery, Oneida, Oswego, Otsego and St. Lawrence.

Participating Physicians

Practically all physicians living in the area covered are 'participating' and their helpful cooperation

has made the Plan successful. The Participating Physician Fee is \$1 00 Full subscriber benefit foca are paid to any licensed physician
All elected officers and directors serve without

remuneration and the nonprofit Plan is tax exempt.

Operation Simplicity

In 1941 physicians were invited to mail their patients' bills to the Corporation's office where the amount of credit would be stamped and the bill forwarded to patient showing balance if any that is due the physician This procedure is not a must, but is used frequently In all cases the physician determines his own fee against which the printed Schedule of Benefits applies

Financial Position

As of September 30, 1946 assets of the Corpora-tion totaled \$300 030 Special reserves, including \$25 000 for unreported claims totaled \$26 217 Reserve for maternity care was \$50,000 Statutory and General Reserves equal \$135,293 making a total reserve account of \$211 510

Seven hundred thirty-five thousand two hundred and seventy six dollars have been paid or accrued

for surgical and medical claims.

The Plan has paid out 100 per cent the amounts originally agreed upon for the fee schedule and no money in any way has been charged off or is with held for possible future payments.

Surgical and Special Benefits

The medium priced Plan offers subscribers and dependents a credit toward the cost of care while in a hospital for anesthesia, \$10, x-ray, \$10 special laboratory \$7, metabolism, \$5 cardiogram \$5

Also for subscriber and dependents, the following is offered in office home or hospital or any other place maternity, \$50, cosarean section \$75, ectopic pregnancy, \$75, miscarriage, \$30, D&C,

Also available to members (not confined to a hospital) is surgery in accordance with printed schedule up to \$225 for subscriber Dependents are covered to \$125 at one-half the surgical schedule amount allowed subscriber

Special Benefits

One hundred and twenty-five business firms are paying for the cost of their employees enrollment in this and the cooperating Hospital Plan When 75 per cent or more of all employees in a firm are en-rolled, providing there is a minimum of 50 all wait-ing periods for maternity and pre-existing conditions are walved for both employees and enrolled dependents. Age limits are waived for employees. Dependents age limits are sixty days to sixty-six years for enrollment.

Low Cost Plan

A much lower cost Plan is also available which

carries a fee schedule approximately 25 per cent less than the Plan described

Medical Call Rider

Those subscribing to either surgical plan may elect to add, at a small additional cost, a Rider which provides a credit of \$2 00 toward the cost of each medical call made in a hospital Also included are three additional credits toward cost of calls made within ten days of hospital discharge at \$3 00 in the

home or \$2 00 m office The same amount of credit is allowed to both subscriber and dependent Approximately 20 per cent of those enrolled for Surgical and Special Benefits have added the Medical Call Rider

> Prepared and Submitted by Harold C Stephenson, Managing Director Medical and Surgical Care, Inc.

'THROW BACK YOUR SHOULDERS" POOR ADVICE FOR GOOD POSTURE

Good posture is important not only for the sake of appearance but also for comfort, mechanical efficiency and physiologic functioning, according to Beckett Howorth, M D, of New York.

Writing in the August 24 issue of the Journal of

the American Medical Association, Dr Howorth recognizes that certain things tend to prevent good posture, for example, "fatigue, lack of sleep, malnutrition or mental depression causes drooping, and the pelvis shifts and tilts forward, the abdomen profudes and the chest flattens. The corpulent abdomen throws the body off balance and the upper part of the trunk and the head are thrown back to maintain balance, resulting in a swayback posture and back strain. The tall person may stoop to reduce his height to that of his neighbors or to fit his clothes, doorways, stairs, furniture and Pullman Clothes which are too small or too tight also tend to cause imbalanced posture High heels tend to throw the weight forward, this effect must be counterbalanced by swaying the back or flexing the knees and hips, either of these compensations is apt to be uncomfortable and fatiguing Certain occupations, such as desk work, favor poor posture, especially when long hours are spent in one position and the desk and chair are not satisfactory

According to the author, the following harmful effects will result from continuous or habitual bad

posture

"Bad posture overstretches some of the muscles and ligaments, relaxes others and allows the stronger or shortened ones to contract further, increasing the bad effect, eg, the calf muscles shorten when high heels are worn. Poor posture reduces the circulation locally and generally, perhaps serving a temporarily useful purpose during relaxation but, if continued, diminishing the metabolism and efficiency of the cells and tissues, inducing sluggishness and drowsi-Breathing is shallow, with reduced oxygen ble for the tissues The abdominal organs available for the tissues sag (ptosis) and perform poorly, often with discomfort, resulting in constipation and headache physical and mental attitude is one of depression and sluggishness Backache, leg and foot pain and fatigue are frequent symptoms of bad posture, and consequently stooping, heavy work and participa-tion in sports are frequently avoided Lastly, clothes fit poorly when the posture is bad, and the general appearance of the individual is distasteful to others

A review of three standard positions—lying, sitting, and standing—follows, with Dr Howorth's suggestions for improvement of these static postures "Lying may be considered the fundamental hu-

man posture, since it usually occupies more hours of the day, and the position is more easily assumed than A sagging bed allows the muscles any other and ligaments of the upper part of the body to relax but stretches those on the opposite side and tends to distort the abdominal organs and chest All innerspring mattresses and most bed springs have an undesirable amount of sag, especially with a heavy occupant or two, and many of them bound like a rock-The best mattress ing horse when one moves from the standpoint of posture is one of felted cotton, hair or both, or of sponge rubber thick enough for comfort

"The sitting posture is of next importance to most people because of the large number of hours many of them spend sitting and because of the bad effects of poor sitting posture The basic sitting position should be with the trunk and head crect and cen-tered over the pelvis or tilted slightly forward, with a medium or slight lumbar arch and with the hips

and knees flexed at a right angle

"The standing position—this basic position has rtain ideal characteristics. The body should be certain ideal characteristics vertical and essentially straight when seen from the side as well as from the back. The vertical line should pass through the ear, shoulder, center of the hip and ankle when seen from the side, physiologic thoracic and lumbar spinal curves should be slight and the pelvis erect rather than tilted forward feet and knees should be directed forward, and the arches should not sag
The chest should be erect but not fully expanded or tense, the abdomen flat and relaxed neither sagging nor retracted The and relaxed, neither sagging nor retracted common admonition 'throw back your shoulders' is a poor and ineffective approach to good posture 'Suck in your stomach and throw out your chest' usually results in a tense, rigid, tiring posture which may be as bad as the posture it is intended to cor-The shoulders should rest comfortably on the chest rather than be held rigidly back with the arms turned outward The position should be maintained with the spine rather than the shoulders The body should achieve its full height in this position, with the head and chin level, not tilted back. There should be a feeling of tallness, with the top of the head pulling away from the soles of the feet

DEPARTMENT OF WORKMEN'S COMPENSATION

CONDUCTED BY DAVID J KALISKI, M.D. DIRECTOR

Important Announcement

A N important change in the Workmen's Com-pensation Law with respect to domestic workers became effective on January 1 1947 Chapter 311, Laws of 1946 (Workmen s Compensa tion Law), provides that domestic workers, other than those employed on farms, employed by the same employer for a minimum of forty-eight hours a week in a city or village of not less than 40 000 population come within the mandatory provisions of the Law and therefore the employer of any such domestic worker or workers must provide workmen's compensation insurance covering them

Although the new law specifically provides that the fallure of any employer to obtain such insurance shall not be a misdemeanor, as in the case of other employers, nevertheless any employer who is subject to the new law becomes personally liable for the payment of compensation benefits on account of the injury of domestic worker in case said employer is not insured Probably the fact that no insurance was carried whore required under the new law would deprive the employer of any defense in a civil

Attention is called to this new law, for according to the 1940 Casus, it would affect the following 18 cities in the State Albany, Bunghamton Buffalo Elmira, Jamestown, Mount Vernon, New Rochelte ow York City Ningara Falls, Poughkeepsie, Rochester Romm, Schencetady Syracuse, Troy Utica, White Plains, and Yonkers.

THE LABORATORY IN MEDICINE AND PUBLIC HEALTH

The public health laborators and the diagnostic clinical laboratory both serve important but distinct functions in the prevention and management of disease.

The organization and scope of the public health laboratories of California have been considered in this issue of California Medicine. The organization is properly decentralized. Thus the State laboratory does not usurp the duties of the city or county or ganization but aids them in their development and in the maintenance of high standards. It provides the essential services where they cannot be provided locally

The laboratory services performed by the system of county and state public health labora tories are concerned properly with matters of public health importance such as adequate control of the purity of water and food, in control of epidemic discase and other factors involving environmental sam Thus studies conducted by the public health laboratories revealed a dangerous degree of sewage pollution to exist on some of the popular ocean beaches. This led inevitably to quarantine of the beaches pending application of the corrective measures of sanitary engineering. Joint studies supported by public health laboratories, industry and Hooper Foundation of the University of Califorms have done much to develop and maintain the high standards of canning in our state. The re-cently developed Virus Research Laborator, supported in part by the Rockefeller Foundation and under the jurisdiction of the State Health Department contributes importantly in safe-guarding public health. As a policy it would seem desirable to have such research activities closely linked to Medical schools and schools of Public Health

The public health laboratories have a wide field of important activities and need not, indeed, should not,

encroach upon the field of the hospital or diagnostic laboratories. The diagnostic laboratory is an important element in the organization contributing to adequate care of the patient. Its services should be readily available to the physician and it should be under the direction of a woll-trained pathologist. The pathologist must see that a high standard of Inboratory service is available and should act as a consultant with the physician There has in fact been a shortage of trained pathologists but it appears that this is being overcome and an increasing number of able young men are choosing pathology as a specialty

The direct consideration of dagnostic problems by the pathologist and the attending physician has a great advantage over the impersonal and often delayed report coming out of a ro-mote laboratory Development of high-grade lab-oratory services in conjunction with adequate hospital facilities throughout the state constitutes one of our more important health needs. The young physician needs an adequate work shop Ho is not content with "guestwork" medicine. Our needs should be clarified by the hospital survey currently being conducted by the State Health Department. When the needs are defined, a concerted effort should be made to meet them,

The research laboratories that ultimately contribute to medicine represent nearly all branches of science. More direct in their contribution are the investigations emanating from the laboratories of the basic medical sciences. New technics of im portance will continue to filter down from "pure' actence to medical science and into the laboratories where they are applied in the prevention and care of disease. The role of the laboratory in medicine and public health will inevitably be one of increasing im portance.-Editornal California Medicine, August

MEDICAL NEWS

Dr George Baehr Re-elected President of the New York Academy of Medicine

AT THE stated meeting of the New York Academy of Medicine, held on December 5, Dr George Baehr, who has served as president of the Academy since January 3, 1946, was re-elected president for a term of two years

dent for a term of two years

In addition, the following officers were elected vice-president, Dr Waldo B Farnum, trustees, Dr Bradley L Coley and Dr Seth M Milliken,

members of the Committee on Library, Dr Arnold Knapp, Dr Robert L Levy, and Dr Morris K. Smith, members of the Committee on Admission, Dr Ralph Colp, Dr Dabney Moon-Adams, Dr Ralph L Barrett, and Dr Frederick C Hunt, and Dr Charles G Williamson, member of the Committee on Admission to fill the unexpired term of Dr Arthur C DeGraff

Diabetes Association to Hold Open Meeting

THE New York Diabetes Association, Inc, 2 East 103rd Street, New York 29, will hold an open meeting on Saturday, January 11, 1947, at 8 30 P M in the Blumenthal Auditorium, Mount Sinai Hospital New York City

The program, with Dr Herman O Mosenthal, chairman, Committee on Internal Medicine, presiding, will consist of a lecture on "Recent Studies on the Function of the Adrenal Cortex" by Dr C N H Long, Sterling professor of physiologic chemstry, Yale University, with discussions by Dr

Robert F Loeb, Lambert professor of medicine, Columbia University, College of Physicians and Surgeons, Dr Louis J Soffer, associate attending physician, Mount Sinai Hospital, and Dr I Arthur Mirsky, director of the May Institute for Medical Research and associate professor of experimental medicine, University of Cincinnati

Members of the Council of the American Diabetes Association will be the guests of the New York Diabetes Association at this meeting. All physicians and medical students are cordially invited to attend.

British Doctor Honored for War Work on Tropical Disease Control

DR NEIL HAMILTON FAIRLEY, professor of tropical medicine of the London School of Hygiene and Tropical Medicine, was awarded the Richard Pearson Strong Medal on November 26, as "a soldier who has conquered disease, relieved the suffering, and saved the lives of innumerable persons in many lands" at a special dinner meeting of the American Foundation for Tropical Medicine at the University Club, New York During the war, Dr Fairley was chairman of the combined Advisory

Committee on Tropical Medicine to General Mac-Arthur

The presentation was made by Col Richard Pearson Strong, United States Medical Corps (retired), for whom the medal and award were named, and who received it first in February, 1944

The award, together with a \$500 cash honorarium, was established by the Foundation through a gift by the Winthrop Chemical Company, Inc

Personalities

Dr Ralph E Swope, of New York City, who served from October, 1942, to May, 1946, in the Medical Corps of the Army, returned with the rank of major and has resumed his practice in internal medicine. He is associated with Dr Charles F Tenney, at 47 East 66th Street, New York City He has also resumed his position as chief of the adult cardiac clinic and is teaching cardiology at the New York Medical College

Dr Krischer is a former Field Artillery battalion surgeon and instructor at the Army's Medical Field Service School at Carlisle Barracks, Pennsylvania.

Before the war Dr Kracher was a member of the Kings County Medical Society and practiced in Brooklyn He was commissioned in April, 1941, and after service at the Carlisle School, was assigned to the 34th Infantry Division. He saw action in the Tunisia and Naples-Foggie campaigns with the 151st Field Artiller

After receiving his medical degree from the University of Glasgow, Scotland, Dr Krischer interned in New York City He was formerly on the staff of

Gouverneur Hospital there.

Dr John J Hogan, of Syracuse, is reopening his office at 1814 W Genesee Street, following three years service in the Army Medical Corps.

He attended the medical field service school at Carlisle Barracks, Pennsylvania, and took a threecampies harraces, Fernsylvains, and cook a Circo-month course in internal medicine at Mayo Clime, Rochester Minnesota. Later he was ward officer at Lovoil General Hospital, Fort Devens Mass-achusotts, and was at the station hospital, Camp Campbell, Kentucky He participated in the New Gunnea and Philippine campaigns and was awarded the bronze star for each of these operations

Dr Hogan received his medical degree at Syracuse in 1934. He is an instructor in medicine at the College of Medicine and associate physician at Memorial Hospital. He recently completed postgraduate training at Harvard and Peter Bent Brig

ham Hospital, Boston. *

Dr Martin B Tinker and Dr Martin B Tinker Jr have reopened offices in Ithaca and resumed the practice of surgery

Development of a full-scale health program for Broome County has been endorsed by the Broome County Medical Society

This was announced November 15 by Dr Ralph M Vincent, Binghamton District State health officer who said he discussed the proposed program for Broome County recently with society members.

Development of an adequate health program for

the county was approved by the Society, 'Dr Vin cent said.

The State health official said he hoped to talk with county officials about the possibility of a \$50 000 appropriation to help defray the expense of establishing more adequate health services for the county On this basis the state would contribute \$100,225

to provide an overall total of \$150,450 with which to institute such a program he added.

Dr Vincent said the proposed program would not

' disturb the county's present orthopedic or physi

cally handicapped program, nor its school nursing program "

An address by Dr I J Rosefsky, of Binghamton, featured the meeting of the Cerebral Palsy Association of Southern New York on November 15 in Phelps Hall, Binghamton City Hospital *

County News

Chautauqua County

Appointment of Dr George Rubenstein, of Dunkirk, as U S Veterans Administration authorizing physician for the Dunkirk area was announced on November 6, by C W Hourt, contact representa-tive in charge of the V A office Mr Hourt said the appointment was made by Dr Frank E Brundage, V A medical officer of the Buffalo Regional A medical officer of the Buffalo Regional Office

Dunkirk area veterans may now apply at the east wing of School 7 for authorization by Dr Rubenstem for treatment of their service-connected disabilities, Mr Hourt explained They may receive this treatment from their own physicians, he added

Veterans Administration authorizing physicians in the Buffalo Region now are at Dunkirl, Buffalo, Syracuse, Rochester, Ogdensburg, Hornell, Olean, Lackawanna, and Binghamton *

Chenango County

"The Physical Examination of the Child Importance in Diagnosis" was the subject discussed by Dr Marjorie F Murray, at a meeting of the Chenango County Medical Society, on December 10 Dr Murray is pediatrician-in-chief at the Mary Imogene Bassett Hospital, Cooperstown.

Dutchess County

The December meeting of the Dutchess County Medical Society was held at the Pavilion at Hudson River State Hospital on Wednesday evening, December 11, 1946, at 8 30 P M

Dr Clay Ray Murray, Dr Sawnie Gaston, and Dr Barbara Stimson, of Columbia Presbyterian Medical Center, discussed "Fracture Problems"

Recommendations made by the Dutchess County Medical Society that the Board of Supervisors give consideration to formation of a county health district and a county laboratory, recently were referred to the board's Health Committee for study

Supervisor Supple, board chairman, referred the recommendations to the Health Committee, headed by Supervisor Jones, after the Medical Society's letter had been read to the entire board cal Society passed the resolutions at a recent meeting and directed that the organization's action be made known to the Board of Supervisors

Dr John F Rogers was elected president, on November 4, of the newly formed Physician Veterans of Dutchess County, formed by physicians who served in World War II in order to "better serve the interests of the physician veterans of the county as related to the medical profession "

Other officers elected at the organization meeting, held at Vassar Hospital, were Dr Neil C Stone, first vice-president, Dr A A Leonidoff, second vice-president and chairman of the executive committee, and Dr Harold C Rosenthal, secretary-

treasurer

The executive committee is composed of the elected officers plus Dr John Turiga, Beacon, Dr E Alan Larkin, Amenia, Dr Crawford McLane, Poughkeepsie, and Dr Frederick Zipser, Red Hook

Two types of membership have been determined for the new organization. Active memberships shall be limited to physician veterans of the county of World War II "who served actively and honorably in the armed forces of the US and/or its allies, during the emergency." Associate memberships shall be limited to veterans "who served actively and honorably as physicians in the armed forces of the US and/or its allies in World War I and who are now residents in Dutchess County "*

Erie County

There probably are unsuspected murderers at large and persons being punished for "crimes" that were never committed, because of 'lack of a competent mechanism in the average American community to investigate adequately the cause of many deaths," Dr Alan R. Moritz, professor of forensic medicine at Harvard University, indicated on November 6

Skilled medical men with knowledge of pathology are needed for official postmortem investigations in the interests of public safety, Dr Moritz told 90 members and guests of the Buffalo Academy of Medicine, in the Museum of Science The meeting was sponsored by the Academy's Pathology Section

"One out of every five deaths in the nation is due either to unknown causes or to violence of some kind," he said
"Public safety demands a competent mechanism

to examine this 20 per cent for cause of death for these reasons so murder may not go unsuspected or undetected, so the innocent may not suffer for 'crimes' which never occurred, so preventible or controllable hazards to public health may be recognized "*

More clinics and workers are needed to treat spastic paralytics throughout the State, physicians and hospital authorities told the joint legislative committee studying the problem of cerebral palsy at a public hearing, on November 7, at the County Hall, in Buffalo

Dr Richard A Downey, of Buffalo, said that, as far as he knew, the inpatient department at Children's Hospital was the only one in the State with

Dr Mitchell I Rubin, presenting a statement from the Eric County Medical Society's General Palsy Committee, said the State should offer aid to those unable to pay the cost of medical care statement recommended an educational program regarding the needs of victims for medical and allied groups, a wider distribution in the State of cerebral palsy centers, a research program, and making any program adopted a cooperative effort involving all specialists dealing with the problem

The Medical Society of the County of Erie will take to the air waves again in January according to an announcement by Dr John D Naples chairman of the Society's Special Committee on Public Rela tions, Education and Radio Programs

A long-range series of weekly educational broad casta—the second undertaken by the Society—will be conducted over Station WEBR, whose generality is hereby acknowledged by the Radio and Public Relations Committee Dr Porter A Steele Society President, and the Society as a body

It appeared likely that the new program of broad casts would depart from the familiar round table technic that characterized the well received initial series conducted by the Society in the summer of

1945

Dr Naples announced that he will convene a meet ing of his committee soon to consider the type of programs to be presented topics to be discussed, and act upon other phases of the project The commit-tee commits of the following Dr Naples chairman The commit-Dr Harry C Guess cochairman and Dr Leslie A Benson The close cooperation of all specialty groups will be enlisted by the committee

Jefferson County

Dr Wendell D George, of Watertown, for the past year vice-president of the Jefferson County Medical Society was elected president of the Society when the organization held its annual meeting at the Black River Valley Club November 14

The new president succeeds Dr. Sumner E. Doug las, of Adams, whose term expired Dr Douglas was elected a member of the board of censors in accordance with the precedent of electing the retiring president as a censor He was also chosen delegate to the meeting of the Fifth District Branch of the Mod ital Society to be held next October, Dr Terry S Montague, city health officer, being chosen alternate Dr L Otls Fox, of Brownville was elected vice-

president to succeed Dr George and will be in line for the presidency next year Dr Charles A Prud hon was re-elected secretary, and Dr Lawrence L.

Henderson was re-elected treasurer

Four members of the board of censors were re elected Dr Harlow G Farmer and Dr S E. Simpson Watertown, Dr Leon L Samson, Alexan-dria Bay and Dr E E. Babcock Adams Center

who, with Dr Douglas, will compose the board.
Dr George acknowledged at the meeting the fact that the membership of Dr George B Ewing, now of Lafargeville, has been transferred to the Jefferson County Medical Society from the Delaware County Medical Society *

"Diabetes Mellitus—Its Modern Interpretation and Treatment" was discussed by Dr. George E. Anderson at the December meeting of the Society held at the Black River Valley Club Dr Ander son is clinical professor of medicine, Long Island College of Medicme, Brooklyn

Kings County

The Brooklyn Cancer Committee announced recently that a meeting summarising the most recent information on cancer research was held at the Brooklyn Academy of Music, on November 7

Dr Michael R. Deddish, of Memorial Hospital, Manhattan, formerly with the United States Naval Hospital, Medical and Dental Schools at Bethesda. Maryland, spoke His subject was "Advancing Fronts in Cancer Research."

With this meeting the Cancer Committee launched its new policy of holding each year one or more programs designed to bring the latest knowledge on cancer treatment, research and allied topics to professional workers, Dr S Potter Bartley, chairman

of the committee said

The program for the meeting was planned by Dr Earl A. Martin, chairman of the biology department of Brooklyn College, and a committee of teachers

representing the Office of Education

A technical film basic to the research program was There was a discussion period during which the audience was able to ask questions concerning the treatment, diagnosis, and nature of cancer

Madison County

Dr Richard Cuthbert of Canastota, was elected president of the Madison County Medical Society at the 140th annual dinner meeting of the Society at Hotel Oneida on November 7 He succeeds Dr Felix Ottaviano

Other officers named were vice-president, Dr Edward Huxson, Oneida, secretary Dr Lee S Preston, Oneida re-elected, treasurer, Dr George Pixley Canastota.*

Monroe County

Dr Arthur C. DeGraff professor of therapeutics at the New York University, College of Medicine, delivered the principal lecture at the meeting of the Monroe County Medical Society's postgraduate

Dr DeGraff spoke on "Evaluation of Methods to Determine How Much a Cardiac Must Limit

His Activities.

Nassau County

The Nassau County Cancer Committee will merge its efforts with those of the county government in plans for the expansion of Mendowbrook Hospital Dr Arthur C Martin chairman of the committee, revealed November 14 at the Ninth Annual Cancer Institute held in the Garden City Hotel

"There all types of cancer cases will find a haven where the best scientific knowledge can be brought Martin told more than 300 persons who at-

tended the luncheon and forum session

The Cancer Committee conducted a drive last spring for the purpose of raising funds to build a home for cancer patients The committee has now decided, the chairman stated that a joint effort with the county will "provide in a much more extensive

the county win provide in a much more extensive way for that need.

'The Cancer Committee, through its years of work at the grass roots of the problem, can be of tremendous advisory aid to the hespital's board of managers. The funds given to us will be used to further provisions for cancer patients at Meadow brook. They will be expended for no purpose for which they were not intended.

The routine work of the group chiefly that of educating the public, will go on Martin asserted

The four speakers at the afternoon panel discussion joined together in emphasizing the paramount importance of early diagnosis and treatment of cancer They were Dr Joseph H Farrow con sultant oncologist at Vassar College, Dr John A.

Kelly, senior attending obstetrician and gynecologist, Misericordia Hospital, New York, Dr Gordon P McNeer, adjunct consultant, gastrointestinal diseases, Meadowbrook Hospital, and Dr H R Tollefsen, adjunct consultant, intraoral neoplasms, Meadowbrook Hospital *

New York County

Awards of the four Lions Club scholarships for advanced study of eye diseases at New York University, College of Medicine, were announced in November by Dr Currier McEwen, dean of the College The doctors, selected by the University's depart-

The doctors, selected by the University's department of ophthalmology for the \$500 awards are Edward Danforth, Bainbridge, New York, Charles Goldsmith, Catasauqua, Pennsylvania, Jonathan L Harris, Elberon, New Jersey, and Hugh McGhee, Jeffersonville, New York All are postgraduate students at the College of Medicine and are specializing in ophthalmology

The Eye Conservation Fund, Inc, of the New York Lions Club initiated the scholarship plan last spring with a gift of \$2,000 to the College Ernest R Fryxell, chairman of the Eye Conservation Fund, stated that the Lions Club will provide four scholarships annually for advanced study of eye diseases at

New York University

Dr Howard Fox spoke on "Dermatologic Features of Syphilis," on December 28 at the New York City Department of Health, at the concluding meeting in the current Venereal Disease seminar for practicing physicians A lantern slide demonstration accompanied the talk

Dr Fox is editor of the Archives of Dermatology and Syphilology and professor emeritus of dermatology and syphilology at the New York University,

College of Medicine

Oneida County

An increase in fees charged by physicians, brought about by "the long-standing upward spiral of all basic commodity costs," was announced November 15 by the Medical Society of the County of Oneida

The action, taken at a recent meeting, raises the schedule for office calls to \$3 and house calls to \$4. Previously, most physicians charged \$2 and \$3 respectively, for these calls

The Society members also decided to add \$1 per mile, one way, to the cost for out-of-town calls *

Fifty physicians who specialize in nervous and mental disorders held a dinner meeting in November in Utica State Hospital, at the call of the newly organized Mohawk Valley Neuropsychiatric Society, and with Dr Arthur W Pense, acting director there, as host

The physicians were from the area between and including Albany and Syracuse The principal speaker was Dr Lother Kalinowsky, New York, one of the first doctors in this country to use the electroshock therapy

Dr James N Palmer, Utica State Hospital, spoke on dementia praecox and Dr Richard H Hutchings, retired superintendent of the hospital,

discussed the subject

Neurological diagnostics were analyzed by Dr Oswald J McKendree, Utica State, and discussed by Dr Robert H Stevens, Utica neurosurgeon *

Onondaga County

"Rehabilitation of the Handicapped" was the topic of a symposium on November 22 at the College of Medicine, Syracuse University, sponsored by Central New York Chapter, American Physiotherapy Association

Leader of the discussion was Dr William M Cruikshank, director of special education at Syracuse University Dr Cruikshank has had much experience in the field, including service as clinical psychologist with the 231st General Hospital during the war *

Orange County

Headache was the topic of discussion by Dr Harold G Wolff, associate professor of medicine and associate professor of psychiatry, Cornell University Medical College, at a meeting Goshen Court House sponsored by the Orange County Medical Society on November 12

The postgraduate instruction was arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New

York.

Steuben County

The annual meeting of the Steuben County Medical Society was held at Bath, New York, on November 14.

The following officers were elected for the year 1947 president, Dr L A Thomas, vice-president, Dr V S Higby, secretary-treasurer, Dr R. J Shafer, delegate, Dr W J Tracey, and censor, Dr A J Karl

MEDICINE—THEN AND NOW

It was "political medicine" back in 1663

The magazine, The Medical Way, reports that the first American degree of doctor of medicine was conferred by the General Court of Rhode Island Capt John Cranston in 1663 was licensed by the court to practice "chirurgerie" and to administer "physick"

Yale gave the honorary degree of doctor of medicine in 1720 It was conferred on one Daniel Tucker who had been a liberal donor to the university Some sharp tongues translated the M D into "Mul-

tum donavit"

A strangely modern beginning for the highly respected profession of medicine, its current critics will say However, the University of Pennsylvania, then the College of Philadelphia, retrieved the honor of the young profession in 1768 and put it on the right track. In that year the university conferred the degree of bachelor of medicine according to the custom prevailing in England.

The idea was that the bachelors were supposed to return to college and get their doctorates. So few of them did that the college discontinued giving the bachelor's degree in 1789

By 1771 four graduates of the class of '68 had received M D degrees The four were Jonathan Elmer, Jonathan Potts, James Tilton, and Nicholas Way (The last-named a relative of the C W Way who edits the magazine which printed the story?)

The first full medical degrees, the magazine relates, were granted in 1770 by Kings College, predecessor of the Columbia University, College of Physicians and Surgeons—It took only one year beyond college graduation to get the degree in those days Robert Tucker got his bachelor's degree at Kings in 1769 and a year later was granted the doctorate to become the American Colonies' first home-grown M D—Lake County Medical News, September, 1946

HOSPITAL NEWS

Three Veterans Hospitals to Be Built in New York State

PRELIMINARY plans have been approved to build three veterans, hospitals in New York State, one of thom in New York City the War Department announced recently

Incorporating developments in hospital planning made by the Army during the war the 1 000-bed hospitals will be sixteen stories high in order to provide sunny rooms and pleasant there in the tients

The plans are the first to be approved unfor the Veterans Administrations 2000,000,000 pround of building soventy-six hospitals and transformation additions in the United Exter. The York Hospital will be at Fort Hamilton, Exception and the other two now approved are to be at America and Buffalo

Erythrobiastosis Fetalis Clinic at Jewish Memorial Hospital

THE Jewish Memorial Hospital has established a clinic for the study and treatment of erythroblastosis fetalia.

The clinic will be under the direction of Dr Harry Wallerstein, hematologist to the Hospital in collaboration with the following committee Dr Milton J Goodifiend attending obstetrician, Dr Michael Schuman attending pediatrician Dr Alfred Angrist, director of laboratories, and Dr Philip Levine, consulting serologist.

The clinic solicits specimens for study from enter with implications of erythroblastoris feate. In suitable cases mothers will be accepted for admision to the pronatal clinic and/or delivery Enlive born outside this institution in whom the surplace of crythroblastosis exists will also be accepted for

For further information communicate with the Superintendent of the Hospital Broadway and 196th St. (Telephone Lorraine 7 = 3000.)

Newsy Notes

Veterans Administration plans call for the opening of the former U.S. Public Health Service Hospital at Sheepshead Bay as a veterans' hospital by January 1, it was announced recently by David P Page, Deputy Veterans Administrator for New York.

According to plans, 400 veterans will be hospitalized at Sheepshead including 200 patients now being treated at the Bronx Veterans Hospital

A cadre of ten key medical and administrative personnel for the hospital is now being selected and

418 persons will be required to staff the hospital Chief of the Medical Service at Sheepahead Bay will be Dr James E. Boyd, of Baldwin, formerly a commanding officer of army hospitals in the ETO.

Rockaway Beach Hospital in Long Island, expects work to be started soon on new additions to the building, which will place it in condition to give better local hospital service until a new building can be erected

The principal addition will be a new floor on the Soldiers and Sailors Memorial Wing, which was erected following World War I The new floor will erected following World War I permit greatly needed enlargement of the hospital's maternity department and also a new operating

room layout

Another addition is being planned to the older part of the building. This will provide additional laboratory space, a new doctors' library and some enlargement of the hospital's administrative department *

The \$2,750,00 building fund goal for the new Beekman-Downtown Hospital, in New York City, has been oversubscribed by \$150,000, it was announced recently by Elisha Walker, chairman of the hospital board, and Howard S Cullman, president. In an interim report they disclosed that the money has been invested in short-term government bonds.

The report also stated that despite limited space in the present hospital building, a Health Review Clime has been set up to provide pre-employment examinations and periodic checkups for employees of business houses in downtown Manhattan *

Dr Nathan Rabison, twenty-five, a young intern at Unity Hospital, Brooklyn, who was killed July 29 when the ambulance in which he rode was overturned in a collision on Rockaway Avenue, was honored posthumously at a meeting of the staff in the hospital, St John's Place and Buffalo Avenue

Dr George I Miller, surgeon-in-chief, presided, and Dr Sidney Natelson, in behalf of the interns and colleages of Dr Rabison, presented to the hospital a plaque in memory of the deceased It was accepted for the hospital by Municipal Court Justice Jacob S Strahl

This was followed by the presentation of a certificate to the intern's mother Dr Harry Apfel, president of the medical board, made the presenta-

Rabbi Morris S Granchrow, chaplain of the hospital for the past fifteen years, blessed the plaque and pronounced the invocation and benediction

At The Helm

Appointment of Dr Ralph Horton, of Oneonta, who was cured of incipient tuberculosis in 1930, as general director of Tuberculosis Hospitals, State Health Department, has been announced by Gover-

Dr Horton, now director of the Homer Folks State Tuberculosis Hospital at Oneonta, will be responsible for inspection and supervision of all county and city hospitals which will take part in the state-wide program to eliminate tuberculosis in the State within twenty years *

Dr John R. Ross, senior director of the Hudson River State Hospital and former superintendent of the Harley Valley State Hospital, retired on November 30 as director of the Hospital and from the service of the State Mental Hygiene Department

Dr Ross completed thirty-seven years of service with the State Department of Mental Hygiene in November In point of service he was the oldest director in the State *

Dr Phillip Brown has been appointed full-time radiologist at the North Country Community Hospital as of October 1 Dr Brown is a graduate of the Columbia University College of Physicians and Surgeons, New York City, and is certified by the American Board of Radiology Prior to his enlistment in the US Navy as Lieutenant (1 g) MC(S)-USNR, he served as resident physician in radiology at the Presbyterian Hospital *

Dr Mendel Jacobi, assistant medical examiner for Staten Island, has been named consulting physi-cian at St Vincent's Hospital

Dr Henry I Fineberg was recently appointed medical superintendent of Queens General and Triboro hospitals Dr Fineberg succeeds Dr Marcus D Kogel, who was promoted to general medical superintendent of all New York City hospitals

Dr L Howard Moss, of Richmond Hill, Jamaica, was the guest of honor October 16 at a testimonial dinner given by the staff of Jamaica Hospital in the Garden City Hotel

The affair paid recognition to Dr Moss's forty-three years of continuous service to Jamaica Hospital, in which he was chief of the surgical staff until

his retirement last year

Dr Moss has been succeeded as surgical director of the hospital by Dr Joseph D Hallinan, also of

Richmond Hill

A former president of the Queens Medical Society, Dr Moss has been a physician in the borough of Jamaica for a year longer than his career as a Jamaica Hospital staff member He started practicing in Richmond Hill in 1902 after graduating from Columbia University, College of Physicians and Surgeons *

Dr V S LeQuire, of Rochester, has succeeded Dr A C Aufderheide in intern service at the Geneva General Hospital He began his new duties October 1

Dr Arnold A Karan, superintendent of Bronx Hospital and Dispensary, has been appointed a member of the hospital advisory committee of Associated Hospital Service—New York's Blue Cross

Improvements

Recently installed new equipment at the Soldiers and Sailors Hospital in Penn Yan was inspected by the board of directors following a meeting of the Board at the Hospital In the x-ray room they found a complete new x-ray machine of the most modern type, which will greatly advance the work in that department This machine has all the latest improvements and precautionary devices

The old x-ray machine has been set up on the ground floor where it is being used for therapeutic work. This has already been started in the hos-

pıtal

A new boiler and stoker has been installed and is now in use, which will increase the efficiency of the heating system and eliminate some inconveniences found in the old heating system. The boiler which was removed has been in service since the hospital was erected more than twenty years ago *

The first new ambulance on the Rockaway Peninsula since the war has been presented to the Rockaway Beach Hospital by the Ladies' Society of the hospital The presentation was made by Mrs Harry Umans, president of the Ladies' Society, to William F Brunner, president of the Hospital *

Three hospitals, the House of the Good Samaritan and Mery Hospital, Watertown, and the Noble Hospital, of Alexandria Bay, will all receive equipment for the treatment of patients stricken with infantile paralysis from the Jefferson County chapter of the National Foundation of Infantile Paralysis, Incorporated Stephen A Joynt, who retired as chairman of the county chapter, reported that the applications made by the three hospitals for the equipment, purchased by the local organization, have been approved *

Through the generosity of several friends, the Emma Laing Stevens Hospital, in Granville, is the recipient of an "Electrocardiograph," a machine that photographically records the heart cycles, thereby aiding the establishment of an accurate diagnosis in heart aliments.*

A new ruling, designed as an extra safeguard for babies in the nursery has been approved by the Flushing Hospital Board of Trustees upon recommendation of the Medical Board, Official Referee John M Cragen, president of the board, announced recently

It provides that all babies weighing five pounds or less at birth, whether private or house patient, will be placed under the care of a member of the pediat-

nc staff

"As a pediatrician is better equipped to care for premature babies than general practitioners or other specialists, we have adopted this rule to safeguard the health of the premature babies as well as that of other babies in the nursery," Judge Cragen said

"It will mean a lesser number of doctors entering the premature nursery and will provide an additional safeguard to all patients in the maternity ward"

Judge Cragen revealed that the new facilities on the second floor, which will add 12 beds to the maternity ward and which will mean the completion of the entire hospital buildings, will be opened for use as soon as the hospital is able to obtain the 17 nurses needed to staff the new rooms *

Three hospitals—Beth Israel, St Vincent's, and Beekman, all in New York City—each received an iron lung recently as a gift from Progress Lodge of Masons The lodge, which has a membership of 200, also presented ten wheel chairs that cost \$100 each to the National Foundation for Infantile 'Paralysis *

A new portable resuscitator was recently presented to the Rochester General Hospital by the Flower City Chapter, Order of the Eastern Star The resuscitator, first of its type in the city, will be added to ambulance equipment for use in water, gas, electric shock accidents, and similar emergen-

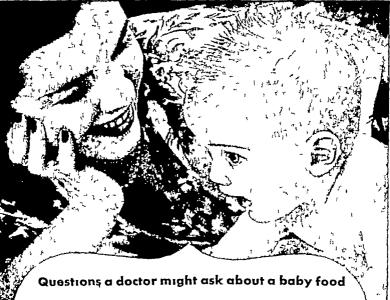

ALLERGY DRUG PRESENTS SERIOUS INDUSTRIAL HAZARD—DROWSINESS

Two Rochester, NY, doctors warn that benadryl, a very effective drug for allergic skin diseases, is dangerous to persons operating any kind of machine, especially an automobile, because it may produce drowsiness, according to an article in the September 28 issue of the Journal of the American Medical Association

Benjamin J Slater, associate medical director, Eastman Kodak Co, and Nathan Francis, of the Medical Department of the Eastman Kodak Co, in Rochester, state that "because of this narcotic side reaction incident to the taking of benadryl, the drug may be a serious hazard when used by persons operating automobiles or in industry operating moving equipment or machinery"

In their series of 65 cases, the authors point out that drowsiness was a common symptom in 25 "This figure should be increased somewhat," they say, "as many of our patients were instructed to take the drug on v at bedtime. Invariably they reported that they about better than usual. Drowsiness may occur from one to three hours after taking benadryl, and this drowsiness may be cumulative if the drug is continued."

A case report of one of their patients serves to illustrate how dangerous the effect of the drug may prove A 20-year-old man was given a 50 milligram capsule of this drug to relieve severe symptoms of hay fever The second day of treatment he took the capsule just before going to work. He complained of feeling drowsy An hour later, while driving an electric platform cargo truck, he lost control of the truck and it fell off the platform Fortunately, he jumped in time to avoid injury

Where do your raw materials come from?

Vegetables are grown from seed supplied by Beech Nut Only that part of the crop which conforms to highest standards is used Fruits are selected with equal care

How are these foods processed?

To retain flavor and food values in high degree all foods are cooked in the absence of air vacuumed and then pressure cooked in stainless steel cookers. The filled jars are finally processed in pressure recorts

Canyoubesurequality
is constant?

Tests for vacuum retention are run on sample jars from each retort after incubation for two weeks at 98°F and 13°F Flavor color, consistency are checked continuously in the test Litchen Cleanliness of plant equipment is controlled by bacteriologists

Beech-Nut STRAINED & JUNIOR Foods for Babies

PACKED IN GLASS A most important fact to remember when you recommend baby foods to mothers

REVIEWED

Pulmonary Tuberculosis in the Adult Its Fundamental Aspects By Max Pinner, M D Octavo of 579 pages, illustrated Springfield, Ill, Charles C Thomas, 1945 Cloth, \$7 50

One of the very best books on pulmonary tuberculosis to have come out in recent years is this present one by Dr Pinner The book is totally unlike all others on the subject. It is not in any sense a typical textbook. Rather, he has approached his subject from a broad philosophic viewpoint and with eminent success has succeeded in welding the clinical, pathologic, and epidemiologic aspects of the subject into one complete unit. It should be on the "must list" of every student of internal medicine and surgery

A mastery of English prose writing makes this work of Dr Pinner's at once most readable and informative

FOSTER MURRAY

Experimental Catatonia. A General Reaction-Form of the Central Nervous System and Its Implications for Human Pathology By Herman Holland de Jong M D Octavo of 225 pages, illustrated Baltimore, Williams & Wilkins Co., 1945 Cloth, \$400

The author was the director of the Neurophysi ological Institute and head of the outpatient department of the Amsterdam University Neurological Clinic In May, 1940, he escaped from Holland and finally came to America, and at present is associate professor at the Duke University Medical School Thus, once again, America is enriched by the tyranny that enslaved Europe Catatonia manifests itself in various ways in the animal kingdom. Although it is rather easy to recognize in mental patients, its etiologic features are still a matter for discussion. The author has moved the syndrome of

[Continued on page 82]

Constant Temperature room—where Lanteen Jelly digests in huge vats until it reaches just the right consistency before going to the filling machines typical of the modern equipment in Lanteen Medical Laboratories Control of the efficacy of its products, by latest scientific means is the constant aim of Lanteen Medical Laboratories. Lanteen Lilac (Mensinga type diaphragm) is available on the prescription of a physician

Since patients are not mechanically minded, simplicity and ease of handling are prime requisites for continued use, Lanteen Lilac flat spring disphragm is extremely simple to place—it is collapsible in one plane only Noinerri rrequired.

LANTEEN

CONTROL I 1944, LAUTEUM EMPLAL LABORATORIES, INC., OFFICARO

[Continued from page 80]

catatoma from the realm of clinical speculation, to the field of experimental exploration. He shows that it could be produced in a great variety of ways, the common denominator being a derangement in the metabolism of the central nervous system Bulbocapnin was the first drug employed in his experiments. He soon showed that a great number of substances were capable of producing catatomic symptoms. He proved that cellular asphysication in the central nervous system was the basis for this syndrome. The book is a highly scientific contribution to medical science, one that should have a great appeal to neuropsychiatrists

I J SANDS

Manual of Diagnosis and Management of Peripheral Nerve Injuries By Robert A. Groff, Lt Col. (MC), AUS and Sara Jane Houtz, First Lt., (PT), AUS Octavo of 188 pages, illustrated Philadelphia, J B Lippincott Co., 1945 Cloth, \$6.00

This 178-page monograph presents a concise evaluation of peripheral and cranial nerve injuries with the complete elimination of extraneous subject matter. The technic of exposure and repair is described particularly well. The section dealing with muscle testing is thoroughly illustrated by simple

schematic diagrams

On the debit side, the book could be considerably enlivened with sufficient actual case histories to demonstrate the course of events in connection with the more commonly injured nerves, particularly, the handling of extensive nerve defects could be discussed at greater length, since this type of injury represents one of the most crucial problems in nerve surgery. Also, some of the basic anatomic data need revision.

RICHARD GRIMES

Biological Actions of Sex Hormones By Harold Burrows, Ph D Octavo of 514 pages, illustrated Cambridge, England, Cambridge University Press, (New York, Macmillan Co), 1945 Cloth, \$8 50

Dr Burrows' work represents an impressive survey of our up-to-date knowledge on gonadotropic and steroid sex hormones. It favorably differs from previous presentations, for it discusses not only the effects of these hormones on sexual organs and activities but also their various metabolic effects as well as stimulation of other organs and tissues. One would be inclined to look at this work most favorably if it were not for the not uncommon failing of the theoretical laboratory worker whose attempts at being comprehensive and meticulously thorough stop short in respect to clinical matters. We are informed about all the reactions of the rat or other laboratory animals, yet discussion of the reactions of homo sapiens is avoided, sometimes altogether, or dealt with in a perfunctory way. Thus, this book, although of considerable value to the research worker and student of endocrine physiology, has but little to offer to the clinician who seeks more directly pertinent information as to the clinical use of sex hormones in humans.

M A. GOLDZIEHER

Diseases of the Nervous System Described for Practitioners and Students. By F M R Walshe, M D Fourth edition Octavo of 360 pages, illustrated Baltimore, Wilhams & Wilkins Co , 1945 Cloth, \$4 50

This is the fourth edition of an English publica-

tion that has had a warm welcome by the profession. The fourth edition was made necessary because of progress in the broad field of neurology. The newer methods of treatment and diagnostic procedures are included, as well as the more recent approaches to the management of the general neurologic disorders discussed. The book is well written, simple, yet quite inclusive, and should retain its popularity with students and the general practitioners. It is recommended because of its clarity, brevity, and, at the same time, thoroughness.

I J Sands

Personality Factors in Counseling By Charles A Curran, Ph D Octavo of 287 pages, illustrated New York, Grune & Stratton, 1945 Cloth, \$400

Personality growth and development are becoming more and more a major study, not only on the part of educators and psychologists, but also for practitioners of medicine Chief concern is no longer with only tissue pathology, except in a setting of the

person who has the illness

The present volume starts from the facts of analyzing the phonographically recorded verbal reactions and productions of twenty counseling interviews. Herein, Father Curran uses the non-directive relationship method, which has some kinship to the free association method of psychoanalysis. The physician cannot help but profit from the experience these workers are critically digesting and utilizing in the interview situation, which is also a psychotherapeutic one. It pointedly brings into focus the inestimable importance of critical weighing what everyone says and does in the presence of the patient by reason of its effect in modifying the client's or patient's reactions, making for or against adjustment.

Besides having pertinent implications for physican-based relationships, it also is highly thought-provoking toward re-evaluating and reformulating-educational methodology in general. Group therapy and interpersonality relationships are not minimized, but rather are viewed in the light of the primary as well as complementary need of further studies about individual personality functions

Frederick L Pater

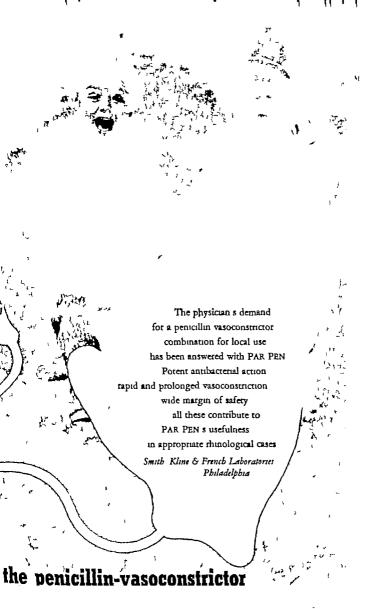

Der Elektrische Unfall Als Pathologisch-Anatomisches Klinisches Und Unfallmedizinisches Problem By Flitz Jenny, M D Octavo of 144 pages, illustrated Bern (Switzerland), Medizinische Verlag Hans Huber, 1945 Board, Swiss

Francs, 12 50

This book contains everything a physician confronted with an electrical accident should know There is an excellent description of the changes caused by electric currents in the various tissues, organs, and systems of the human body, with special thoroughness as to the heart, the central nervous system, and the diabetic manifestations The difsystem, and the diabetic manifestations ferential diagnostic difficulties in certain compensation cases are very well taken care of The chapters on therapy include a very good discussion on the value of artificial respiration and other attempts to restore life in the "seemingly" dead arty to get familiar with electrical accidents is emphasized in the chapter dealing with prevention, in which the author stresses the ever-widening use of electrical appliances not only in industry, but, also, especially in the daily life in the households little book represents a valuable addition to the medical literature

MAX G BERLINER

[Continued on page 84]

[Continued from page 82]

The 1945 Year Book of Industrial and Orthopedic Surgery Edited by Charles F Painter, M D Duodecimo of 432 pages, illustrated Chicago, Year Book Publishers, 1946 Cloth \$300

The 1945 Year Book of Industrial and Orthopedic Surgery is another excellent addition to the series previously published and brings up to date the more recent contributions to the literature on orthopedic

surgery and industrial medicine

There is a comprehensive chapter on fractures and dislocations that is adequately and profusely illustrated to supplement the text and an entire chapter is devoted to operative technic. Each chapter is worth reading and the entire publication is an invaluable addition and ready reference for the orthopedist and the physician interested in industrial medicine.

The book is highly recommended by this reviewer

L GASTON PAPAE

Atlas of Surgical Approaches to Bones and Joints By Toufick Nicola, M.D. Octavo of 218 pages, illustrated New York, Macmillan Co, 1945 Cloth, \$5.00

This is a most unusual contribution to surgical literature. Its unique feature is the line drawings of surgical approaches to various parts of the extremities and the spine, together with supplementary drawings illustrating the important stages in the classic operations of these parts.

The structures exposed in the various stages are clearly labeled, making it possible for the surgeon to have a visual picture that is otherwise unobtainable in any anatomy or surgery—a concise text accompanies the various procedures covered. The drawings are an accumulation of the author's research over many years and they were executed by

him from clinic and anatomic studies

This book is invaluable to all surgeons in relation to their problems, involving the osseous structures of the body. There are so many enlightening suggestions regarding technic that it would be impossible to single out one for comment. This statement infers that each and every drawing gives at a glance what frequently involves the perusal of pages of text in the usual surgical presentation of an operative procedure. It is a real contribution to surgery in general and orthopedic surgery in particular.

DONALD E MCKENNA

Fundamentals of Pharmacology By Clinton H. Thienes, M.D. Octavo of 497 pages, illustrated New York, Paul B. Hoeber, Inc., 1945 Cloth, \$5.75 (Medical Students Series)

The purpose of this book, in the author's own words, is "to introduce the student to the subject of pharmacology and to stimulate the practitioner, teacher, and investigator to think in fundamental terms with respect to pharmacology". Dr Thienes has cut out for himself no easy task and he is to be complimented for his attempts even though one could hardly expect from the size of the book to find little more than an "introduction" to the fundamentals of pharmacology.

There may be some justification to the author's point of view that voluminous and expensive texts on so rapidly a changing science as pharmacology are things of the past—It is this reviewer's opinion, however, that this particular text fails to provide

the medical student with a sufficiently broad pharmacologic background for the clinical years ahead

The general plan of the book is sound, and the author follows the pattern of discussing the major physiologic systems and the drugs which affect

The relative stress which is placed on certain drugs, however, appears to be entirely out of proportion with their real significance. For example, the discussion of strychnine, a drug of relatively minor importance in medical pharmacology, runs for six full pages, whereas the discussion of antipernicious anemia factors is limited to one short page.

It is evident that the author is keenly aware of the importance of considering pharmacology as a major preclinical science rather than an ancillary to clinical medicine. What particularly appeals to this reviewer is the emphasis placed throughout the book upon the cellular action of drugs. Dr. Thienes is to be especially commended for putting at the close of the book a thoughtful, well-documented, and stimulating discussion of "The Action of Drugs on Cells" which might well be regarded as the fundamental problem in pharmacology

G L CANTONI

Diseases of the Adrenals. By Louis J Soffer, M D Octavo of 304 pages, illustrated Philadelphia, Lea & Febiger, 1946 Cloth, \$5 50

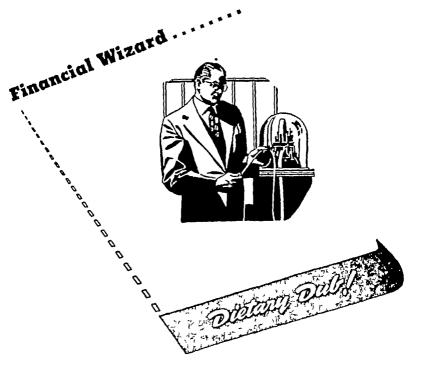

This is a scholarly, authoritative treatise on the diseases of these organs by a student of clinical medicine with years of chemical and experimental research in this special field. It is well written in lucid English, comprehensive, concise, and practical. It contains the latest information for those who are interested in clinical endocrinology, its chemistry, and laboratory methods. Some may object to the grouping of the Waterhouse-Friderichsen syndrome with suprarenal apoplexy. The two-color plates of Addison's disease are outstanding. The hormonal and chemical presentations are masterful. The book is highly recommended for the medical student, clinician, or endocrinologist, and laboratory worker.

BERNARD SELIGMAN

The Psychoanalytic Theory of Neurosis. By Otto Fenichel, M D, Octavo of 703 pages New York, W W Norton & Co, 1945 Cloth, \$7 50

The book is a systematic presentation of the psychoanalytic doctrines by one of the foremost teachers of the time. It is based upon twenty years' experience in teaching psychoanalysis in dif-ferent institutes and training centers both in Europe and in America Outlining the mechanisms common to all neuroses, the author then proceeds to discuss the characteristic features of the indi vidual neuroses Written clearly and yet comprehensively, it covers the entire psychoanalytic field in a masterly manner The subject is simplified so that the beginner may profit by studying the book, and it is so thoroughly covered that even the expert may benefit by reading the volumes. There are over 1,600 references to the most important papers on the different aspects of psychoanalysis. It is a monumental work, that should find a warm wel come by all who are interested in the subject It 15 8 thorough and systematic presentation of psychoanalysis, and is highly recommended

IRVING J SANDS

He may not be one of your patients but you know his dietary counterparts Men—and women—too deeply 'mmersed in unportant affairs to take time to eat properly With them, scanty breakfasts and hasty, badly balanced lunches are the rule dinners which fail to compensate for the defects of earlier meals, far from uncommon The in evitable result is an increase in the ranks of the self-made victims of borderline vitamin deficiency. You know them, too the ignorant and indifferent, food faddists, persons on self imposed and badly

balanced reducing diets alcoholics excessive smokers and many others For all of them dietary reform is first in order, of course. Dayamin Capsules may well be second. One easy to-take Dayamin Capsule supplies the daily optimum requirement for an adult of vitamins A, B₁ C, D, riboflavin and nicotinamide, plus appreciable amounts of pyridoxine hydrochloride and pantothenic acid In bottles of 30, 100 250 and 1 000 Pharmacies are stocked and will welcome your prescriptions Abbott Laboratories, North Chicago Illinois

[Continued from page 84]

The Diagnosis of Nervous Diseases. By Sir James Purves-Stewart, M D Ninth edition Octavo of 880 pages, illustrated & Wilkins Co , 1945 Cloth, \$11

This is the ninth edition of a book that first appeared forty years ago. It has served as a bond between American and English neurologists. The author has contributed much in elucidating basic principles in neurologic diagnoses. His book has been considered as a sound work, and has been used extensively for student instruction. The ninth edition retains most of the good points of the older editions and, also, the newer contributions to neurologic diagnosis. It is truly a masterful book, one that has much to offer to the student, the general medical practitioner, and the neurologist. The 358 illustrations are well selected and add to the value of the book. It is highly recommended as a basic work in neurologic diagnosis.

IRVING J SANDS

Structure and Function of the Human Body By Ralph N Baillif, Ph D, and Donald L Kimmel, Ph D Octavo of 328 pages, illustrated Philadelphia, J B Lippincott Co, 1945 Cloth, \$300

This small book of a little over 300 pages is a clear and concise presentation of the Structure and Function of the Human Body. It is a well-written treatise on the anatomy and physiology of the human body, starting with protoplasm and cells and ending with the nervous system.

Each system is thoroughly described, grossly and histologically, and its function explained. The illustrations are well done and are sufficient in number. The chapters on the circulatory and digestive

systems deserve special mention

The final pages of the book contain an excellent glossary It is not only complete in its context, but also gives the proper pronunciation of the words defined therein

This book is invaluable not only for medical students, science students, and nurses, but also for

physicians.

ALFRED H. IASON

Synopsis of Gynecology Based on the text-book, Diseases of Women By Harry Sturgeon Crossen, M.D., and Robert James Crossen, M.D. Third edition Duodecimo of 253 pages, illustrated St. Louis, C. V. Mosby Co., 1946 Cloth, \$3.00

This book is just what it is said to be—an outline of the essentials of gynecology—It is intended only for those who wish to acquaint themselves with the barest essentials of the subject—Since it is very sketchy, and in no sense a textbook, its field of usefulness is limited

CHARLES A. GORDON

Cosmetics and Dermatitis By Louis Schwartz, M D, and Samuel M Peck, M D Octavo of 189 pages, illustrated New York, Paul B Hoeber, 1946 Cloth, \$400

In this day and age, when most of our womenfolk are confirmed cosmetic habitués or regular patrons of the beauty parlor, the family doctor is

frequently called upon to diagnose and to treat some form of dermatitis, the cause of which may prove difficult to determine The recent war brought many changes in the composition of standard preparations of long-standing reputation Expecially was this so in the cosmetic trade, and it would be unfair to expect the medical man to be familiar with the substitutions necessity frequently commanded

For years, it has been the persistent task of such men as Dr Schwartz and Dr Peck to protect the general public from unreliable preparations This new book, small though it be in size, contains more real, authentic information on its subject than any in our immediate recollection. Not only do its 24 chapters include a concise exposition of the anatomy and physiology of the human skin and its appendages, but every type of cosmetic, its composition and proper usage is described Few men are as well equipped to handle the subject of dermatitis as are the authors because their daily contact with every form of the disorder, its causative factors, and its relief, and even its prevention, has made them the masters of the subject This little volume, so handsomely printed by the Hoeber Press, should find a large sale among the profession, and as well, among the cosmetologists and the users of their products

NATHAN THOMAS BEERS

The Medical Clinics of North America. Second Service Command Number March, 1946 Octavo Philadelphia, W B Saunders Company, 1946 Published Bimonthly (six numbers a year) Cloth, \$16 net, Paper, \$12 net

This number stresses the following—the importance of tuberculosis in "primary idiopathic" pleural effusion and its diagnosis, the recognition of miliary tuberculosis in obscure fevers, atypical character of some cases of tuberculous meningits, the giving of iodine ten days before operation in thiouracil-treated cases of hyperthyroidism, and the diagnosis and treatment of intervertebral disc rupture. These articles all emanate from the Second Service Command and while the title is Medical Clinics of North America, Problems in Postwar Medicine most of the articles will be found important in civilian practice.

MEYER A. RABINOWITZ

A History of Medicine By Douglas Guthrie, M D Octavo of 448 pages, illustrated Philadelphia, J B Lappincott Co, 1946 Cloth, \$600

History is usually recorded in terms of the lives of famous men A History of Medicine consists of a series of brief biographic notes, held together by a background of interesting comment on the times in which these great men lived At the start, however, our author speaks up for the myriads of unknown collaborators, quoting Sir Thomas Browne, thus "Who knows whether the best of men be known, or whether there be not more remarkable persons forgot, than any that stand remembered in the known account of time" A cock for Esculapius and at least a chick for each sincere disciple!

ANNOUNCEMENTS

THE UNIVERSITY OF THE STATE OF NEW YORK THE STATE EDUCATION DEPARTMENT BOARD OF MEDICAL EXAMINERS

To the Secretaries of the Medical Boards of the United States

Gentlemen

This is to notify you that Dr George A Crump of 672 East 219th Street, New York City, holding New York license No 50124, dated November 3, 1899, has permanently retired from the practice of

medicine in the State of New York

Dr Crump was registered for the year 1943
from 672 East 219th Street, New York City

Yours truly, (Signed) Jacob L Lochner, Jr , M D , Secretary N Y State Board of Medical Examiners November 15 1946

To the Secretaries of the Medical Boards of the United States

Gentlemen

This is to notify you that Dr Daniel Duane Parrish of 318 West Manlius Street, East Syracuse, New York, holding New York license No 5031, dated October 14, 1901, has permanently retired from the practice of medicine in the State of New

Dr Parrish was registered for the year 1946 from 318 West Manlius Street, East Syracuse, NY, but the registration is terminated as of this date

Yours truly, Jacob L Lochner, Jr, MD, Secretary NY State Board of Medical Examiners (Signed) November 13, 1946

To the Secretaries of the Medical Boards of the United States

Gentlemen

This is to notify you that the Board of Regents at a meeting held October 18, 1946, VOTED, That, pursuant to the provisions of sub-division 1 of section 1264 of the Education Law, medical license No 31238, issued under date of January 28, 1936, to Frank Celano, Westbury,

through indorsement of his Maryland medical license, and permitting him to practice medicine in the State of New York, be revoked, annulled, and canceled, and that his registration or registrations as a physician wherever they may appear, be ordered annulled and canceled of record, and that the Commissioner of Education be empowered and directed to execute, for and on behalf of the Board of Regents, all orders necessary to carry out the terms of this vote

Dr Frank Celano was registered for the year 1946 from 351 Madison Street, Westbury, Long Island, NY The order was served on Dr Celano

on October 28, 1946

Very truly yours,
(Signed) Jacob L Lochner, Jr, M D, Secretary
N Y State Board of Medical Examiners November 15, 1946

To the Secretaries of the Medical Boards of the United States

Gentlemen

This is to notify you that the Board of Regents at a meeting held October 18, 1946,

VOTED, That, pursuant to the provisions of subdivision 1 of section 1264 of the Education Law, medical license No 1570, issued under date of June 8, 1896, to Frederick Charles Steuart, Sag Harbor, permitting him to practice medicine in the State of New York, be revoked, annulled, and canceled of record, and that the Commissioner of Education be empowered and directed to execute, for and on behalf of the Board of Regents, all orders

necessary to carry out the terms of this vote

Dr Frederick Charles Steuart was registered for
the year 1946 from Sag Harbor, N Y The order of revocation was served on Dr Steuart on October

29, 1946

Yours sincerely, Jacob L Lochner, Jr, MD, Secretary NY State Board of Medical Examiners (Signed) November 15, 1946

HEALTH IN 1799

Dr R Squirrell gives the following advice in the third edition of his little book entitled, Making of Health, Being an Abridgment of an Essay on Indigestion, Including Also a Treatise on Sea and Cold Bath-ing, London, 1799

Bathing The best time of year for bathing, in

general, is to commence about the middle of April, or beginning of May, according to the temperature of the season, and to continue it no longer than a month, or six weeks at a time, and it should never be employed later in the season than the beginning of November

Swinging is productive of great benefit to the con stitution

Study Excess of study is so powerful a cause of indigestion, nervous diseases, hypochondriasis, and the gout, that I find very few men of learning are free from these complaints Intense thinking wears out the constitution more than the most laborious exercise

For the cure of all sorts and conditions of trouble, Dr Squirrell recommends the use of his tonic powders, in packets, and tonic drops, in bottles - Army

Comparative studies have shown that in some cases better control of grand males well as petit male sezures can be obtained with Mebaral than with corresponding aloses of phenobarbital or diphenylhydantoin sodium. Mebaral is usually well tolerated and courses little or no drowsiness. The fact that it is testeless simplifies its administration to children.

Meheral may also be given in combination with Luminel or diphenylhydantoin sodium.

The average dose for adults is from 3 to 6 grains daily; for children, from $\frac{1}{2}$ to 3 grains. Tablets 0.03 Gm. ($\frac{1}{2}$ grains), 0.1 Gm. ($\frac{1}{2}$ grains) and 0.2 Gm. (3 grains).

treatment of

cough

ESKAY'S ORALATOR, an oral inhaler, applies an entirely new principle to the treatment of cough

The Oralator contains a remarkable new anesthetic analgesic compound-2 amino 6-methylheptane, S K F The vapor of this compound is carried by inhalation directly to the principal zone (see illustration) where the cough reflex originates There it checks cough almost instantaneously

by local action at the periphery

The effectiveness of

Eskay's Oralator

extensive clinical trials 77% of the patients were benefited

Smith Kline & French Laboratories, Philadelphia, Pa

In the Early Recognition of Protein Deficiency

Unsupervised dietary curtailment and self-imposed food restrictions, not infrequently observed in elderly patients and in those desirous of preventing weight gain or losing weight, are apt to lead to multiple nutritional derangements. Not the least important among these, and often overlooked, is protein deficiency

The early symptoms of chronic protein deficiency are vague and lack specificity. Thus they escape detection unless pointedly looked for Easy fatigability, loss of weight, anorexia, malaise, and a slight pallor due to underlying secondary anemia constitute the most common complaints. A careful history of eating habits usually discloses the true significance of these symptoms

Detection of the earliest objective sign of protein deficiency—negative nitrogen balance—requires hospitalization for several days, in order that nitrogen intake and excretion can be accurately determined.

Prolonged protein deficiency leads to hypoproteinemia, and is readily recognized by generalized edema and by a serum protein level below the normal 7 to 8 Gm. per 100 cc.

The most dependable and effective means of preventing and correcting protein deficiency is through proper organization of the diet. The recommended intake of i Gm of protein per Kg of body weight insures nitrogen balance in normal persons For correction of frank protein deficiency, at least 2 Gm. per Kg of body weight—and frequently considerably more—is required.

Among the protein foods of man, meat ranks high, not only because of the generous supply of protein it provides, but also because its protein is biologically complete, applicable for the satisfaction of every protein need.

The Seal of Acceptance denotes that the nutritional statements made in this advertisement are acceptable to the Council on Foods and Nutrition of the American Medical Association

the answer to safer sulfonamide therapy

Combisul-TD

Combining the mo t effective sulfonamides i a sound therapeutic principle It follows directly from the experimental and clinical demon tration * that admini tration of such mixtures significantly minimize the likelihood of renal toxicity

Behard this new combination of sulfonamides is the physical principle that a saturated aqueous solution of sulfathia ole can in addition be fully suturated with sulfadia inc permitting both compounds to be present in one and the same solution in concentrations as great as if each were present alone. Since sulfa namides do not influence each other with regard to their particular solubilities, the danger of intrarenal drug precipitation from a mixture of sulfonamides should be only as areas as if each compon at had I een admini tered alone and in the turtial do age contained in the combination Hence the use of only half the cu tomary dosage of ulfathluzole plus half the customory dosage of ulfadiazine reduces hazards proportionately Bacteriostatic activity of COMBISULTD Tables I equal to that attained when either drug is administered alone in full dosage

COMBISUL TD cont has \$25 g am. Hathlered and 0.25 gram sulfinding over tetal [\$5 gram per tablet. The 1 die times for ... nd the design of COMBISUL-TD are the same... for like drug alone Meninghis i exception for which COMBISUL DM-a combination of 0.5 gram 4 0.25 gram sulfan rause-is liable Bottles of 100 and 1 000. lled lette

aptimum symptomatic primagement by spesticity

pavatrine with phenobarbital (B-diethylaminoethyl fluorene 9-carboxylate hydrochloride)

Parasympathetic nerve tissue smooth muscle fibers central nervous excitation—all three contribute to the syndrome of gastrointestinal spasticity

The musculatropic neurotropic effects of the synthetic antispasmodic Pavatrine combined with the sedative action of phenobarbital provide a valuable adjunct in the management of the symptoms of spasticity

Indicated in gastrointestinal spasm dysmenorrhea spasm of the urinary bladder and related conditions.

JOHN CHALMERS DACOSTA-1863-1933

Durgeen and Teacher

Associated with his alma mater Jefferson Medical College, for forty years, John Chalmers DaCosta became the first Samuel D Gross Professor of Surgery He was on the staff of the Philadelphia General Hospital and served for many years as consulting surgeon of that famous institution.

He distinguished himself as editor of the American edition of Gray s. Anatomy and as author of the widely extermed 'Manual of Surgery' Because of his knowledge and genial wit, visiting physicians and surgeons seldom missed an opportunity to attend his clinics, and his surgical teaching has permeated every portion of the civilized world

In recognition of our responsibility to further the progress of medicine and pharmacy we pledge adherence to a research program de signed to develop products which will meet the most exacting requirements for purity uniformity and therapeutic effectiveness.

The very state of nervous ten inters and sleepless ness, which calls for safe, symptom free sedation, is also apt to make the patient captious rebellious to medication

Elixir Butisol Sodium proves gratifyingly useful at such times It's fresh green color palatability and appealing fla vor helpto convince the patient that something different is being done for him

ADVANTAGES

- Intermediate duration—5 to 6 hours.
- Therapeutically effective in small desage
- Low toxicity—wide margin of safety
- · inactivated in body independent of renat excretion
- · Onset of initial effects prompt and smooth.
- · Provides refreshing sleep-no lethoray or duliness on awakening

INDICATIONS

Day-time sedation Insomnia Menopausal hysteria Neuroses Preoperative tension and apprehension

Obstetrical hypnosis

State

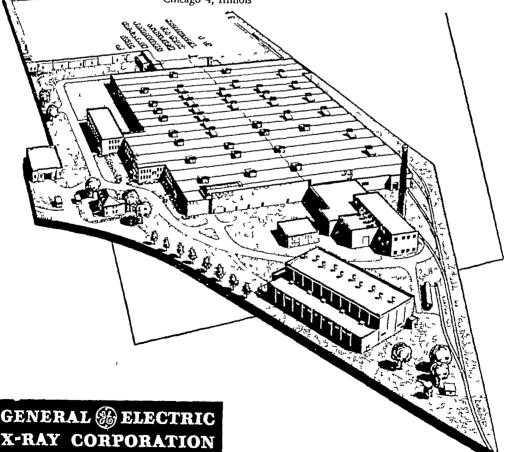

We think it s a healthy sign when a 51 year-old organization has grow ing pains. And our remedy is the purchase of a new 43 acre plant located in Milwaukee. It includes adequate provision for expanding production and accelerating engineering research and development of radiographic and therapeutic apparatus.

Important to you is the fact that the move from Chicago to Milwaukee will mean no interruption of the production schedules established to meet present delivery promises

Our Chicago plant will continue to run at full capacity. The Mil waukee plant, already in operation, will gradually assume an increasing share of the manufacturing load.

Here, in this modern manufacturing facility, is concrete evidence of our plans to meet present and future demands of your profession. And your demands will be met without sacrificing the high quality and efficiency that have always characterized the products of this organization. General Electric X Ray Corporation. 175 West Jackson Blvd, Chicago 4, Illinois

Infron

once-a-month

dosage

in rickets

prophylaxis

As effective as it is simple. Infron prophylaxis of rickets leads the way in the modern approach to an old problem that of adequacy in antirachitic protection.

Modern Simplicity:

In line with the current trend to eliminate complexity in nutritional deficiency prophylaxis. Infron Pediatric has the ready accept ance of physician parent and patient alkowith a resultant high degree of cooperation.

Modern Adequacy:

Clinical studies have shown that once-a month oral administration of Infron Pediat no provides adequate protection safely and economically Pediatric

Infron Pediatrio is readily dispersible in the inf at a feeding formula milk, fruit juices or water and can also be given in cereal.

Each capsule of Infron Preliatric supplies 100,000 U.S.P. Units of vitamin D— Whittier Process—especially prepared for pediatric use. One package contains six monthly administrations, each in an enilly-opened capsule container

ETHICALLY PROMOTED

HOW INTRADERM SULFUR WORKS IN ACNE VULGARIS

A NEW standard of effectiveness in skin penetration for the treatment of some vulgaris is established by Introderm Sulfur

The treatment combines the new principle of skin

penetration with the well-established effective action of sulfur in some Highly active sulfur is deposited in the none lesions, right down in the folkeles and selon ocquis glands. The process is shown in the illustrations.

1 Acue pustule Distension of folliele and echaecous gland by plug in osteum of pilo-schaecous upparatus. Plug connects of schaecous accretion home material, cell detritus. It is

Ingredients Sulfur (as sulfide and poly sulf les) o 16% triethonidamine 100 sudium whitedalkyllieuseuesulf vait 11 m autif prine 11.00 propplene glycul writer

infected with micro-organisms. The entire complex is surrounded by in flammatory infiltration.

Yellow shading shows early phase of penetration of active sulfur compounds from the applied Intraderm Sulfur Solution

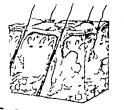

2 Detergent action of Intraderm base softens and removes greasy film from surface and loosens follicular plug Active sulfur has pene trated farther

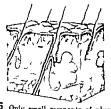

3 Active hyperenna. Increased filling and dilation of vessels and enpillaries Enhanced defense mechanisms, absorption etc. Sulfides have diffused from perifolicular tissu upward into epidermia

4 Keratolytic effect has renched the peak. Adds removal of plug and stimulates regeneration of surface structures. Sulfides present practically throughout cutaneous structures.

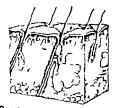

5 Micro organisms durategrate Cradual absorption of infiltration Most of the plug has passed out from follicular osteum Schaccous gland less dutended

Only small remnants of plugs vanish.

7 Skin freed from inflammatory lesions plugs, and fatty film

8 With continued applications of Intraderm Sulfur fresh lesions are aborted early in their course.

in hemorrhoidal disorders

Education in itself is a slow process Education of the patient suffering from a hemorrhoidal disorder in the use of local medication is both difficult and slow. For the patient invariably stops the medication when symptoms are relieved, although complete recovery has not yet been effected. To facilitate complete recovery in hemorrhoidal disorders the patient should be "educated" to continue treatment for three to four weeks after the acute symptoms are relieved.

The patient's cooperation throughout treatment is easily obtained with ANUSOL Hemorrhoidal Suppositories

Anurol Hemorrhoulal Suppositories are safely used for prolonged treatment because they constain no narcotic no ameribeite no analgetic no hemostatic Anusol does not mask serious pathology. There are no systemic by-effects,

THE FREQUENTLY OVERLOOKED

human Phase of HUTRITION

UMAN nutrition presents many phases not encountered in experi mental studies. The laboratory animal driven by hunger, will cat and thrive on any food substance that is adequately nutrient. Taste and variety and meal satisfaction are of little moment in such nutritional studies.

In human nutrition, the joy of cating, and especially the satisfaction of having eaten well, play an important role. Frequently though physiologic hunger has not come about, it is the pleasant memory of the last meal that engenders the appetite

To add satisty value to the meal, candy may well serve as its last course. Even an otherwise drab meal gains much when topped off by a piece or two of candy

Confections in the manufacture of which milk, butter eggs fruits, and nuts or peanuts are used, are particularly suited for this purpose. This is true because of their universal taste appeal, but also because they contribute small amounts of many essential nutrients

1 Candles in general supply high caloric valve

2. Segar supplied by condy requires like digesin small bulk.

tive effort to yield available energy 3 Those condies in the manufacture of which e those congres in the monetocrere of entities with, better eggs, truls sure, or peanwis are

(a) provide biologically adequate proteins used to this extent also-

and fats rich in the unadversted fatty acids; (b) pretent appreciable amounts of the impor

bearing abbrecome abbehous and iron (c) contribute the nacing and the small associate

An answer that raises a question

Youngsters can quickly settle the question as to who is the bigger. The more subtle question, 'Am I as 'big' as I ought to be?' is more difficult to answer.

Physicians know that an important factor in optimum growth and health is an adequate diet. To assure adequacy of vitamin intake, one or more of the essential vitamins are commonly prescribed.

'Homicebrin' (Homogenized Vitamins A, B₁, B₂, C, and D, Lilly) contains five vitamins known to be most essential for optimum growth and development. Up to two times the optimal daily requirements are provided in approximately one teaspoonful (5 cc) 'Homicebrin is pleasant to the taste and is miscible with milk, water, or orange juice. It is available in bottles of 60 cc and 120 cc at retail drug stores everywhere

Voluntary Insurance, New York State

What is the present status of the four existing prepaid medical care plans approved by the Medical Society of the State of New York? Certainly, progress has been made in the extension of coverage of individuals and groups during recent months

Latest official figures show that during the first six months of 1946, enrollment in the four plans increased by over 155,000 mem bers, exceeding the entire year of 1945 by over 28 per cent From June 30, 1945 to June 30, 1946 enrollment increased by 230,-671 members, or 119 per cent During this period, United Medical Service, New York City, increased its membership by 168,000, or 158 per cent, Medical and Surgical Care, Incorporated, Utica, 25,026, or 68 per cent Western New York Medical Plan, Incorporated, Buffalo, 32,651, or 67 per cent, and Central New York Medical Plan, Incorporated, Syracuse, 4,824, or 236 per cent the period from June 30, 1945 to January 1, 1946, the increase in members was 74,957 as compared to 155,714 from January 1, 1946, to June 30, 1946 At the present time the four plans have a membership of approumately 480,000 and at the current rate of increase there will be approximately 600,000 members as of December 31, 1946 does not include any enrollment from the Rochester or Albany plans

While the figures showing percentage of increase both for these plans and for United Medical Service as percentages are fairly satisfactory, they do not represent in our opinion all that could be accomplished and which must be accomplished if the voluntary plans are to compete in the public mind with schemes for compulsory health insurance under Federal control

It is true that the rate of growth avoids the difficulty which would immediately arise with the adoption of compulsory insurance on a National scale, namely, the lack of facilities and of medical personnel to implement it properly, but we doubt if the public is or has been made sufficiently aware of the vital importance of this defect inherent in the proposed National health insurance scheme.

To our mind this is an extremely important matter. In the event that the public, in spite of such informed advice and counsel as the medical profession can give it and must give it on this point, should be so foolish as to disregard expert advice and to decide upon the adoption of National compulsory health insurance, disregarding any other objection, the lack of sufficient doctors, nurses, and hospital facilities alone would be destructive of all the excellence which has been available under the present system of the slow growth of voluntary medical care insurance. It is true that the coverage of such insurance is not universal, but in view of the practical points at issue, we think that good coverage within the means of accomplishing it, is better than an attempt at universal coverage which cannot be realized even with the enormous resources of the Federal government behind it

We think that this is a practical matter if expressed in ordinary language the public can understand We think it should be stressed and stressed again by every available means at our disposal The public is, after all, practical and reasonable It would, we think, support our contention on this Every enterprise in this ground alone Nation started as a small business or manufacture or what have you It grew with public acceptance of what it had to offer this offering was acceptable, the small enterprise grew larger and more efficient as the demand increased. We do not think the proposals for medical care can abandon practical considerations for theoretic substitutes proposed by political spenders and theorists whose ideas have been demonstrably cockeyed in whatever country they have been tried.

The progress of nationalization of the coal miners in England at the moment is running into the obstruction of reduced production of such an essential product because of the unwillingness of the now socialized miners to function as the socialists theoretically thought they would. Is there a lesson in this attitude of the English miners toward their socialized industry for what would probably happen to the product of medical care in America under a nationalized compulsory sickness insurance scheme?

The New Physicians' Directory of New York, New Jersey and Connecticut

To those who have waited long and patiently for the publication of a *Directory*, it will be good news that with the paper situation somewhat eased, work is going forward as rapidly as compilation and printing permit

Five years have passed since the last Medical Directory was printed dous changes have occurred during the War years, and the subsequent return of the Army physicians to civilian life mately one half of the doctors in our files have changed their addresses, two thousand post office returns reveal doctors who cannot be contacted, medical societies and hospitals have changed their names, hospital staffs have been completely reorganized, some hospitals have closed And all of these changes have been reflected in the doctor's biographic data Our copy writers have worked ten months recording changes in this data, which includes 35,000 doctors

It has been a difficult job to pick up the threads after five years, but we have done it Although every doctor's hospital appointments have been faithfully checked to keep the biographic data as accurate as possible lack of time and inability to secure proper material from which to work, prevented verifying membership of American Boards and Colleges and National and Local medical societies

The present edition of the Medica Directory of New York, New Jersey and Connecticut is the foi ty-first to appear The first was published in 1899 and distributed to the members of the New York State Medical Association and to the members of the New York and Kings County Medical Associations Through a Committee on Publications, the New York State Medical Association had "ioined in the reissue" of this publication, according to the Transactions of the New York State Medical Association for the year 1899, Volume 16, page 821

Presumably, this statement of "reissue" in the Transactions of that organization had reference to a yearly volume called the Mcdical Register of New York, New Jersey and Connecticut, which was published by the New York Medical-Historical Society and which had appeared yearly from 1862 to 1896.

title, Medical Directory of New York, New Jersey and Connecticut, was not used as such until 1899

In the 1900 edition of this Directory the statement appears on the title page, "Published by the New York State Medical Association." The same statement appears thereafter until, in the eighth volume 1906 it is changed to "Published by the Medical Society of the State of New York."

For those not familiar with medical soci ety history in New York State, certain events deserve recital here. The Medical Society of the State of New York was organized under an act of incorporation in the year 1807 In 1884, owing to a schism within the ranks of its members, a second statewide society was formed under the name of New York State Medical Association Both organizations continued to function-with overlapping membership—until, by legal agreement, they were amalgamated in the year 1905 By this agreement the New York State Medical Association went out of existence, transferring its assets and good will to the Medical Society of the State of New York Since that time the Medical Directory of New Yorl, New Jersey and Connecticut has been published by the Medical Society of the State of New York.

It is interesting to compare certain figures in the first edition and in the forty-first edition relating to the number of registered physicians listed in this *Directory*. The total number in the three states in 1899 was 11,625. In the 1947 edition the total number in the three states is 32,609. In the earlier edition these were distributed in the three states, as follows. New York, 9,199, New Jersey, 1,481, and Connecticut, 945. In the present edition the figures are. New York, 24,777, New Jersey, 5,332, and Connecticut, 2,500.

The House of Delegates of the Medical Society of the State of New York, on May 19, 1906, placed on its books the following resolution which has been strictly compiled with in all succeeding editions "Resolved, that in the Medical Directory of New York, New Jersey and Connecticut, published by the Medical Society of the State of New York, only the names of registered physicians be inserted"

The Directory should be in the hands of members by May 1, 1947

Let Him That Can-Teach

We have just read an article to which we pay high tribute because it has roused us to something approaching the author's state of fury. We are not in perfect agreement with him—we no longer expect to be that with anyone—but we concede that he has something. He is talking about "Trends in Medical Education" and he has the incredible tementy to propose that teachers should be selected with some regard for their ability to teach.

We resist the temptation to quote from him and from the authors he quotes, for if we did, this would no longer be an editorial but a reprint.

To do him as much justice as we can, we shall present our own views, according him full credit for having brought them boiling to

¹ Simpson Edmund D., A Prastitioner's Reaction to Trands in Medical Education, J. A. Am. Med. Colleges 21: 185 (Sept.) 1946. the surface Let us say that he has been the flaxseed poultice to our carbuncle

We think that a medical student should be a man of some premedical culture. He should have some knowledge of history and philosophy. Thus, he will be so sufficiently familiar with the constantly alternating hopes and disappointments of men as not to be swept off his feet by the popular enthusiasm for each new discovery.

He will then be willing to devote four years to the study—we had almost said the mastery—of the fundamental principles of health and disease. He will not say or think that "the best treatment for a disease is prophylactic." One cannot treat something that has not occurred. He will not say "the etiology of pneumonia is the pneumococcus." Etiology is the study of cause, and the pneumococcus we have always with us. He will be much more careful of the

words he uses and what will really interest him will be the more or less philosophic speculations as to why one man with his throat swarming with pneumococci gets pneumonia and another doesn't

He will be glad to give two years of his time to a hospital internship in which he sees and deals with ordinary complaints that afflict ordinary men and women. He will not neglect the five senses that God gave him. When he is called to see a newly returned war correspondent, half starved, debilitated, and emotionally shaken who is suddenly seized with a shaking chill, shortly followed by cough, high fever, pain in the chest, and rusty sputum, he will not put him into an ambulance and drive him thirty miles to a hospital to have his chest v-rayed so that he can tell whether or not he has pneumonia.

After he has mastered that familiar routine—if anyone ever does—he may be tempted to browse over a dean's report such as this "It is apparent that more emphasis than heretofore should be placed upon parasitology, the medical and health problems of the tropics, psychosomatic medicine chemotherapy, the special diseases of adult and old age, biophysics, genetics, industrial medicine, public health, legal medicine, the care and treatment of trauma, especially burns, injuries, and shock, nutrition, the correction of physical defects, and the broad range of environmental factors in health as well as disease"

He will have been so grounded in basic principles, the theory of disease, in fundamentals, that he will be able to scan prospecti like the one from which we have just quoted with the detached and somewhat cymical eye of a hardened buyer from a Sears Roebuck catalogue

He will have been prepared for his ordeal by men who have the gift of teaching a rare one and one which should be appreciated and paid for A research man is seldom, if ever, a good teacher Neither is the prolific writer with his eye on a professorship. because both of them are introverts A good teacher should be a passionate extrovert, a man so overcome by the wonders of the subject he is teaching that he has no thought at all of whether or not the thoughts he is imparting are his own All he wants is to get truth from his own mind into the minds of his pupils, who will be passionately grateful for it

We challenge any of our readers to name three men, with whom they personally have come in contact, who had that gift You can't keep a research man from researching You can't keep a candidate for a professorship—more's the pity—from writing But you can make an earnest effort to discover a man who has the gift of teaching And when you've found him, don't ask him what research he has done or what articles or books he has written Let him teach, and keep your eye forever after on his pupils

Current Editorial Comment

Unfashionable Doctrine Incredible as it may seem, there come days when editorial omniscience loses something of its self-confidence. The principle for which we have been waving banners and tooting trumpets seems to have lost its virginal, untarnished, pearly luster. On such mornings, we turn to other brains for our support. And we find support in very varied sources.

"Sterility"—Heckel has shown that administration of testosterone propionate in large doses may cause an azoospermia in a man with a normal spermatozoa count. This phenomenon conforms to the general bio-

logic principle that the administration of a hormone secreted by a gland of internal sec etion tends to inhibit the gland which produces it"

We quote next from an article by Mr Archibald Rutledge, under the title of "The Blessing of Insecurity" He has observed the effects of a conservation area set up in a swamp whose inhabitants he has been observing for many years

"This is a day when a great many wild game birds are kept in captivity for breeding purposes. The men engaged in this work have become accustomed to the general fall from grace as mothers of such normally fine

¹ Thompson W O Uses and Abuses of the Male Sex Hormone J A M A 132 185

² Rutledge, Archibald American Magazine, p 49 (Sept.)

birds as pheasants What heretofore had been the most important thing in life, the nesting and rearing of young, has somehow lost its appeal and proper place. The hens are careless and dilatory about when and where they lay, they no longer seem inclined jealously to claim their own nests, they are so unreliable about setting that they cannot be trusted to stay on their own eggs until they are hatched. Complete security has apparently demoralized them

"Perhaps they have gained the world, but assuredly they have lost their souls"

The owner of a nearby plantation was not satisfied with the size of the deer upon his property "So he imported a huge stag from Michigan to act as a kind of herd buil. This buck, which had been reared in captivity, was kept for some time in an enclosure on the plantation that had a 7/2-foot wire fence around it. It was in the autumn, the mating season of the deer. A native buck from the man's own place jumped that wire fence at night, killed the great stag more than twice his size, and, once more leaping the fence, escaped into the night."

The small but virile native buck had spent most of his time, not eating and drowsing, but using his strength and his strategy to escape death at the hands of hunters

These two instances so firmly bolstered our thesis that nobody works unless he has to and that nobody who doesn't work is worth much, that we unfortunately fell back again upon our own brain Which took us back to the proud days before our marriage when we used to dress ourself Not only for our own satisfaction, we smugly remembered occasions upon which we had even been congratulated upon our harmonies of hate and spats, socks, shirts, suits, and even neckties Where are those proud days now? We are married to such a perfect wife that we couldn't even find a sock or shirt As to venturing to select a necktic—we shud der at the very idea.

Discouraged, we turned to another source for inspiration—the daily press Miss Elsie Robinson, in her column "Listen, World," was quoting from Mr C E Wilson, president of General Motors, "We have a good deal of absenteesm, perhaps three times the normal prewar"

Asked why, he answered, "I do not know why it is, but a good many people just don't seem to be too much interested in work

If people got 50 per cent as much for not working as they got for working

N Y Journal American Sept 30 1946

I wonder how many people would be tempted by that "Miss Robinson blames the situation on the way we have raised the last two generations. She says that when she was a youngster, "if you wanted to exist you had to work. Any child of five understood that fact. It was in the very air we breathed. No one expected life to be anything but hard."

We return from our divagations with the luster back again upon our standard Our editorial omniscience is almost what it used We were advancing the thesis that hard work and self-reliance are two essentials of existence It's a very unfashionable doctrine It leaves out the State entirely But it is bolstered up by an endocrinologist who tells us that the most essential gland for man's preservation won't work, or even produce, if even a part of its work is done for it by a naturalist who tells us that watched over and petted, the largest stag is no match for the unprotected featherweight of wild life, by our own miserable example, and finally by a columnist of the Hearst newspapers who quotes the president of General Motors

The first extraneous authority that we cited was headed, curiously enough, by the word "Sterility" But as we end our editorial, it almost seems, doesn't it, as if "Security" and "Sterility" were synony mous

Curare in the Treatment of Acute Police myelitis In a recent report of 34 carry For gives his experience with an opinion concerning the treatment of acute prinmyelitis with curare The patients (19 men and 15 women), varying in age form 3 to 33 years, were among those start to the South View Hospital, Myssier Health Department, between July 22 130vember, 1945 Some patients at the hospital on the first day of the circus. others after many days, the lower peroc of delay being sixteen days types of the disease included two spinal bulbar, ten spinal and rine ser spinal paralytic. The Diagnostic Value of Vaginal Smears Since 1917, when Stockard and Papanicolaou introduced the vaginal smear in the study of the guinea pig's sex cycle, the horizon of this procedure's significance and implications has broadened appreciably, especially in the last decade

The value of vaginal smears in human endocrinology has been generally accepted. At the moment, it is in the field of the diagnosis of uterine cancer that the use of the vaginal smear, and more recently, of the cervical, endocervical and endometrial smears is attracting more attention and offers much promise

The rationale of the method is sound since it is based upon the study of exfoliated cells recovered in the secretion of the uterus, cervix, and vagina Carcinoma is an exfoliative lesion

Among the method's limitations, the interpretation and evaluation of the smear is perhaps the greatest. It requires the judgment and experience of one who is well acquainted with the normal and abnormal cytology of the female genital tract. Furthermore, better criteria for differentiation are not yet outlined and standardized. These may be realized when the cytologic changes associated with pregnancy, infection, endocrine dysfunctions, and cancer itself are better understood and classified. Another disadvantage of the method is that the examination of a smear consumes more time than that required for a histologic slide.

Among the advantages of the method, the following should be mentioned The manner by which smears are obtained, fixed, and stained is uncomplicated and inexpensive, and the procedure does not require hospital-In the presence of abnormal cells, the smear enables one to suspect or detect carcinoma in its earliest stages and in unsus-Thus, it becomes a valuable pected cases complement to the more reliable and wellestablished diagnostic aids, such as biopsy and curettage In the field of cancer prevention, it may be widely used as a screening method

However far or near the discovery of the cause of cancer is, the early diagnosis of this implacable disease will always remain paramount. It is hoped that the vaginal smear will prove to be the invaluable aid that it promises to be in detecting carcinoma of the cervix and of the body of the uterus long before any clinical signs or symptoms are manifested. It is desirable, and perhaps imperative that the profession acquaint itself with

the technic of this procedure Numerous articles are now available in the literature

Mice and Cancer Research In the long process of solving the problem of cancer, one of the most useful means of acquiring knowledge is through experimental ob-In its native state. servations on mice unguided by the geneticist, the mouse is singularly free from malignancy taneous tumors in mice were so rare in 1900, they had a commercial value of \$300 00 Thanks to those experimentalists interested in the study of hereditary influences in cancer incidence, the price of mouse tumors today is less than a dollar This change was promoted by the geneticist using restrictive matings to produce inbred or pure strains of mice This multiplied discoveries in pure genetics, and aside from genetics it made possible the detection of the carcinogenic substance in milk

In an interesting paper, Strong, who has personally studied 250,000 mice during nearly thirty years, observes that inbred strains have fewer types of spontaneous tumors of comparatively less malignancy Knowing that long exposure to soot caused chimney sweep's cancer, the organic chem-18ts began a search that led to the synthesis of a powerful cancer-producing substance, 20-methylcholanthrene thor believes that with the three types of tumors (spontaneous, transplanted, and induced) available to cancer investigators, they can produce in experimental animals every degree of malignant cancers and benign tumors that develop in man

His conclusions are distinctly hopeful "The practical application of genetic principles has produced in mice, with the help of the organic chemist, a vast supply of many of the more malignant tumors that afflict mankind at present I express the candid opinion based upon some results already obtained and discussed this evening, that cancer, even in the human species, will eventually be controlled—by gcnetic principles I do not mean by some utopian eugenic practice but by the discovery of the mechanism within the animal body which produces resistance to cancer in all its phases When this is ascertained and completely understood, we are justified in hoping that this principle will control human cancer

EMERGENCY OPHTHALMIC SURGERY

DANIEL B KIRBY, M.D. New York City

(From the Department of Ophthalmology New York University, College of Medicine and Bellevic Hospital)

There is need for a discussion of the indications for surgery in the emergency conditions in ophthalmology, both from the standpoint of those who do their own surgery as well as of those who refer all of their major surgery but who are confronted at times with conditions which give no opportunity for proper reference or for elective consideration. Prompt action is necessary and one may have to proceed without much aid. There may be more need for good surgical judgment under such conditions than when one has time to sit down and calmly think the problem through.

The American Board of Ophthalmology has wisely decided to carry on with its program octification only of those who prove that they are safe ophthalmologists and this means that they are safe also in ophthalmic surgical diagnosis and judgment and that they are safe in doing the ordinary and certainly the emergency ophthalmic operations. It may not be necessary for the ophthalmicogist to do elective surgery in chooses not to do so but he should at least not accept ophthalmic patients unless he is prepared to render adequate necessary emergency care when he cannot put them in the hands of one who will do this for him.

Conditions in Which An Emergency Enucleation of the Globe Is Indicated

There are certain conditions in which enuclea tion is definitely indicated and should be done without delay

- 1 Intraocular neoplasms sarcomata glumata. In the latter condition with nerve involvement an intracranial approach may be necessary
- 2 Ocular trauma extensive perforated lacerated or incised injuries particularly involving the ciliary area. Contusions with rupture of the cilibre.
- 3 Penetrating prritating foreign bodies which cannot be removed well
- 4 Sympathetic ophthalmitis before involvement of the fellow eye
 - o Blind eyes with dislocated lenses
- 6 Eyes that have suffered expulsive hemor rhages
- 7 Nonpurulent endophthalmitis with tender painful sclera.
- painful sclera.

 8 Blind painful eyes with staphylomata or phthusia bulbi

9 Absolute glaucoma, primary or secondary or in huphthalmic and hydrophthalmic eyes

Indications for Implantation into Tenon s Capsule

An implant may be placed in Tenon's capsule in any case in which the enucleation is clean and satisfactory. The presence of an intraocular neoplasm or sympathetic ophthalmits may deter one from using an implant but these conditions do not definitely contraindicate the procedure. The need for shortening the time of the operation as much as possible in clidrily or debulitated per sons may be an argument against the use of an implant in such cases. The motifity and cosmetic effect after implantation has been quite satisfactory.

Indications for Procedures Alternate to Enucleation Although There May Be Many Contraindications to Their Use

Fusceration of the Globe—Lyisceration of the globe should be done in cases of sovere purulent endophthalmitis or panophthalmitis because of the danger of the development of meningitis if enucleation is done and the sheaths of the optionerve are cut under such conditions. In cases of purulent anterior endophthalmitis of lesser degree a crucial incision of the cornea may be used for evacuation of the abscess with enucleation at a later data of their indiented.

Eviscention may be done in any and all of the cases listed for enucleation everet in the presence of intrioccular tumor, or sympathetic uveits or scientis. In certain cases in which there is scientis with painful tender scient, the patient may not be releved of symptoms except by enucleation.

Mules operation of implantation into the eviscention rateria as best exemplified by Burchi or some of the modifications by which the optic and charp nerves are removed may be performed in favorable cases

Progress in Restoration of Motility and Improved Cosmetic Effect

Ruedemann's implantation of a permanent acrylic eye of sufficient size, particularly of the anterior part to fill the orbit, directly after enucleation with suturing of the four rectus muscles to a platinum mesh on the back of the implant is a new departure and offers interesting speculation on its future first in regard to its

Presented at the 140tl Annual Meeting of the Medical Society of the State of New York, Section Ophthalm logy and Otolaryngology May 2 1946

motility when the tissues of the muscle cone become adherent to the entire cone-shaped back of the implant thus making for less rather than more motility, and second, in regard to the permanence of the colors of the iris and of the sclera These points will be decided only after a lapse of Cutler's plan for implantation of a specially designed acrylic basket into Tenon's capsule provides for transmission of excellent motility to the prosthesis through the fitting of the stud on the posterior surface of the prosthesis into the central depression of the implanted basket method provides for renewal of the eye if necessary, or for shifting of the eye without muscle Cutler's resurgery if any deviation develops port is most interesting and the procedure is not more difficult than our present method of enucleation with implantation

Despite possible objections, the methods are essentially new and most interesting and will teach us much. Ruedemann has used the implant in old cases in which no implant had been employed, in others in which the implant was unsatisfactory, and also in sunken and contracted deformed sockets to aid in their restoration. Cutler has said that the basket implant did not work in cases in which a previous ball implant had been removed.

Glaucoma—Indications for Emergency Surgery

Congenital and Infantile Glaucoma —Congenital and infantile glaucoma may present an emergency problem If the child's eye is hard and the cornea is steamy, it is evident that only by prompt relief will the vision be saved and even then the prognosis is poor Recognizing the usual nature of congenital and infantile glaucoma as an anomaly of development of blocking of Schlemm's canal, the only hope hes in an emergency filtration operation to provide a substitution for the absence of Schlemm's canal Glaucoma, secondary to uveit s in children, may require repeated paracentesis and the use of mydratics and cycloplegics and general systemic treatment as in the adult

Glaucoma in the Adult—In dealing with emergency cases of congestive glaucoma in the adult, one must distinguish between (1) primary glaucoma in which the cause is associated with neuropathic, metabolic, circulatory, or degenerative phenomena in which an acute phase develops as a result of blockage of the exit of the intraocular fluids, and (2) secondary glaucoma in which the inflammation is consequent upon necrosis of tissue, local, or distant infection which has produced cohesive exidates and cellular debris that interfere with ocular fluid drainage

Acute Primary Glaucoma (Preoperative Treatment) In the primary form, the emergency preoperative treatment consists of a trial of mi otics certainly not over forty-eight to seventy-two hours, as the latter seems to be the deadline for restoration of any useful vision although there are occasionally cases in which a restoration of 20/100 to 20/40 vision is achieved even after seven or eight days of blindness with high tension Intra venous glucose or magnesium sulfate and retrobulbar injections of procaine and vasoconstrictor agents if not contraindicated may help. A special emergency glaucoma therapy Lit is worth while in any ophthalmic office or hospital It is better to get the tension down, to give the eye a brief rest, and then go ahead with the surgery than to operate under conditions of high tension or to wait and have a recurrence The fellow eve should be watched carefully and every effort made with miotics to prevent its sharing in the attack as experience has shown them very prone to do so

Emergency Procedures in Acute Primary Glaucoma —Basal iridectomy or even almost any type of iridectomy done under the difficulties of acute glaucoma, usually leaving the pillars incarcerated, suffices for the time being to reduce the tension The observation that the technically poor indectomies were the more successful because the incarceration of the iris provided drainage leads naturally to the opinion and decision that iris in carceration as in iridencleises was worth while However, in the acute phase, the iris tissue is congested, thickened, succulent, fragile, and often necrotic and cohesive, and does not act well for dramage purposes By experience anterior sclerectomy, paracentesis, or cyclodialysis in any form are not satisfactory in acute congestive Primary glaucoma

Posterior Sclerotomy —Posterior sclerotomy by knife incision has fallen into disrepute because of the incidence of hemorrhage, and because one does not wish to cut through the retina. However, posterior drainage by a safer form than by incision is trephination through the sclera, then surface electrocoagulation of the sclera to prevent detachment, then coagulation of the bulging choroid and retina to provide posterior escape of either vitreous fluid or gel. The tension is lowered, thus providing better anterior conditions for an immediate anterior drainage operation.

Emergency Surgery in the Recurrence of Acute Glaucoma—A recurrence of increased intraocular tension may require further surgery but as a general principle it is well not to follow with the same type of procedure which failed partially or entirely before—It is well, also, to recognize that there are certain cases which do not respond,

cases in which venous thromboais necrotic and hemorrhagic conditions may well have been present at the start. And while such states nullify any efforts at restoration of vision, certainly all is lost if the tension is continued and emergency measures not taken. There are cases in which the fellow eye is good and all efforts should be directed in the emergency to conserve this eye rather than risk an acute attack of glaucoma or sympathetic ophthalmitis which may develop in this good eye after difficult surgery on an eye which is manifestly lost. It is well to remember that enucleation may be the safest and best emergency operation in such a case.

The Avoidance of Complications -In connection with the emergency treatment of glaucoma it is also well to remember that other or general emergencies should not be produced if they can be avoided. I believe that adrenalin is overrated for its value as an adjuvant to proceine for local anesthesia and in addition to producing symptoms of uncasiness apprehension and nervousness in sensitive patients may lead to further dilatation of the pupil and blockage of the angle besides endangering spasm of coronary or other important vessels. The use of vitamin K or syn thetic parenteral coagulants may be con traindicated because of the danger of clot formation and thrombosis if the platelet count and prothrombin time are normal or if the pa tient has a tendency to thrombosis

2 The Emergency Care of Secondary Glau coma. The acute phase of secondary or inflamma tory glaucoma is best met by repeated paracentess, mydriatic and cycloplegic drugs and foreign protein or other general systemic therapy as indicated. I believe again we should not run the risk of a general emergency by protein shock therapy especially when such treatment may only enhance the inflammation of the eye and when the reaction of the individual is not auitable or when the injection is poorly timed. Less vigorous for eign protein therapy may well give better results.

Ophthalmic Emergencies

Vascular Disease—Central retinal venous closure by thrombosis may produce secondary glaucoma. The end or congestive phase of primary glaucoma may be accompanied by venous thrombosis. This development will modify any emergency surgical approach. In case of central retinal arternal closure the emergency is so acute from the patient's viewpoint that he clamors for emergency care. The surgical should try to decide whether the claudication is produced by thrombosis embolism or continued spasm. He may test the intraocular tension and

if normal or high in cases of embolism or spasm he may try the effect of lowering the tension by paracentesis of the anterior chamber combined with vasodilators. Most of the cases in which relief and return of circulation and vision has been experienced however have been probably those due to spasm, with occasionally one in which the embolic material may be observed to have moved off to a branch of the artery. Certainly the percentage of successful results of emergency surgery must be small, particularly when the phenomena of necrosis of the return as evidenced by the development of opacity and cloudy swelling have set in

Laceration Penetration, Incision Contusion and Rupture of the Byeball —There are two emergency considerations in all such wounds of the globe The first is the conservation of vision of the injured eye the second is the prevention of sympathetic uveits

The nonsurgical care of such cases, the use of local aseptic and antiseptic measures, uveal pigment the test and therapy with antitotanus serum gus bacillus serum cycloplegies, and mydratics nonspecific protein therapy, etc are all important

Emergency Enucleation in Traumatic Cases -The surgical approach to the conservation of vision of the injured eye must be based on its safety in relation to the fellow eye Particularly if there are extensive injuries of the iris and chary body and loss of vitreous the emergency measures adopted are usually on a temporary basis in deference to the necessary psychologic approach and the attitude of the patient and rela tives The shock of the loss of the eve can be rendered easier if tact and proper handling of the patient are employed and a general emergency may thus be avoided However such considerations should not blind the surgeon or the consult ants to the emergency need for enucleation as the safer procedure and the best measure for preven tion of sympathetic ophthalmitis. This has been amply demonstrated in both World Wars I and II The low incidence of sympathetic ophthalmia in military practice as compared with the continued development of such cases in civilian practice and in isolated neglected cases bears witness to this Dependence cannot be placed on the newer sulfadrugs or penicillin for the prevention or cure of this condition There is a relatively short variable period, certainly not over ten to twelve days, in which one is safe in carrying on watchful con servative therapy but this should not be extended to the time when sympathetic irritation and in fiammation have developed because the fellow or sympathizing eye may turn out to be the worse of the two In certain quiet cases the injured eye may be carried and observed for longer periods

Emergency Surgery Other Than Enucleation in Traumatic Cases—Excision of protruding iris, replacement of pillars, avoidance of traumatic cataract, if this is not already present, direct appositional corneal suturing, or the use of a conjunctival flap are all conservative measures when the injury is corneal, but if the injury is limbal and scleral and there has beennecessary excision of ciliary body with or without loss of vitreous, the emergency is grave and very serious and enucleation may well be carried out

Magnetic Foreign Bodies Within the Eye and Orbit -The history of the injury may disclose the nature of the foreign body which has perforated, penetrated or otherwise injured the eye and orbit X-ray localization is important, and with the aid of the Berman localizer, the exact position of a magnetic foreign body may be accurately discovered at the time of operation The knowledge of the position foreign body will help reduce the trauma of removal Particularly now, with our experience in surgery for reattachment of the return it is possible to avoid the long return drag of a posterior foreign body through the vitreous, around the equator of the lens, and out through a corneal or limbus incision, unless a traumatic cataract is already present in favor of a removal at the posterior site through a scleral incision Care should be taken to prevent the development of detachment of the retina and hemorrhage by surface coagulation around the opening in the sclera It may be well to consider removal of all such foreign bodies inferotemporally The condition of the eye after removal of the foreign body will determine its future

Nonmagnetic Foreign Bodies —If the foreign material is nonmagnetic, an attempt may be made to remove it, particularly if it is of such a nature that it produces chemical or inflammatory changes in the eye The use of an endoscope through a scleral incision for intraocular visualization and foreign body removal is justified if the eye will stand the manipulation better than it will the foreign body. If there is glass in the interior chamber and it is recognized by direct observation, by gonioscopy or by bone free antenon x-r w films, then an incision ab externo, lifting of a corneal flap, and removal of the glass particles by the flowing out of the aqueous, or by picking them up with smooth forceps, is indicated The incision should be closed by corneoscleral sutures

Foreign Bodies in the Orbit—It may not be necessary to remove small bits of metal from the orbit, except copper and its alloys which may produce chemical suppuration and necrosis Wood or organic material, however, should be

removed if at all possible it an early date because the granulomatous inflammation which ensues is very destructive and disturbing

The Diagnosis of Sympathetic Ophthalmitis

The recognition of various types of sympathetic uvertis and scleritis comes within the province of this discussion of emergency care flammation developing in the injured eye is of a plastic, fibrinous, evudative, infiltrating type, although the condition may develop in cases in which the inflammation is purulent in nature Cells are seen early in the aqueous and vitreous and later typical adhesive precipitates on the endothelium are developed Exudates on the iris, and infiltration of the iris with irregular nodular vascularized and granulomatous thicken The intraocular ings of the iris are significant tension is not a true index as glaucoma or hi Continued hypotony, potony may be present however, is a grave sign These objective signs combined with symptoms of photophobia, lacri mation, and blepharospasm in an injured or operated eye are great warning signals of the The change from accurate and prompt light projection to inaccurate, slow, guessing, and faulty light projection is a real warning Faulty light projection in a severely injured eve without inflamination is enough reason for emergency enucleation as the best therapy. It is best judgment not to wait for symptoms of sym pathetic irritation in the fellow eye. If there is development of objective signs of sympathetic infiltration of the fellow eye, it may be too late to enucleate

Sympathetic Ophthalmitis After Intraocular Surgery—Such is the nature of ophthalmic surgery that the responsibility is great. Any eye operated upon for glaucoma or entaract, even though the technic be perfect, presents a possibility for the development of sympathetic ophthalmitis. The incision need not be wrong nor the uvea unduly traumatized. The development of severe uvertis and faulty light projection, as detailed above, should be reason enough for the surgeon to sacrifice the object of his loved labor in emergency deference to safety. Fortunately, such emergencies are rare

Emergency Surgery in Traumatic Cataract

The opacity of traumatic cataract, if otherwise uncomplicated, may in young subjects absorb completely and no emergency surgery may be necessary, but if the lens swelling is rapid, glau coma or inflammation may ensue. There will be necessary then an emergency removal of lens debris and of the nucleus by linear or peripheric section. Eyes in which there is an admixture of

vitreous and lens dobres do not do well oven with emergency care

Emergency Surgery of Dislocations of the Crystalline Lens

If there is partial subluxation of the intact lens, the condition may not require emergency surgery and a favorable time may be elected to remove the lens. If there is luxation of the lens through a ruptured sclera the condition is serious and may require enucleation. The production of subluxation of a normal lens with a normal resistant sonule requires much contusing force which in itself is destructive of the integrity of the eyeball and offers a poor prognosis However, if in a case of partial sublixation of the lens in which no inflammation develops and the vitreous is still a viscul gel, one can be sure that as soon as the incision exacuating the aqueous is made the subluxated lens will appear to float up to the comea. It is actually pushed up by the vitreous which comes forward. The general consensus of opinion is that loop extraction is indicated in such cases and that loss of vitreous with incarcoration or pulling up of the ins is inevitable. However this may not always ensue and it may not be necessary to use the loop in every case. If the corneal flap is lifted after the meision, the lens will try to escape course, the vitreous will try to escape also but not in every instance. It may be necessary to grasp the lens and use traction and rotation and stripping to release the remainder of the zonule if this be resistant. The traction with the loop is not a sinecure in such cases because the zonule resists direct traction There is need for the development of a better emergency care for subluxated lenses in the presence of viscid gel vitreous. Complete luxation into viscid vitreous presents a still greater emergency problem less in fluid vitreous. In the latter cases there are other degenerative phenomena and the trauma necessary for the production of luxation may have been slight. If the vitreous is fluid the lons will mak as it does in saline after removal An attempt should be made with the patient in the prone position face down to get the lens or cataract into the anterior chamber through the dilated pupil and then im prison it with miotics contracting the pupil This is not always successful, particularly in con genital cases in which the lens is globular and relatively thicker than the anterior chamber is deep A lens luxated into fluid vitreous may be floated up with a stream of saline and lifted out as Verhoeff has done or the sutures placed the incision made the patient turned over causing the lens to drop into the anterior chamber for casier icmoval as Brackens has done. A lens luxated

into viscid vitreous and fished out with a loop offers a poor prognosis. Lven the aid of fluorecent light does not solve the emergency There is one measure that stands out as important in the surgery of luxated and subluxated lenses and entaracts particularly in the presence of viscid vitreous and that is the preplacement of corneoscleral sutures preferably of the McLean* type. I do not use them in ordinary cataract surgery but I am convinced that they are important and necessary in dislocation cases with viscid vitreous. Another measure that is necessary in dislocation with viscid vitreous is that of a wide indectomy so that no iris will be incarcerated or drawn up by the vitreous which is usually incar Dislocation of the lens particularly luxation either into the vitreous or into the an terior chamber, recuires emergency surgery be cause degeneration inflammation or claucoma will most probably ensue

Emergency Surgery of the Lids and Adnexa

The dense nature of the deep lid tissues and the fact that there is just enough tissue in the normal state renders necessary the avoidance of any débridement in the emergency surgery for repair of cyclid injuries involving the margins Relaxation of the tissues may be produced by lateral canthotomy, or by pedicle flap continuous with the injuried cyclid, or brought down from the upper lid if the lower lid is the one which is injuried.

The hid margin when injured or cut tends to contract so that when joined a slight overcorrection is necessary to avoid notching. The typical laceration through the basal portion of the lower cyclid just nasal to the punctum lacrimalis requires a special plastic correction to avoid the tendency to retraction and eversion of the lid. When the levator has been cut across an effort should be made to reunite the edges, anking particular care not to include any of the deep unyielding fascia orbitalis in the sutures.

If the hid injuries are such that loss of tissue or lagophthalmos endangers the corner through exposure then a suitable emergency procedure must be done to protect the corner

The emergency repair of extensive cyclid in juries is usually unsatisfactory. There is required an elective plastic reconstruction at a later date. I believe that if feasible, a prolonged period of time even up to one year should be allowed to elapse between operations so that the tissues will have sufficient time to resolve and react properly to the second operation. Plastic surgery of the cyclids and orbital tissues should be done by one who is also an ophthalmologist because only the latter can have a proper appreciation of the functions and reactions of the eyes.

Granulomata

Granulomata are not improved by incisions Chalazia, if acute and secondarily infected, may be incised, but as granulomata they require excision and curettement Granulomata or pseudotumors in the orbit may be made worse by incisions

Ulcer of the Cornea

Ulcers of the cornea may, if indolent as in filamentous or dendritic conditions, require curettement and application of half-strength tincture of iodine, while if active and progressive, they may require an emergency Saemisch section or delimiting keratotomy

The Emergency of Neuroparalytic Keratitis and Keratitis with Lagophthalmos

In case of neuroparalytic keratitis with tendency to erosion and ulceration, intermarginal lid adhesions may be made as an emergency conservative measure. No anesthetic is necessary. The exposure due to facial nerve paralysis may not cause alarm, but if necessary, the relaxation of tissues may be relieved by lid adhesions or by canthoplasty.

Emergency Incision of Abscesses

The emergency incision of any abscess large or small may be attended with relief from symptoms if there has been pressure in the abscess. However, one precaution in incising abscesses near the eye is the necessary avoidance of curettement or interference with the pyogenic membrane of the abscess so that there will be no venous transmission of the bacteria to the cavernous sinus for the production of a serious and dreaded thrombosis

Expanding Lesions in the Orbit

Expanding lesions in the orbit causing pressure on the optic nerve or endangering the integrity of the cornea whether due to (1) metabolic disturbance with thyrotoxic or hypothyroid edema and infiltration of the orbit causing exophthalmos. and (2) neoplasms, whether primary in the orbit or an extension from the cranium or metastatic in origin All the latter may demand emergency surgery for temporary or permanent conservation of the eye and its vision, or sacrifice of the eye and the orbital contents In the face of a progressive, noncontrolled evophthalmos, the use of intermarginal eyelid adhesions, canthoplasty, or recession of the levator may be of little avail, but these measures are useful for the protection of the eye in the conditions of proptosis which are stationary, particularly if the trophic nerves are not interfered with, and the lid tissues have good The emergency of diminished corneal vitality

sensitivity and dystrophy, and lagophthalmos due to progressive exophthalmos calls for heroic measures which, unfortunately, are not very successful in diminishing the volume of the orbit Isolated encapsulated orbital tumors may be removed by various approaches according to their location Others may require eventeration of the orbit while still others are beyond surgery Abscesses may be drained, cysts evacuated, and their lining membranes sclerosed by chemical treatment, mucoceles may be excised or drained through the sinuses or nose, the condition of malignant exophthalmos of thyroid disease may be alleviated by the Naffziger intracranial orbital unroofing The prognosis for such conditions is necessarily poor due to the very nature of the conditions present

Summary and Conclusions

The conditions of the eyes requiring emergence surgery have been discussed and the indication given. It was pointed out that ophthalmologist certified by the American Board of Ophthalmology are regarded as safe in ophthalmic surger and, while they may choose not to do electively eye surgery, which is their privilege, they shoul be ready to give emergency care, even surgery until they can transfer the patient to the car of another who will operate if surgery is indicated

The conditions in which enucleation is the operation of choice are given while the substitute for enucleation, combined with implantation particularly those arising out of the experience of the war for providing good motility and appearance of the prosthesis are recorded

The emergency states of primary and secondar glaucoma, vascular disease, ocular traumatic conditions, sympathetic ophthalmitis, injune infections of the lids and adnera, and expandin lesions of the orbit, producing exophthalmos an endangering the eye, all have been discussed i brief and the indications for emergency surgice care outlined

780 PARK AVENU

Discussion

Dr James G Fowler, Buffalo —Dr Kirby, in the most interesting and comprehensive paper, has calle our attention to the numerous urgent surgical procedures which can confront the ophthalmic practitioner. Most of the methods of treatment which he proposes have wide acceptance and need no discussion. Many of them could bear extensive discussion, but time allows my comments on only few.

If there is a choice between enucleation or evis ceration, choose enucleation because convalescenc is shorter and the cosmetic result is nearly as good if an implant is done. If there has been a larg laceration of Tenon's capsule, suture it first, other wise, the implant may migrate through it. We all await with great interest the results to be obtained with newer methods

In infantile glaucoma I share the opinions of the author regarding filtering operations. The urgency for survey here is much less than in glaucoma in older persons, because the sclera is not rigid. How ever I have done a trephine in a five-day-old infant whose comes was 16 mm in diameter Trephine openings in these young eyes heal over in a few months, but why not repeat them and leave the iris alone or do only an indotomy? There is less disfigurement and, possibly later, one of the holes will not heal completely There is no need to split the comea in buphthalmon. In reviewing my few cases, I take some comfort in Lloyd's remark that Verhoeff told him that he had never seen a case of bilateral buphthalmos in which both eyeballs were

In acute primary glaucoma of adults a twenty four-hour trial of intensive miotic therapy is indicated, but I have regretted longer delay of surgery A retrobulbar injection before operation will cause a substantial lowering of tension, and if aqueous is allowed to escape slowly, troublesome hemorrhage is unlikely to happen. A small keratome opening can be easily and safely enlarged with a probepointed keratome

In secondary glaucoma of a transitory nature I agree that intensive treatment of the underlying uveilts is needed, and welcome the cautious warnings of too vigorous foreign protein therapy I have the feeling that for some reason the optic nerve withstands the pressure of secondary glaucoma better than that of primary glaucoma. If the tension is not lower in a week, I would be tempted to try a 1½ mm trephine without splitting the cornea. The ris may not even prolapse. The permanent relief of tension exerts a favorable influence on the uveils. The severe after pain and the transitory relief of tension obtained with anterior claimber puncture, has made me abandon this procedure

No one should disagree with all that has been and about lacerations of the cychell. One is always tempted to try to save the cye, but few turn out well. When the laceration is entirely in the cornea and iris, and lens material has prolapsed through the corneal wound, a leukoma will result unless lens material is removed early from the anterior chamber

The author's preventive measures for detachment of the retina in removal of foreign bodies by the Posterior route answers the criticisms of this method. The number of intraceular foreign bodies has greatly decreased in my own practice because plants which send me work are all on high pressure safety goggle campaigns.

In lacerations through the lid margins one deep suture in the margin usually prevents notching if edges are exactly opposed. Avulsion of the lower lid at the inner canthus calls for one suture in the margin but the canthal ligament should be caught in this suture. If either of these marginal sutures correctly oppose the margins, other skin or con junctival sutures are of secondary importance. When the external ligament has been severed, it should be sutured back to the periosteum to prevent a depressed scar and shortening of the palpebral fissure The prompt repair of lid lacerations may tax your judgment and resourcefulness, but if anatomic relationships are nearly restored with minimal loss of tissue, later plastic repair seldom will be necessary One should never forget to include in his prognosis the possible loss of function of the levator muscle or the possibility of hidden runture of the globe, if they cannot be ruled out at once This may save untold embarrassment later sistent swelling of eyelids, following repair of lacera tions of evelids may indicate the presence of concealed runture of the globe or of a foreign body in the orbit. These foreign bodies have a tendency to extrude but as Dr Kirby has stated, the granulomatous infiltrations which they cause are very disturb-Probing with blunt forcers under the fluoroscope helped me once.

I believe that too much chemical cautery of corneal ulcers retards healing Most dendritio ulcers heal themselves if you can prevent secondary infection

In neuroparalytic keratitis make two intermarginal adhesions because one may not hold The same sutures may be used for thyrotoxic exophthalmos, but recession of the levator produces a very satisfactory result However, in thyrotrophic exophthalmos medical treatment is indicated and if the thyroid gland has been removed thyroid feeding is necessary. If this fails to stop progression of exophthalmos transfrontal orbital decompression is indicated We also know that some orbital tumors are best removed through the transfrontal approach. Subperiosteal orbital abscess needs more than drainage because it is often accompanied by osteomyelitis of the orbital bones and should be treated jointly by an eye surgeon and competent thinologic expert with much emphasis on the latter Chemotherapeutic drugs have altered this picture. but have not as yet replaced surgery

Dr James F Cahill, Syracuse—Dr Kirby has given an interesting, complete and comprehensive discourse on ophthalmic emergency procedures. In the discussion of his paper one can but agree with everything be has mentioned and it leaves only the description of the technic of some of the subjects which he did not have sufficient time to describe

It has been our experience that corneal wounds after excising any prolapsing iris heal more quickly and with a more even corneal surface if a fine corneal suture is used to close the wound. We have used a double-armed number 6 silk suture threaded through a fine corneal atraumatic needle of the suture is placed from within outward through the middle of the corneal wound halfway! between the anterior epithelial layer and Decemet s membrane and then emerging out through the epithelium as near the wound margin as possible. The other arm of the double-armed suture is placed in the same manner through the other lip of the wound The suture is then tied, care being used that the margins of the wound are not inverted or that the auture is not tied too tightly Sometimes a second suture has to be placed in the same manner, if the wound is too large to close with one suture erally, a conjunctival flap is then placed over the However, if the wound is small, no conjunctival flap is used and recovery is usually un-In all these cases tetanus antitoxin is eventful Daily treatment with penicillin, both locally to the injured eye and intramuscularly, is instituted for a week as a prophylactic measure

Intraocular foreign bodies have to be dealt with as No hard and fast rule can be separate problems given as to the mode of procedure in their removal Small recently imbedded foreign bodies can frequently be removed through the anterior route without causing any more trauma than has already Others, especially if large or of some been inflicted duration, although having entered the globe anteriorly are best removed through the posterior The foreign body should be removed as soon as possible because the longer it is in the eye, the more likely it may become enmeshed in connective tissue or exudate and resist the pull of the If the posterior route is selected, after localization with x-ray, the magnet should be placed as near to the piece of steel as possible so that it can be drawn near the surface of the eyeball Often the patient can tell when the foreign body is approaching the surface of the eyeball by the pull which is felt A sagittal incision is made down to the choroid coat as near as possible to the location of the foreign body, being sure to keep away from the danger zone of the charv body The magnet is then placed over the wound and when the steel fragment is drawn near the magnet, the black pigment will be seen protruding through the wound Plenty of time should be taken in the extraction of the foreign body as it may lie lengthwise across the wound, and by the continued application of the magnet, the foreign body will be gradually turned around and emerge through the wound easier and more quickly than if it is forced through in such a way that it will cause more of a wound than the one made with the Graefe knife

In making the wound down to the choroid only

one injury will be given to the retina and choroid and that will be by the emerging foreign body The wound is then cauterized and penicillin is given prophylactically for about one week The prognosis should be guarded because, even if the foreign body is removed, there may be a marked defect either in visual acuity or in the field, due to the evidate. hemorrhage, or even to detachment of the retina

In cases of absolute glaucoma when patients are reluctant to have an enucleation done, electro coagu lation of the sclera over the cilinry body may control the tension and pain Cyclodiathermy seemed to work especially well in a case of absolute glaucoma secondary to chronic iridocyclitis in a diabetic pa The tension is apt to rise following the operation and a paracentesis may have to be performed to control the tension for a short time im mediately following the operation. It has worked successfully in other cases of glaucoma. As in all procedures involving the ciliary region, sympathetiophthalmia has to be always kept in mind as Dr Kirby has emphasized

One other comment which might be mentioned if the discussion of hid wounds is that they be deal with by an ophthalmologist, or, at least supervise In general hospitals where one is apt to encounter various types of accidental injuries, the are usually seen first by either the house surgeon o intern who may have had little or no ophthalmi Where the ultimate result depends a much on the initial repair, we think it is imperativ that it be done by one who is familiar with thes structures The right thing, done carefully and with deliberation soon after the accident, may save the patient time and discomfort of plastic repair at i later date

A M A JOINS WORLD MEDICAL ASSOCIATION

The American Medical Association, by action of the Board of Trugtees at its last meeting, has, become a member of the "World Medical Association"—an organization which will promote the interchange of medical information among the medical associations of the world, according to an editorial in the October 26 issue of the JAMA

The editorial follows in part
"At the end of September a conference met in London in which there were medical representatives of twenty-one European countries and ten countries outside Europe and at which the American Medical Association was represented by several observers appointed by the Board of Trustees The meeting was held under the joint auspices of the British Medical Association, whose president, Sir Hugh Lett, presided, and the Association Professionelle Internationale des Médecins The latter organization was an assemblage which was constituted before the war to give opportunity for interchange o medical information among the medical association of the world regarding mutually interesting prob

"The new conference agreed unanimously tha an international organization of medical association should be established and should limit itself to mat ters of medical practice and social medicine French, Belgian, Greek, and Dutch delegates indi cated that every country had its academies for promotion of medical science and that the immediate need was for an organization to defend the rights o the ordinary practitioner, especially in view of legis lation passed in many countries Dr T C Routley representing the Canadian Medical Association, in dicated the desirability of an agency whereby the World Health Organization and UNESCO could make contacts with the medical associations of vari ous countries "

INTOCOSTRIN IN THE TREATMENT OF ACUTE ANTERIOR POLIOMYELITIS

NICHOLAS S RANSOHOTT BS, MD New York City

(From the Monmouth Memorial Hospital Long Branch, \em Jerney)

THE preliminary report of the treatment of acute anterior polionychits with intocestrin was published in the Journal of the American Medical Association, September 8, 1045

The present paper is the second preliminary report, preliminary only because some of the pa itents were not treated with what is now known to be the optimum therapoutic desage of the drug

In both reports it is stated that no curative effect from intocostrin is either expected or claimed. However, the results of treatment of acute anterior poliomyelitis by intocostrin and intensive physical therapy have been most gratifying

Twenty nine patients with acute anterior poliomyclitis have been treated by thus method at the Monmouth Memorial Hospital in Long Branch, New Jersey, during 1945 There is not a single fixed deformity There are no contrac tures, scoloses, or pelvic obliquities. No braces or crutches are being used. Three patients walk with the aid of a cane. Nineteen patients show excellent results They have no residual paralysis nor weakness. Five patients show very good results. They have minimal weakness in one or two muscles Three patients show good results They have paralysis in isolated muscles. One patient shows a poor result. She has extensive paralysis and is not yet ambulatory, but is now learning to walk in a walker A single fatality occurred early in the series before the optimum decage of intocostrin had been determined This death was due partially to the mechanical failure of the respirator and occurred nineteen hours after the administration of intocostrin

In 1942 Dr R. Plato Schwarts proved with the electromyograph, that there was spasm in acute anterior pollomyelitis. In 1944 he presented patients whom he had treated with crystroidine a depressant of skeletal muscle. This together with the effect of curare in the treatment of spastic cerebral palsy, made it seem logical to use intocostrin in the treatment of acute anterior pollomyelltis.

Intocostron is a pharmacologically stable stand ardized preparation of curare—It is thought that curare acts on the muscle end-organs by impeding the action of acetyl choline—It is important to emphasize and re-emphasize the fact that in-

tocostrin, intelligently administered is a thoroughly safe drug to use. In over two thousand injections of intocostrin that have been given to patients with acute anterior poliomyelitis at the Monmouth Memorial Hospital, it has never been necessary to use its pharmacologic antidote prostiemine.

The desage is 0.9 unit per kilo of body weight every eight hours for the first twenty four hours. If there is no adverse reaction, and there never has been the desage is then increased to 1.5 units per kilo of body weight every eight hours. The drug is injected intramuseularly. This desage is maintained until all evidence of muscle spasm has disappeared. The intecestral is then stopped for three days. These cases are checked daily. If there is recurrence of spasm, intocestral therapy is resumed.

Within three to five minutes after the administration of intocostrin, most patients complain of either blurred or double vision. Within fifteen to twenty minutes whatever pain has been present is relieved.

It is advisable now to review briefly electrophysiology of muscles in order to follow the rationale for the use of curaro, the determination of desage, and the type of physical therapy utilized in the treatment

Our knowledge of electrophysiology has been enhanced by a most sensitive electromyograph designed by Dr Charles Berry By utilizing this equipment, it was possible to see and to photograph for permanent record, the difference between a normal muscle, a poliomyelitic muscle, and the effect of intocostrin on each

A normal muscle at physiologic rest shows no measurable action potential, or in other words no electric currents can be detected. Any electric current in a muscle is called action potential. Only during activity will the muscle tissue display certain electric phenomena.

A pollomyclitic muscle during disease activity is rurely at physiologic rest for electrical potentials can be detected

It is important for us, as clinicians, to appreciate that there is a difference electronically between physiologic rest and clinical rest. For example if a normal individual is lying down at rest, he will show no electric activity in the nuscles and exemplifies both clinical and physiologic rest. On the other hand if an individual in the acute stage of anterior politonyelitis is lying

Presented before the 140th Annual Meeting of the Medical Society of the State of New York Section on Orthopedi Surgery May 2 1946

down, apparently at rest, he will show electric activity in the muscles—Clinically, he is at rest but, physiologically, he is not at rest

On voluntary contraction, a normal muscle will display electric currents which are seen on the myograph as relatively regular in frequency and potential In acute anterior poliomyelitis, on voluntary contraction, the frequencies and potentials are irregular The strength of the contraction is less than normal, as shown by an image which is smaller than the relatively normal With intocostrin, these irregularities in frequency and potentiality are diminished or eliminated size of the image becomes greater Therefore, we are now approaching the normal The increase in the height of the image shows definite increase in muscle power upon attempts at voluntary contraction

Irrespective of whether the pathology of acute anterior poliomyelitis is in the peripheral structures, myoneural junctions, or spinal cord, anyone who has seen a moderate number of patients, either must have seen deformities develop or have had a difficult time preventing them. These observations make it imperative that muscle length be maintained throughout the body. Loss of muscle length indicates spasm. All of our physical therapy procedures have had this as their basis.

At three separate intervals during the first three hours following the daytime doses of intocostrin, every joint in the body is put through a complete range of motion or as nearly a complete range of motion as is possible at the time. All the muscles of the extremities, back, and neck are stretched in an endeavor to re-establish normal muscle length This stretching, of course, must be done with intelligence but pain is not the criterion of the amount of stretching necessary at any particular time It is difficult to describe just what stretching is required but, suffice it to say. it is necessary to hurt the patient in order to reestablish normal muscle physiology ing cruelty is compensated for by the comfort and relaxation which it engenders

The statement, "to re-establish normal muscle physiology by physical therapy," is substantiated by myographic studies. With muscle spasm, there is a loss of muscle length and this must be overcome by muscle stretching. This stretching of muscles, which show action potentials, causes the abnormal potentials to disappear for about a half hour without intocostrin, and for about five hours with intocostrin.

Exercises are usually started within twentyfour hours of admission. The exercises used are a combination of the technics of Elizabeth Wright, Niels Bukh, Skaarstrom, and Bode. Every attempt is made to re-establish function as early as possible While it is the endeavor of the physical therapy department to make the muscles perform their normal functions, substitution muscle action is not eschewed Patients are made ambulatory as soon as possible Elbow crutches or walkers are used if necessary No attempt is made to avoid physical tiredness or fatigue Quite the contrary! Each individual case presents an individual problem, and at no time do we permit the occurrence of pliysical stagnation The patients continue to work under instruction during the hours that they are not stretched They exercise together, use parallel bars, the Hubbard tank, rolling pins, specially constructed chairs, trapezes fastened to the foot of the beds, the manner's wheel, the breycle, and many other contri ances

In addition to this, occupational therapy prescribed for each patient, the type depending upon the muscular involvement. The patient are kept busy continuously. This regimen, addition to being efficacious in the treatment the neuromuscular involvement, has proved me beneficial in keeping the patients happy.

Progress is recorded by weekly muscle tes just prior to the administration of intocostrin, which time the effect of the drug is at its mir mum

Let us now review briefly the patien under discussion in order to determine the time required to achieve results. In the group of : patients, marked excellent, the majority were o of bed twenty-fours hours after admission, regar less of temperatures, having received one to tr doses of intocostrin Those who continued show spasm were kept on intocostrin until th spasm had disappeared The 5 patients mark as having very good results were out of bed at walking as early as one to two weeks after the o set of the disease, although they had some paral sis at that time The 3 patients marked as got results were able to walk in a walker or with har crutches as early as one month after the onse One month later, they were capable of getting of of bed without assistance At the present tim they are able to walk alone but continue to car a cane for safety's sake

There were 5 patients with bulbar involvement and their response to adequate dosage of intoce trin was most startling. Relief was obtained dute to the relavation of the spasm of the accessor muscles of respiration, the diaphragm, or bot The swallowing difficulties responded immediately and dramatically to the drug.

Summary

Twenty-nine cases of acute anterior polymyelitis have been treated during 1945 at the Monmouth Memorial Hospital in Long Branci

New Jersey The patients have been treated with intocestrin and physical therapy

The new of intocostrin has enabled immediate remedial exercises by reducing muscle spasm chically action potentials electronically and by controlling pain

Adequate desage of intocestrin has been presented and no reactions with this desage have been encountered in over two thousand injections.

Physical therapeutic manipulations and ever cises are aimed at rapid re-establishment of full joint motion and prevention of deformatics

The electromyograph has been most helpful in the process of determining the optimized design of interestria and evaluating this treatment. This equipment, while desirable is not essential in the treatment as it has been described.

Conclusions

A method of treating acute anterior poliomyelitis has been described which has given bet ter results more simply more rapidly, and less expensively than any method previously used at the Monmouth Memorial Hospital

The 29 patients treated have no deformities continutures, pelvic obliquities, or binees. Nince teen patients have excellent return of all muscle power. 5 patients have very good return of muscle power, 3 patients have good return of muscle power, 1 patient has poor return of muscle power and there was I fatality.

The period of disability and hospitalization has

been drastically reduced

It has been shown that intocostrin is a thor oughly safe medication and clinically gives the desired results.

A new adaptation of old physical therapy technics has been described and has proved effications.

No claim is made that this method is a cure

Note: Thanks are due to Drs. Newcomer and Burke for their cooperation and encouragement.

1100 PARK AVENUE

Discussion

Dr Frederick Thompson, New 1 ork Cuty—Dr Ransohoff speaks very glibly about the tracings made by lus myograph. I must admit that I am still a bit confused over the intricacies of this mar velous testing machine. I am sure that many in the audience feel the same confusion that I do in reading these graphs. I have visited the Momouth Memorial Hospital where the electromyograph is used and after seeing it in action, I believe it to be a very valuable instrument both from the choiced and the physiotherapeutic standpoint of the care of polifomyohtis It is a machino which is a very sensitive index of the electrical potential present in the muscle It is infinitely more sensitive than the eleverest examining hand. It has many values. Primarily, it indicates when the pollomyelitis has subsided enough under both curare and stretching exercises for the child asfely to go home. Second it serves as an early diagnostic index of the recurrence of muscle

This can be told before the examining hand can determine this point. Above all it is not too complicated for technicians or even doctors to learn and even operate. I believe that saide from its use in other spastic diseases, its value in poliomyelitis alone probably will make it a necessary standard equipment in most orthopodic hospitals.

I would like to ask Dr Ransohoff if the electromyograph is capable of foretelling the future and if it can determine whether a muscle afflicted with paralysis will show some return of power or whether it can definitely determine whether a marked return of power will finally result. I would like to know, also, what, if any effect the use of hot packs alone has in diminishing the irregularly electrical potential tracings on his electromyograph. What is the effect of hot packs plus stretching of the muscle on this electrical potential tracings on the selectromy of the muscle on this electrical potential tracings.

His use of curare it seems to me is of great value in that it can be used generally by physicians every where throughout the country It has the advantage

of an immediate means of therapy

It is mexpensive compared to the cost of special nurses in constant attendance upon the child administering hot packs and other forms of physiotherapy. It allows one nurse to handle many cases of infantile paralysis and the dose can be so timed that one physiotherapist can institute stretching of many childrens muscles after the curare is administered.

Dr Ranschoff (closing)—It is, unfortunately impossible to absorb or present the whole story of electromyography in a presentation such as this The muscle action currents in pollomyelitis vary in both frequencies and potentials from the relatively normal pattern. This is explained in detail in the body of the paper. I agree with Dr. Thompson that the electromyograph will become just as important to clinicians as the electrocardi ograph has become in studying the electric current generated in the heart, not only in the study of acute anterior pollomyelitis, but other neuronuscular disorders as well. In our study it has been an invaluable aid.

We have, as yet, not had sufficient experience with the electromyograph to be able to tell whether or not it can indicate the future of an afflicted muscle but certainly the return of muscle power in a recovering muscle is very clearly traceable on the cathode-ray screen. The effects of hot packs or hot packs plus stretching has not been studied on the my ograph

OSTEOCHONDRITIS OF CERVICAL SPINE AND PARALYSIS OF ALL FOUR EXTREMITIES

SAMUEL W BOORSTEIN, MD, FACS, New York City

(I rom the Orthopedic Service of the Bronx Hospital)

CASES of osteochondritis or, as it is called in the new terminology, osteochondrosis of the spine still present difficulties in diagnosis. Many are erroneously called compression (crush) fractures of spine and even more are mistaken for tuberculosis. While no harm is done in immobilizing the spine as for tuberculosis, the immobilization in cases of osteochondrosis must be discontinued very much earlier. It is necessary to establish a correct picture of the symptoms, even the rare symptoms, so that methods of proper differential diagnosis may be established and the proper treatments instituted at the earliest possible moment.

The case presented here is one which I diagnosed as osteochondrosis of the spine—I do not recall encountering in the literature a case of paralysis in osteochondrosis—Even paralysis of tubercular origin could not have been made so speedy and so perfect a recovery

Report of Case

Edrena T, colored, age twelve and a half, was admitted to the Bronx Hospital on May 3, 1944 The cluef complaints on admission were loss of power in the left upper and lower extremities for three weeks prior to admission

Previous History —She had had the usual children's diseases and had not menstruated as yet

Present Illness—Three weeks before admission, while carrying a glass of water, her left leg began to drag suddenly and she dropped the glass from her left hand. She did not lose consciousness at that time nor had she felt any weakness. She gave no history of trauma. The weakness in the left upper and lower extremities did not change in those three weeks. She came to the pediatric clinic of the Bronx Hospital on April 26, 1944, i.e., two weeks after the initial symptoms.

Physical examination at that time showed dragging of the left leg and awkwardness of motion of the left hand as evidenced by dropping of articles

The patient was admitted to the neurologic service of Dr Dattner on May 3, 1944 The findings were left hemiplegia with ankle clonus, Babinski, and increased reflexes, and spastic gait

The tonsils were large and one enlarged lymph node was noted on the left side of neck

The provisional diagnosis was (1) vascular disease, or (2) encephalitis

A spinal tap was done on May 4, initial pressure was 29 cm. The fluid was clear and nonopalescent

Presented at the 140th Annual Meeting of the Medical Society of the State of New York, Section on Orthopedic Surgery May 3 1946 After removal of 8 to 10 cc of fluid, pressure went down to 12 cm which is about normal Laboratory test of fluid showed normal contents

X-ray of chest and skull was normal with no en

Another examination by a neurologist a week later showed progression of the paralysis of the hand and foot. Spinal tap on May 22 showed initial pressure of 12 cm. After removal of 10 cc., pressure fell to 8 cm. Laboratory examination of fluid revealed normal contents.

Progress—The patient was kept in bed, the temperature was normal and she was apparently comfortable until May 24, i.e., twenty days after admission when she complained of weakness of the right hand. On the same day she began for the first time to complain of pain and stiffness of the neck, weakness of the right upper and lower extremities, though not to the same extent as the left. A lesion at the cervical spine was considered.

The x-ray of the cervical spine taken on May 27, 1944 was reported as follows "There is complete destruction and wedging of the fifth cervical The fourth cervical is dislocated over the sixth cervical The disks are normal There is slight new bone growth with some enlargement of soft tissue, suspicious of an abscess"

The diagnosis was tuberculosis or neoplasm

I saw the patient on May 27, 1944, and my notes were as follows. The patient does not hold the cervical spine stiff. Neck is straight. No gibbus present. Flexion and extension of the cervical spine is almost 50 per cent of normal. Only slight pain is felt on jarring. The patient states that she has had only occasional pain at night. My provisional diagnosis was osteochondrosis of the cervical spine.

The reason for ruling out tuberculosis of the spine was that while tuberculosis of the joints is common among the colored people, pain would have been present for some time prior to the paralysis. Even at the time of my examination, six weeks after the onset of the paralysis, she had very little pain. Pain at night which is so common in tuberculosis was almost entirely absent. The motion of the cervical spine was not greatly limited in this case.

In tuberculosis, the \-ray would show more of a wedge-shaped vertebra and some destruction of the vertebrae above and below with narrowing of the disks. In this case the body was collapsed and al most entirely disappeared, like a thin piece of paper. The disks were normal. According to George and Leonard, Caffey, deLorimer, and Archer, the narrowing of disks is always a concomitant of tuberculosis and quite frequently the earliest roentgen manifestation.

Brailsford⁵ claims that in tuberculosis "when the lesion has involved a large proportion of the vertebral body, the radiograph will show a 'stippled' appearance of the bone probably due to small necrotic

hone fragments and irregularity due to crosion of the outline of the body which is gradually crushed between the vertebrae above and below.

I advised application of a felt Thomas collar until a diagnosis could be reached

Results of the additional laboratory tests were usine and blood normal—the Wassermann and Kalin tests negative—The tuberculin test was negative

A neurologic surgeon advised against decompresion as the diagnosis was not then clearly established life stated that over if the diagnosis were already established, the laminectomy would be of doubtful value as the dislocation was still present. His say gettion was reduction by orthopedic methods.

The patient was transferred to the Orthopedic Dapartment on June 2—seven weeks after the onset of the symptoms. The felt collar had been on for six days. It was taken off for examination and it was found that the motions of the neck were free in all directions even to flexion and extension. Traction was applied by Eayer's suspension apparatus beginning with seven pounds. The head was held in hyper xtension by means of a felt collar and a folded sheet under the neck. The patient stood the traction well in three days she told us that there was some improvement in the finger motion as she was able to touch the other fingers with her thumb

X-ray taken on June 7 five days after the application of traction, showed some improvement of dis-

location with some bone production

The radiotherapist on June 21 expressed doubt as to whether a malignancy was present but felt that we were dealing with a neurogenic tumor either neurofibroma or neoplasm of the sympathetic nerves the agreed with the suggestion that x ray treatment be administered with the cast windowed to permit treatment. He suggested that 200 r units three times weekly be the doses at the beginning

On June 20 a Thomas plaster collar with the neck in hyperextension hanging over the edge of the table was applied. Patient had no discomfort during the manipulation and assisted whenever sik was ordered to move or hold the neck still. Reaction of the patient at this time made me feel more convinced that the case was neither tubercular nor malignant and that we were dealing with a noninflammatory condition probably an esteochondrosis

A ray taken on June 28 two days after application of the plaster showed improvement in the position of the dislocation

On July 1 the patient sat up in bed

On July 2 one month after the application of the traction the patient reported that she felt marked improvement in the power of the upper extremities and that she was able to put them behind her neck She was able to feed herself and began to walk around the ward with the aid of a walker. On that day windows were cut in the east for x ray therapy. The improvement continued, the power in the hands increased, so that on August 28 the patient was per nitted to use crutches for walking and physiother may was instituted. She still had Babinski positive

A ray taken on Soptember 6, 1914 still showed dislocation of the fourth cervical or sixth cervical with absorption of the fifth cervical. Some bridging was beginning between the fourth cervical and sixth or raical.

The patient meanwhile had been receiving x-ray therapy. I rom July 20 to veptemby 12 she had had 3 000 r units and then treatments were stopped on September 11 a new Thomas collar was applied ance, no more x-ray treatments were to be given

On September 15, 1944, the patient was discharged from the hospital wearing the cast—she was referred to the clinic for further treatments and a cervical brace was ordered. She received the brace in December 1914.

\times ray taken on December 8, 1944 showed the dislocation still present but the destroyed bone showed more density. There was more bone production and bridging of the bodies. The abscess or soft tissue seemed to be calcified.

Further Progress—The child came somewhat irregularly for treatments but did wear the brace continually. She returned to school in November 1944 and was put in a class for physically handicannocd children.

On September 7 1045 she reported that she had no pain. She could use the upper extramities freely for all kinds of work even to serul the floor or carry packages. She could walk as much as she cared to even up the stairs. By that time she attended the regular classes in high school with no special privilegal.

Physical Progress — The spine clowed by & formity had normal motion and good power = 1.2 the extremities.

V-ray taken on August 12 1945 showed ruplete absorption of the fifth corneal with occasionable amount of new bone ankyloging the upper arrivately rapidly and the state of the

She was advised to discontinue the brace 1. / Fig.

Final Examination on April 10 194 — Leading activities were the same as in September 1 There were no deviation of the head not a facies and no deformity nor prominent posteriorly. There was no tenderme of tension lateral motion and rotation pain on jarring. Motor power in the was good. She walked without a first was good. She walked without a first was good. There was no Babinski, or the facility of the points.

Discussion

The patient made a rapid recommended doubtful whether the spine could have responded to the treatments

The x ray showed the difference and osteochondross and osteochondross and osteochondross and osteochondross the spacing of the state of

The x ray therapy strong evidently helped to professed ankylosis by relicions that

Throughout her stay in the hospital and in the followup in the outpatient department, the patient was frequently examined by the neurologist and the neurologic surgeon. Their reports as to the improvements agreed with ours

THE RESULTS OF TREATMENT OF LYMPHOSARCOMA

ARTHUR PURDY STOUT, M D, New York City

(From the Surgical Pathology Laboratory of the College of Physicians and Surgeons, Columbia University, and the Department of Surgery, Presbyterian Hospital)

IN 1942 the writer published a paper entitled "Is Lymphosarcoma Curable?" in which a group of treated and untreated cases of lymphosarcoma was studied from the point of view of survival and cure at five- and ten-year periods. It was found that although I patient survived ten years without treatment before dying of his disease, 7 treated patients survived ten years, and 6 of them remained without evidence of lymphosarcom: These were all individuals in whom the tumor was still relatively localized when treatment was given

The number of cases seen more than ten years before, however, was relatively small, 48 treated and 42 untreated, and the impression still exists in many quarters that even ten years is not a sufficient length of time to be sure that the disease may not reappear once more. Consequently, it was felt that a reinvestigation of the subject might be illuminating because there would now be more patients and a longer period of time for some of the survivors in the group formerly reported.

Before reporting the results, it seems necessary once more to describe the criteria used in diagnosing lymphosarcoma and applying names for the different varieties since contradictions in the use of terms still persist There are three main varieties of lymphosaicoma These are generally called lymphocytic, reticulum cell, and follicular or giant follicle But the histologic interpretation is extremely confused as can be learned from a study of the papers of Foot, Gall and Mallory 2 3 Robb-Smith, 4 Sugarbaker and Craver, 5 Symmers, ⁶ and Warren and Picena ⁷ The difficulty comes from an incomplete understanding of the cells found in lymphoid tissue, particularly the cells of the germinal centers of the follicles This has led many of the above writers to use names for cells which are at complete variance so that the bewildered reader needs a glossary constantly at hand to understand what they are talking about To cite a single example large cell lymphosarcoma, which is commonly designated reticulum cell sarcoma, is called large round cell sarcoma by Symmers, Mallory have two names stem cell and clasmatocytic cell lymphosarcoma, Foot uses both reticulum cell and Roulet's retothehal cell.8 Robb-Smith uses the term reticulosarcoma which he got from Oberling and subclassifies

Presented at the 140th Annual Meeting of the Medical Society of the State of New York Section on Pathology and Chinical Pathology May 1 1046

this into diffuse and trabecular undifferentiated reticulosarcoma, dictvo-syncytial syncytial (fibrillo-syncytial) and dictyocytic (fibrillary) reticulosarcoma, polymorphic reticulosarcoma. reticulo-endotheliosarcoma, and histiocytoma Reference to the paper by Gery and Bableto will yield a great many more names used by them selves and others Moreover, Sugarbaker and Craver, who use the term reticulum cell lymphosarcoma, state that 94 per cent of all their lymphoid tumors were of this variety, while Warren and Picena use it for only 36 per cent of their The writer encouraged Dr M R large series Murray to investigate these tumors by the method of tissue culture in the hope that it might yield information about the origin and nature of the various tumor cells but without success, because, unlike other tumors, the cells of the lymphosarcomas only wander out into the surrounding media but do not multiply to form a definite "tissue" Faced with such a confusion of terms, the writer, therefore, still adheres to the unscientific, inexact classification which he used before, 1e, those lymphosarcomas with cells having a diameter less than twice that of a normal lymphocyte are called arbitrarily lymphocytic cell lymphosarcoma, while those with cells larger than this are called reticulum cell lymphosar-In both of these, the architecture of the node is obliterated and the space inside the capsule solidly filled with tumor cells

The grant follicle lymphosarcomas as the name implies are characterized by a rather general enlargement of the lymphoid follicles to sizes greater than usually found in simple hyperplasia But there is need for subdivision of these because the cells forming the follicles can differ in appearance and nature, and this difference is reflected in their degree of malignancy variety the follicles closely resemble normal ones, but are of enormous size, distributed throughout the entire node and may have an admixture of isolated reticulum cells scattered among the cells of the germinal center Such lesions Robb-Smith calls lymphoid follicular reticuloses, or giant cell fibrillary follicular reticuloses He regards the lesion as the one described by Brill, Baehr, and Rosenthal¹⁰ and feels that it is benign, although acknowledging that it may undergo blastomatous change and develop lymphoid leukenna Others, including Baehr and Klemperer, 11 regard it as malignant Of the cases

studied here 50 per cent died eventually of the disease which is a sufficient mortality to warrant the belief that it should be considered as a form of lymphosarcoma

In a second variety mant follicles are formed which are not composed of the usual follicle cells but of lymphoblasts or larger reticuloblasts and frequently, the follicles are incomplete so that their component cells extend outward diffusely from the periphery of the follicle and at such places the appearance will simulate that of the lymphocytic or reticulum cell tumor Smith calls such tumors follicular lymphoblastic reticulosarcomas and recognizes them as fully malignant Symmers also recognized this variety and pointed out that in addition to lymphosir coma and leukemia, the disease might terminate as Hodgkin's disease In any event this variety of less differentiated followlar lymphosarconn is more serious and fatal than the differentiated form with a five year cure rate of only 26 3 per cent, or half that of the former

There have been no essential changes in the opinions expressed in the former paper about the biologic characteristics of lymphosurcomas but it will be of value to resterate them here. The lymphosarcomus generally run a rapid and fatal course, but there are a few of them which are sion and deliberate in their progress. These last may have a single focal origin instead of many and furnish the majority of the cases with long survival after treatment. Most of the long sur vivals have primary tumors in the oral cavity tonal nasopharynx salivary glands and gastrointestinal tract It is possible that this statement may also apply to the skin and orbit but accurate information about this is lacking Lymphosarcoma starting in childhood or complicated by leukemia, is almost invariably fatal

In this paper so-called reticulum cell tumors of the bone marron have been excluded. Gall

and Mullory and Sautu and Hsich is reject them as forms of Lwing tumor and include them with the lymphosarcomas—Chiefly because these bone marrow tumors are clinically indistinguishable from Lwing tumors. I have preferred to regard them as various of that tumor form and have excluded them here—Our records do not include any cures of reticulum cell tumors of bone marrow.

The material used in this study consists of a group of 170 cuses of lymphosarioms with microscopic confirmation of the diagnosis. For 110 of these some form of curative therapy was attempted while for the remaining 51 either curative therapy was not given or it is unknown whether or not it was used. In the evaluation of results all cases have been counted as failures unless their symptom free survival is known, so that those who died in less than ten years, were lost not followed, or were last seen alive with tumor persisting have been grouped together, to be contrasted with symptom free survivals.

In Table 1 the pertinent features of the results of treated and untreated cases are shown The primary site can sometimes be ascertained with reasonable accuracy but probably more of these patients actually had generalized lymphosarcoma when first seen than is indicated. Perhaps the most striking feature of the chart is the very great difference in ten year cure rate between those cases which start in lymph nodes and spleen and those which are primary elsewhere For the lymph nodes only 6 of 83 treated patients or 7.2 per cent were symptom free at ten years while 9 of 35 patients or 25 7 per cent, with tumors primary elsewhere were well over ten years after treatment I believe that absence of any cures in the skin and orbit may be misleading and may be due to the fact that most of the cases were not McGavic12 made a determined effort to trace the fate of 20 cases of orbital, bulbar

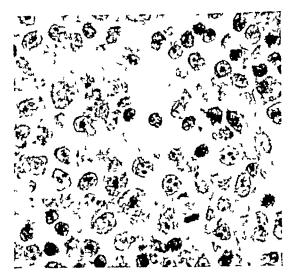

Fig 1 Photomicrograph of characteristic reticulum cell lymphosarcoma

and palpebral lymphosarcomas seen at the Institute of Ophthalmology of Columbia University and at the Memorial Hospital in New York, but obtained indecisive results died or were alive with tumor, the rest were symptom-free, 5 less than five years, 4 over five years but less than ten years and 1 for eighteen years This last patient was the only one treated more than ten years before the report, consequently, it is of no value statistically for the longer period The cure rate at five years for 10 patients treated more than five years before was Experience with lymphosarcomas 50 per cent of other regions indicates that this figure will not be more than halved at ten years and may even remain unchanged so that it is probably justifiable to predict a ten-year cure rate between 25 and 50 per cent for lymphosarcomas of the eye, orbit, and lids

When one attempts to compare the various groups of lymph nodes, the numbers are so small and the possible variables so great that the differences in results are probably without significance. What does seem real and important is a comparison of treated with untreated patients.

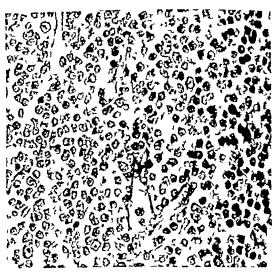

Fig 2 Photomicrograph of characteristic lymphe cytic lymphosarcoma

At five years 23 5 per cent of the treated patient survived and 15 per cent were symptom-free while only 2 per cent of the untreated patient survived and none was free from disease A ten years 134 per cent of treated patients su vived and 12 7 per cent were symptom-free, whi of the untreated ones none survived Even gran ing the fact that most of the untreated patient were far advanced and beyond hope anyway, th difference is striking. One of the 2 long surviv. cases was a Christian Scientist, who permitte exploration and biopsy of a retroperatoneal giar follicle lymphosicoma but no other therapeut She lived seven years, finally dying (measures generalization of the tumor Another male p tient was known to have had a swelling in the n guinal region for nine years before this was ecised and proved to be a lymphocytic cell lymphi sarcoma At this time he was treated by roentge therapy for generalized lymph adenopathy an survived five more years before dying of the disease

In Table 2 is shown a comparison of surviviates for the three different histologic types (lymphosarcoma When a similar analysis of the

Blopsy of three submaxillary nodes the largest of which was 3 cm. in diameter, followed by roentgentherapy. No recurrence after 104 months. Low magnification to show the huge sharply defined follicles and dis appearance of sinuses.

material was made four years ago, based upon a five-year follow up, the figures suggested that the reticulum cell lymphosarcona was the least favorable type with lymphosytic cell tumors slightly more favorable, while the giant follicle tumors showed the largest percentage of cures. The present study indicates that there is no executial difference between the reticulum and lymphocytic cell tumors while the giant follicle tumors still maintain a slight statistic advantage.

It has already been pointed out that one can subdivide the giant follicle tumors into (a) those which are well differentiated with follicles which are greatly enlarged and more numerous but not otherwise distinguishable from non neoplastic ones, and (b) an undifferentiated form with either incompletely formed follicles merging into areas of lympho- or reticuloblasts or follicles formed of these cells instead of normal germinal center cells. There were not enough of these tumors to study statistically over a ten-year period was necessary, therefore, to take a group of 31 patients treated more than five years ago Table 3 shows a 25 per cent difference between the two half of the well-differentiated tumors were symptom-free at five years while only a quarter of the incompletely differentiated ones were equally

Fig 4 Detail of Fig 1 showing the cellular composition of one of the follules.

fortunate Three treated grant follicle lymphosarcomas remain well more than ten years Two of these were differentiated and one an incompletely differentiated lymphocytic cell tumor

The nature of the treatment used to achieve these happy results is a matter of interest. While the majority of writers favor roentgen therapy as the treatment of choice. Gall' has recently challenged this by reporting upon 39 cases of lymphosarcoma treated in fifteen instances by surgery alone, while in the remainder, excision was supplemented by prophylactic radiotherapy or radiotherapy for recurrences Gall' claums that the postoperative survival rate for these cases was significantly longer than for cases treated by radiotherapy alone Five of these nationts had passed the ten-year mark, but only 2 remained without any evidence of recurrence None of the long survival cases had been primary ın lymph nodes

It is impossible to compare this experience with our own, for it is not stated how many of the cases were treated ten or more years before the study was made. The report does not convince me that valid evidence has been presented that surgery with or without postoperative radiotherapy results in more cures and greater prolongation of life than radiotherapy alone.

used in 16 cases of lymphosarcoma known to have survived more than ten years after treatment. This shows that of the 15 patients who remain symptom-free, 7 were treated by radiotherapy alone, 3 by surgery alone, and 5 by surgery followed by radiotherapy. It has seemed to me of no value to construct a table showing percentages based upon the number of patients treated by each of those three methods. I accept the figures as indicating that long survivals occur occasionally following treatment by each of the three methods. Apparently, surgery alone succeeds only when the lesion is limited to a single locus which can be completely excised. Theoretically,

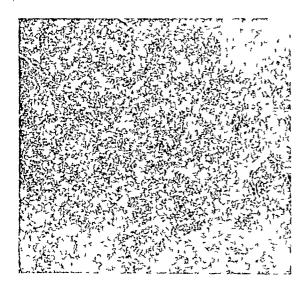

Fig 5 Partly differentiated lymphocytic cell giant follicle lymphosarcoma Male 36 years old with enlarged cervical nodes to 3 × 2 cm Treated by biopsy and roentgentherapy A year later axillary nodes enlarged and were treated by x-ray No recurrence 109 months after first treatment Low magnification to show many follicles of varied size and definition with disappearance of sinuses

radiotherapy alone, or after surgery, can succeed when more than one contiguous areas are mvolved, such as, for instance, the tonsil and cervical nodes For this reason it would seem to me to be wise always to supplement excision by prophylactic postoperative radiotherapy if surgery has been the primary form of treatment used No doubt surgery will continue to be used for tumors primary in the gastrointestinal tract because of the difficulty of distinguishing between lymphosarcoma and the far more common carci noma which is best treated by resection Aside from this, I can find no good reason for preferring surgery to radiotherapy in treatment, although it should always be employed for biopsy without which intelligent treatment cannot be carried out

Finally, comes the question, can these long survival symptom-free cases be considered absolute cures? Technically, the answer is no,

Fig 6 Detail of Fig 3 showing that the follides and the tissue outside of them are both composed of lymphoblasts with greater condensation and layering in the follicles

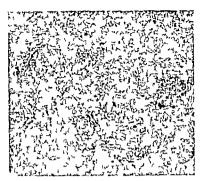

Fig 7 Partly differentiated reticulum cell giant follide lymphosarcoma of cervical lymph node. Female 35 years old with two-year history of en largment of cervical nodes and spleen. Biopsy of cervical node followed by heffective palliative roent-gentherapy. Later involvement of colon and rectum by lymphosytic cell lymphosarcoma. Died 10 months after biopsy. Vague enlarged follicles of inditatine outlines merging into diffuse involvement.

since it is unknown whether or not they are actually free from dormant tumor cells which may start to grow at some later date. One has to consider this possibility, since delayed tumor reappearance is accepted as an occasional occurrence.

Actually and from a practical standpoint, an extension of life of from ten to fifteen years for patients of sixty years fulfills for them their life expectancy Since, without treatment there is no reason to suppose they could have lived so long they are certainly potential cures, and I believe it is proper to antique ate that most of them are actual cures. It seems to me that this is an important conception to grasp and that it should replace the attitude formerly assumed by the majority of physicians and pathologists, encouraged by the statements of Minot and Isaacs 14 Designation, 15 and Krumbhaar 15 that the disease is incurable. It is not a systemic disease but one which starts from a focus, if recognized and treated while still in the focal stage, it can be cradicated

At the present time few cases are recognized and treated while still in this focal stage, partly because of the prevalent defeatist attitude of physicians and partly because of their reluctance to subject patients to biopsy. If these two fundamental errors are corrected, I shall anticipate an improvement in the ten year cure rate of lymphosarcoma.

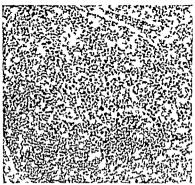

Fig. 8. Detail of Fig. 5 to show merging of reticulum tumor cells in follicle with stroma.

Summary

Lymphosarcoma is a form of neoplasm which derives from the lymphoid and reticulo-endothelial cells. It commences in a focal area or group of nodes and can be divided roughly into three histologic types called reticulum cell, lymphocytic cell, and giant follide lymphosarcoma. In most cases it spreads rapidly to involve more than one area, but occasionally progress is slow and it remains localized for a considerable period of time

It is these cases which are most favorable for treatment Rarely, it is a single group of lymph nodes which is involved. More commonly the oral cavity, pharynx orbit, and gastro-intestinal tract provide the original focus. In a study of 119 cases of lymphosarcoma treated more than ten years ago, it is heartening to be able to report 12.7 per cent of them symptom-free after more than ten years.

The site of origin was of importance—the rate for 83 lymph node cases was only 7.2 per cent. while 35 cases with the primary focus elsewhere showed 25 7 per cent symptom free after more than ten years There were examples of all three histologic types among the 15 symptom free survivals, 7 were treated by radiotherapy alone, 3 by surgery alone and 5 by surgery followed by radiotherapy Since success depends upon eradication or destruction of the tumor while it is still focal physicians should be educated to believe in the possible cura bility of lymphosarcoma so that its recognition may be earlier and treatment can be more often begun in the stage of curability

SALICYLISM

"Although salicylates have been used in the treatment of rheumatic fever and for relief of pain in the other arthritides for nearly seventy years, not until the recent work of Coburn has it become customary to administer massive doses of salicylates over a protracted interval Little attention has been directed toward the possible toxic effect of the drug when used over a long period with high plasma levels and high tissue saturation "

Thus do Caravati and Whims¹ open their discussion of this timely and somewhat neglected subject The authors go on to tell us that "in the application of this therapeutic procedure in a comparatively small series of cases, we have encountered trouble-some and potentially serious toxic reactions and the purpose of this paper is to emphasize the importance of recognition of these untoward symptoms and to

suggest a therapeutic regimen for their control."

"The active principle of all the salicylates is salicylates, long recognized, is thought to be due to the effect of salicylate and on the hypothalamus, causing reduction of fever and obtundation of The central action of the drug is probably also responsible for most of the toxic phenomena associated with its use. The most commonly seen unfavorable reactions are tinnitus, dizziness, nausea, and vomiting, while fever, tachypnea, cutaneous

eruption, mental unrest, and coma are not rare "Failure to recognize the occurrence of severe toxic mental changes leads to profound come and ultimate death When these symptoms are noted, appropriate treatment should be promptly instituted and should consist of the following (1) discontinue the drug, (2) give large doses of sodium bicarbonate, this will cause diuresis, raise the pH of the urine and promptly reduce the plasma salicylate level, (3) establish proper hydration with adequate fluids, either orally or parenterally, (4) apply cooling measures for fever, if present, (5) give food to meet excessive catabolism, (6) if central depression is marked, caffeine, or ephedrine may be required

And in conclusion we are told that "(1) evidence has been presented that indicates that the prominent symptoms of salicylism are manifestations of the central effect of the drug, that tinnitus, dizziness, nausea, vomiting, fever, tachypnea, and encephal opathics noted when large doses of salicylates are administered are caused by the effect of the drug on the higher centers

"(2) That intravenous salicylate therapy is unnec-

essary "(3) That alkalies should not be given concomitantly with salicylates when it is desirable to reach a high plasma level, but should be reserved for use when toxic symptoms develop

"(4) That plasma salicylate levels are promptly

reduced by alkalı therapy

"(5) That an awareness of the toxicity of salicyl ates should be constantly present when administer ing the drug in large doses or over a prolonged period of time"

Caravati and Whims have rendered a service in calling attention to the untoward effects of the sal icylates, especially now that large doses are being employed by many practitioners For such a long time the salicylates have been prescribed freely and have been regarded as being largely free from danger that it is probable that many doctors are none too well informed as to their injurious possibilities Though the authors are careful to inform us that they investigated only a "comparatively small series of cases," their warning should not go unheeded. And, it is to be hoped, that their investigations can be repeated upon a larger scale, both by themselves and by other observers - Journal of the Medical Association of the State of Alabama, October, 1946

CLINICOPATHOLOGIC CONFERENCE

BETH ISRAEL HOSPITAL, New York City

Date. October 4, 1946

Conducted by Alfred Plaut, M.D., and Harry Vesell, M.D.

Aortic Stenosis, Bleeding Intestinal Polyp, and Subclinical Gaucher's Disease

DR. H VESELL S S, a 63-year-old white woman, a retired school teacher, was admitted to the private service of Beth Israel Hospital on July 1 1046, acutely ill with the chief complaints of cheat pains, shortness of breath, and faintness She had had several large tarry or bloody stools during the previous week

Her past history revealed that in childhood she had had pains in her joints which were called the intermediate. She also had diphtheria in childhood Since her early twenties, she was told by physicians that she had a cardiac condition. She taught in the public schools of the city for about thirty-five years, and during this period, her attendance record was quite good. She did not have to remain home much for illness.

In August, 1042 somewhat suddenly she developed headache and drowsiness which rather rapidly progressed to croma. There was considerable rigidity of the neck with local tenderness. She was seen at 11:00 p.m. and at 8:00 A.m. the next morning a spinal tap was performed. The spinal fluid was bloody and under increased pressure. She gradually emerged from the coma and recovered without any paralysis, weakness or excessry disturbance. The diagnosis was subaraclinoid hemorrhage. A low grade fever, 100 to 100 6 daily, persisted for ten days. She was, therefore, admitted to Beth Israel Hospital for needical investigation of the cause of the fover.

On examination at the hospital she did not appear ill and was out of bed part of the time Her eyes appeared normal. Examination of the funds revealed distinct disc margins. Of chief concern were the cardiac findings The heart on percussion appeared slightly enlarged to the left. Ameal impulse was of normal force-a suprasternal impulse was not palpable, rate 84 A loud, grade 4 to 5 (6 maximum) systolic murmur was heard over the aortic area and transmitted over the entire precordium and to the vessels in the neck. A2 was clear and of normal intensity A systolic thrill was felt over the aortic valve area. The blood pressure was 150/100 Radial pulses felt normal Lungs were clear The abdomen was distended, liver and spleen were not palpable. There was no edema of the extremities. There were no ab-normal neurologic signs. Rectal examination was not satisfactory, because the anal ornice was very small, barely admitting the up of the little finger

Laboratory data.—Urine examination and complete blood count were normal A blood culture was sterile

Fluoroscopy revealed the heart to be slightly enlarged to the left with a rounded contour of the left ventricular border, the north appeared slightly dilated and tortuous. The pulsations of the left ventricular border in the antero-posterior position were moderate, not increased

She remained in the hospital two weeks during all of which time her temperature was normal and she felt quite comfortable.

The diagnosis was recent subarachnoid hem orrings with apparent complete recovery, rheu matic heart discase, aortic stenosis regular sinus rhythm and Class 2 (in accordance with nomenclature of New York Heart Association)

She was advised not to return to school in the fall but to apply for a sabbatteal year leave of absence During the following year, she visited the office of her physician several times. She complained of occasional dizziness, pum in the back of the head, and over the fifth and sixth dorsal vertebrue. On fluoroscopy, on two occasions, in the right oblique position, the nortic valve was visualized.

She was fairly comfortable until the morning of August 3, 1943, when she passed a large dark red and tarry stool, and became dizzy and faint, she had severe palpitation and pains in the upper sternal area and right side of the chest with shortness of breath She was pale and it was apparent that she had lost a good deal of blood She was taken to the hospital immediately and a transfusion of blood was given. Only 300 cc. were given because of the cardiac condition. The blood count after this was 2,480,000 red blood count, 7 Gm of hemoglobin, 6,000 white blood count, achromia was noted. A second transfusion of 300 cc. of blood was given several days later The cardiac sounds and murmurs were simi lar to those observed on the first hospital ad mission Anelectrocardiogram revealed the type of trucing seen with marked left ventricular strain a tall R₁25 mm , RS-T depressed 1 5 mm in lead 1. 83-25 mm, in CF, a small Q of 4 mm, R 27 mm.

and RS-T depressed 2 mm The cardiac rate was 100 and regular Two weeks after admission the patient improved enough for investigation of the cause of the blood in the stools Since some of the stools contained fairly bright (beet-colored) blood, barium enema was given for examination of the colon This was reported as negative After three weeks in the hospital, she was discharged

For the next three years, she felt fairly well, was able to get around and visited friends fre-Several times she passed some dark red and tarry stools following which she had severe boring pains in the upper sternal region and to the right This area was also tender There was, also, a milder midsubsternal pain Occasional palpitation brought on by effort and dizziness and faintness with shortness of breath also occurred, often related to effort She was not known to have lost consciousness with these spells of faintness The episodes of chest pain, palpitation, and faintness gradually increased in frequency and severity occasions during the past year she had paroxysms of nocturnal dyspnea She received liver, iron, and vitamins, and was on a cardiac regimen of limited activity, with salt restriction and digitalis She was reluctant to have further x-ray investigation of the gastrointestinal tract as advised

On July 1, 1946, after having had several large dark red bloody and tarry stools during the previous week, she developed a marked increase in the chest pains, palpitation, faintness, and shortness of breath. She called her physician who, because of the marked pallor apparently due to the loss of a large amount of blood, referred her to the hospital for immediate transfusion.

Examination at the hospital revealed the patient to be acutely ill, dyspneic, orthopneic, pale, with a slight cyanotic tinge and complaining of considerable pain in the upper sternal region and slightly to the right over the aortic valve area She felt faint on the slightest effort systolic murmur and thrill were as previously noted, heart rate was 110 and regular, the blood pressure—140/98 (it had risen to 200/106 during the past year) Many moderate size rales were heard at the right lung base The liver was enlarged to 2 fingers breadth below costal margin and tender There was a 1-2 plus pretibial and ankle edema

The blood count was 2,460,000 red blood count, 7 Gm hemoglobin, 13,000 white blood count, 71 per cent "polymorphonuclears" A transfusion of 300 cc of blood was given slowly, taking about two hours She seemed to improve immediately after this, but about one hour later, marked shortness of breath returned and pulmonary edema rapidly developed Emergency

cardiac measures were applied, including the administration of oxygen, digitaline nativelle, and internal phlebotomy. The respiratory distress, however, increased and the patient died at 7 15 PM—five hours after admission.

The antemortem diagnosis was (1) rheumatic heart disease, because of the history of probable rheumatic fever in childhood, and of heart disease since her early twenties, calcareous aortic stenosis, because of the characteristic loud aortic systolic murmur and thrill and visualization of the calcified aortic valve on fluoroscopy, and pul monary edema, and (2) bleeding from an undiagnosed gastrointestinal lesion, probably in the colon

DR A PLAUT The heart of this elderly woman, 146 cm long, weighed over 500 Gm was characteristic of aortic stenosis, the apex was formed entirely by the very thick left ventricle The aortic ostium whose wall was 2 5 cm thick was a very narrow irregular slit, surrounded by variously shaped calcific masses one of which made a bean-sized bulge in the right auricle aortic cusps, their commissures and the sinuses of valsalva were entirely out of shape openings of the coronary arteries, however, were The other ostia and valves were not remarkable, the coronary arteries were of normal caliber throughout Such a calcific aortic stenosis has been interpreted in different ways by generations of pathologists, sometimes an inflammatory origin being assumed, sometimes an atherosclerotic one Today most pathologists believe that rheumatic heart disease is the cause of all or nearly all such lesions Proving this is often In our case most of the sections reveal calcification and fibrosis only, but, occasionally, one finds single or grouped cells with basophilic protoplasm They are highly suggestive of rheumatic inflammation The myocardium contained only insignificant scars

The colon contained a large amount of soft blackish matter which gave a positive benzidine and guaiac test. A soft pear-shaped polyp, 5 by 3 by 1 cm, was attached in the transverse colon, 50 cm beyond the ileocecal valve. On its deep red tip, three pinhead-sized bright red dots stood out distinctly. There also was melanosis coli.

The other organs were not grossly remarkable A cortical adenoma, 0.5 cm in diameter, was found in the right suprarenal gland. The spleen was moderately enlarged (255 Gm), the liver slightly so (1,660 Gm). This was not astonishing, considering the severe circulatory disturbance. But who describes our astonishment when, in the routine microscopic section, the splenic pulp was found full of Gaucher cells, which predominated over all other tissue elements? The cells were irregularly ovoid, 25 to 40 micra long, with the

often described crumpled appearance of their cytoplasm Characteristic blue streaks could be demonstrated with the Asokarmin stain. At points where the Gaucher cells were closely packed, the reticulum fibers were more or less damaged as seen in the Bielschowsky stain.

The vertebral marrow contained numerous Gaucher cells but not as many as the splcen Only one of the eleven lymph nodes examined, a para-nortic one, showed the Gaucher cells. No Gaucher cells were found in the liver or in other

organs.

In the light of these findings the discrepancy between the severe intestinal hemorrhage and the colonic polyp appears less striking, since a tendency to bleeding has been described in Gaucher's disease. It is possible, also, that some of the pain the patient complained of was not rheumatic but was caused by the Gaucher disease.

Such cases must be exceedingly rare Gaucher's disease in itself is not frequent, absence of splenomegaly is very unusual. The question how often Gaucher's disease might exist without causing clinical symptoms cannot be answered because too small a percentage of people are autopsied If one considers the occurrence of complete remissions, lasting ten years and more, one must cease to marvel about the clinically unknown Gaucher's disease. One similar case is on record at Montefiore Hospital In 1943 J V Petit and E M. Schleicher (American Journal of Clinical Pathology, 13 260, 1943) published an observation of unexpected Gaucher's disease with a small (100 Gm) normal looking spleen. Their patient, a 79-year-old man, died six days after admission, of bronchopneumonia and cor onary sclerosia. His clinical symptoms were vague, the physical findings negative. A sternal puncture revealed Gaucher cells. At autopsy they were found in the spleen, the bone marrow and in one lymph node No chemical examina tion for cerebrosides are reported

In our case the spicen contained 0.75 mg per cent cerebroades. While this figure is of a much lower order of magnitude than in Gaucher spicens, it is way above that of normal spicens which were examined as controls (0.03 mg. per cent 0.12 mg per cent, 0.13 mg per cent, 0.17 mg per cent.)*

More similar cases must be examined before one may talk about "formes frustes" of Gaucher's disease. It might be of value, in such instances, to pay attention to the differences in the carbohydrate component of normal kerasin and that of kerasin from Gaucher's organs ** Un fortunately no splenic tissue of our case was avail able for such an examination.

No family history of Gaucher's disease could be chetted. According to Thannhauser, † the familial tendency is evident in one third of the cases.

Dr. A Bendick. The x ray of the colon with a barium enema taken at the time of the first severe episode of bleeding in 1943 seemed to be normal at first examination. The patient was unable to evacuate the barium satisfactority in that films after air insufflation could not be taken. On review of the films now, however, knower where the lesion is one can see in the transmitter of the polynity, corresponding to the site of the polynity, corresponding to the site of the polynity, corresponding to the site of the polynity should be remembered that occasionally it was not excessary to repeat x mys of the colon or much as four or five times to demonstrate parameters.

DR M WEINGARTEN Injection of ar far double contrast after evacuation of the lements ordinarily would visualize a polyp, but this ease the banum was so poorly evacuated at do not think that the air-contrast telemental have been helpful

Sigmoidoscopy was not performed, prosect because of the very tight and sphinter. The lesson in this case was too high to be readed on the instrument, but I mention sigmoid with only to stress its importance, because very case a lesson of the rectum or sigmoid when a learly demonstrated by sigmoidoscopy in the revealed by x ray at all

Cardino patients in congestive hear and with advanced artenosclarotic cardinal disease may have gastrointestinal bloom gastrointestinal tract, but this is more midependent gastrointestinal leasons to be sought.

About two thirds of the patient or more polyps of the colon have rectal bleeding. This is small trarely do these patients have an success of congenital heredofamiliar, as seen in infants and adolescent.

I should like to ask the head to be thinks that the increased be could be explained, as suggestion the finding of Gaucher cells, the tributestinal bleeding is often cher's disease

Mention is made, in the instance of the stools and the passage of borry stool" is a descriptive to include grossly blood; tarry stools we mean blar rarely produced by a

^{*} Chemical tests done by Dr Ella Fishberg ** Danislson, Tr., Hall C. H., and Everett, M. R.: Proc. Soc. Exp. Med. 40: 569 (1942)

[†] Lipidoses Reprinted free a

although occasionally they have been known to occur with a lesion in the ileum

DR FRANK BASSEN I should like to state that I have never observed bleeding as a symptom in any of the many cases of Gaucher's disease which I have observed I find it hard to believe that the bleeding in this case was caused in any way by the Gaucher element

DR MAUSNER Was the faintness due to the loss of blood only or to the heart disease too?

DR H VESELL Undoubtedly the loss of considerable blood was the cause of the faintness during and shortly after the episodes of bleeding However, it should be remembered that dizziness or faintness associated with slight effort may be a symptom of advanced aortic stenosis. Actual fainting with loss of consciousness with effort as noted by Marvin about ten years ago was not observed in our case. Angina of effort, which may be a symptom due to aortic stenosis, was present.

An atypical feature of the aortic stenosis which was tight was the presence of a fairly clear A2 of normal intensity. Dr. Libman called attention to the increased force of the apical impulse with absent suprasternal pulsation as a diagnostic finding in aortic stenosis. A strong apical pulsation on palpation and increased pulsation of left

border on fluoroscopy were looked for but not found present

Patients with aortic stenosis often do well for many years up to middle and old age †† Our patient of sixty-three years with an advanced and rather tight aortic stenosis was able to lead a fairly active life until she lost considerable amount of blood from the bleeding intestinal polyp

DR LEON SUSSMAN In regard to transfusion of decompensated cardiacs who are severely anemic, it is important to keep the total volume of the transfusion as small as possible. Since the blood is given for the oxygen carrying capacity of the erythrocytes, the supernatent plasma should be removed before administration. The packed red blood cells will then be only about half of the total original blood volume which would have to be given. The embarrassed circulation is thus spared an unnecessary extra strain.

INTERN Was the cause for the subarachnoid hemorrhage discovered at autopsy?

DR A PLAUT Permission for examination of the skull was not obtained

†† This is probably due to the fact that the early rheu matic infection was mild and also to the mechanics of actic stenosis. The blood flow through the narrowed acrtic estum is still considerable being proportional to the fourth power of the estium diameter (Poiseuille's law) and ejected by a greatly hypertrophied left ventricle.

PROBLEM OF IMPAIRED HEARING RESTS ON TREATMENT AND CURE

Emphasis in the problem of impaired hearing should be placed on treatment and cure rather than on prevention, according to A. C. Furstenberg, M.D., of Ann Arbor, Mich. Writing in the September 21 issue of the Journal

Writing in the September 21 issue of the Journal of the American Medical Association, Dr Furstenberg states "I have never been convinced of the truth of the often published statement that 75 to 80 per cent of all cases of impaired hearing are preventable, and that this large proportion of its victims could have avoided their affliction had it been identified early and had proper methods of prevention been instituted

"How can one prevent a degeneration of the auditory nerves which often occurs as the result of severe toxic diseases? How are physicians to keep the eustachian tubes of children in working order and the middle ears free from infection during the course of diseases which infect the upper respiratory tract, particularly measles, scarlet fever, mumps, and whoop-

world War II saw the first practical adoption of a program for the treatment of deafness "I point with pride and with a deep sense of gratitude," the author writes, "to those far sighted and efficient representatives of the Army and Navy who created an epochal program of service by the establishment and efficient operation of four centers for the rehabilita-

tion of the hard of hearing in military service. These important units located at strategic points in the United States, Deshon General Hospital at Butler, Pa, Borden General Hospital at Chickasha, Okla, Hoff General Hospital in Santa Barbara, Calif, and the US Naval Hospital at Philadelphia, have done a colossal job and have achieved memorable progress in the care of the hard of hearing that will not fail to attain lasting recognition. The pioneers in this field wisely combined all available talents—those of the otologist, psychiatrist, psychologist, physicist, electrical and acoustic engineers, and speech experts to function in an integrated and cooperative program that has rendered service of inestimable value to the unfortunate persons whose hearing was impaired in the line of duty

"It remains now for civilian physicians and for public health and welfare agencies interested in this field to become familiar with the yeoman service of these great centers and to establish several more along similar lines, geographically located to render the greatest possible service to the people of this country.

"Unfortunately, progress in civic agencies is frequently slow, but the impetus given this magnificent program of service to the hard of hearing by military personnel is destined to inspire, if not demand, a similar plan of action in civilian life"

ABSTRACT OF MINUTES OF THE COUNCIL OF THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

A TITS meeting on December 5 1046 the Council considered various matters, taking final action or directing further study and reports as indicated under the following headings.

Secretary s Report

Remission of State Assessments -The remission of State assessments was voted on account of service with the armed forces for one member for 1947 one for 1946 six for 1945 three for 1944 also on account of illness for Drs Walter A Shoales, Bernard B Schnapper Anthony Wollner, Frederick C Robbins, Alexander M Stewart The refunding of dues for two members was authorized

Meetings — Your Secretary finds it difficult

properly to express his appreciation for the action which you took regarding him at your last meeting Have tried hard to perform my duties to the best of my ability Your kind approbation has touched

me deeply

The day following your last meeting your Secretary attended a meeting presided over by Mr Pink, in the office of the Associated Hospital Service of New York, Inc., where representatives of the Vet erans Administration discussed with hospital execu tives and Blue Cross officials a proposed contract regarding hospitalization of veterans with serviceconnected disabilities under the care of practicing physicians. Subsequently I made known to I rem dent Hale and others the steps that were contem plated to include certain medical services in this con tract. Dr Hale has communicated with General Hawley and I have explained the stand of organized medicine to Dr. Harding and Dr. Lane of the Vet Administration

On November 18 your Secretary attended a meeting of the State Charities Aid Association, New York City Visiting Committee at the Colony Club where Dr Rusk spoke on New Horizons of the Handi

capped.
Two days later in Syracuse your becretary was much impressed with the fine progress that was made at a meeting of the Subcommittee on Medical Expense Insurance of the Committee on Public

Relations and Economics

On November 21 the Middle Atlantic States Regional Conference of the American Medical Association Council on Medical Service was held in Philadelphia. At this meeting the status of physicians in the coal-mining districts and matters relat ing to medical service for veterans with serviceconnected disabilities were among the subjects discussed.

On November 22 your Secretary attended a meet ing of the Nurses Advisory Council of the New York State Education Department in Albany, and the following morning conferred with Miss Mary Don Ion, Chairman of the Workmen & Compensation Board. Miss Donlon expects to appoint a committee to consider proposed changes in the minimum fee schedule under the Workmen's Companyation law and ratings, under the Chairmanship of Dr vathan B Van Etten The President, with the ap proval of the Council, appointed the Secretary as the State Society a representative.

Communications—Letters from the Medical So-ciety of New Jersey and the Connecticut State Medical Society appointing Dr James F Norton Medical Society appointing Dr James F

(Dr D Ward Scanlan, alternate) and Dr Cole B Gibson (Dr Joseph H Howard alternate) respectively as representatives at the 1917 Annual Meeting of the Medical Society of the State of New York

Letter from Dr William B Rawls Chairman of the Coordinating Council of the Five Yew York City Metropolitan Counties inviting the Council of the Medical Society of the State of New York to send a member to the meetings of this Coordinating Council After discussion,
It was decided to request Dr W Guernsey Frey,

Jr to attend the next few meetings,

Treasurer & Report Was Accepted

Report of the Executive Officer

Dr Aranow Chairman of the Legislative Committee read a report from Dr Hannon in which lie stated that he regretted his inability to attend the Council meeting because it had been thought ad visable for him to attend a meeting in Albany called by the Joint Legislative Committee on the Educa-tion System of New York State instead, where a n vision of the Medical Practice Act was to be disconservi-

Activities of Committees

Committee on Legislation.-Dr Aranow Chair man amplified Dr Hannon's report on what took place at the meeting of the Subcommittee to Study Medical Practice Legislation in the State Society's office on December 3 1946

The first topic to be taken up was consideration of the degrability of introducing legislation for the purpose of establishing a basic science law Aranow stated that the Committee had studied the subject of basic science law thoroughly and did not feel that it would solve the problem of the illegal practice of medicine

Dr Cullo and Dr Higgons ably presented the opposing viewpoint. They felt that a laste science bill should be introduced into the Legislature in Dr Manzella and Mr Anderson gave opinions on the procedure of issuing an injunction.

The second subject to be considered was the

proposed bill to amend the law rela ing to tile practice of podiatry by changing the present definition Mr Charles Hollonder Counsel, and Mr Applebaum and Mr Wise, Secretary and I resident, respectively of the I odiatry Society presented their reasons why this should be done and to ask the Committee's aid and suggestions. The podiatrists were asked to send the curriculum of the First Institute of Podi atry—the only school recognized by the State—to the Committee Dr F W Williams addressed the committee in opposition to the proposed Podiatry Bill

On motion the President was authorized to appoint a subcommittee of three to study the curreulum of this school of podiatry

The next subject to be considered was a proposed bill to amend the practice of medicine law by introducing the terms 'physiotherapy and "physiotherapist throughout, to indicate that the act applies to physiotherapists as well as to M.D s and osteopaths. This bill was presented to the Committee for further study

"Under consideration of other probable bills affecting the practice of medicine. It would be well to introduce a bill which would, without any question, be all-inclusive of all efforts to heal the sick, prescribing punishments for its infraction

"Dr Kaliski will present copies of four bills per-taining to practice of radiology, pathology, anesthe-siology, and physical medicine to members of the

"The proposed bill affecting the hoensure of practal nurses was then discussed. It has been sugtical nurses was then discussed. It has been suggested that the name of "practical nurse" be changed to "trained attendant." The State Nursing Association is against this. The Council is not in favor of such a change in name until further information of

its desirability is shown
"The Committee agrees with the Nursing Association that it is not wise to abolish the licensing of

practical nurses"

Constitution and Bylaws —Mr Clearwater reported that he had received two requests for approval of amendments to bylaws One from the Medical Society of the County of Warren needed a few changes, which were approved by the Council. The proposed changes of bylaws of the Eric Council Medical Society were accepted.

Finance Committee — Dr Louis H Bauer, Chair-

man of the Finance Committee, submitted a pro-

posed tentative budget for the year 1947

The Council voted to adopt this budget and refer it to the Trustees with the request that they approve it for a period of six months, to be sub-

sequently reviewed. Joint Committee of the Hospital Association of New York and the Medical Society of the State of New York.—Dr Wertz, Chairman, reported that the committee was planning to have a meeting soon, and inquired if he should notify them of the action taken by the Council in regard to the Veterans Administration proposed contracts in relation to hospital care

It was voted that the Chairman report the State

Somety's objections to the meeting

Committee on Medical Publicity -Dr Winslow. Chairman, reported that during the past three weeks news releases regarding postgraduate education and teaching programs were sent to newspapers in the counties of Monroe, Nassau, Orange, Rockland, and

First copies of the booklet "Check and Double Check on Sickness Insurance" were to be in the hands of council members on December 15 The booklet is 64 pages and contains 133 questions and answers on important phases of sickness insurance, voluntary

Miss Lyon conferred with Mrs Madden, President of the State Woman's Auxiliary, on November 23, regarding the program of the Auxiliary She keeps in touch with other officers. As part of the cooperative arrangement with the Public Relations Bureau, each organized county auxiliary is building a list of names of community leaders for use by the bureau in its educational work

Mr Thomas E Walsh joined the staff November He is making a survey on ways to improve the speakers' service functions of the Public Relations Bureau

On request of Mr Andrew W Horton, of Rochester, general chairman of the Western Division of Practical Nurses of New York, Inc., arrangements have been made to provide exhibit material at the convention of practical nurses to be held in Rochester in May

Council on Medical Service and Public Relations Dr Aranow, Chairman, reported that meeting of the Middle Atlantic States Conference was held two weeks previously The most important part of two weeks previously the discussion concerned Mr Lewis' new sickness insurance plan for soft coal miners. The idea offered was that if we could arrange with the group that has charge of the medical care of the coal miners a plan similar to that with the Veterans Administration, it would be of great help to the medical profession

The other question discussed was Colonel Harding's idea of sending the veteran to the clinics before

sending him to a private physician

Dr Kenney amplified the above by stating that the discussion on the proposed bituminous coal agreements was very carefully outlined by Dr Martin of the Council on Medical Service He gave the background of the type of medical care the miners have been getting. It is hoped in any scheme to come out of Mr. Lewis' new agreement with the government that there will be a joint project in which not only the umon, but the employers, the local community, and everyone concerned will cooperate to bring medical care to the miners on a basis similar to the present hospital insurance plans

Committee on Nursing Education.—Dr. Anderton, Chairman, stated that the direction of the House of Delegates that the Nursing Education Committee take up with the nurses' organization and the hos-pital organization the whole question of nursing and nursing education in New York will soon be under-

Committee on Public Health and Education -Dr Mitchell, Chairman, reported that he had attended on November 20, 1946, in Syracuse, the Joint Meeting of the Subcommittee on Medical Expense Insurance of the Committee on Public Relations and Economics and Directors of Medical Care Plans in New York State, on December 3, 1946, in New York City, he attended a meeting of the Council Committee on Public Health and Education, and the Subcommittee on Mental Hygiene with the local Psychiatric Advisory Board of the Veterans Administration Also present at this meeting were officers of the Medical Society of the State of New York On December 4, 1946, in New York City, he attended a meeting of the Council Committee on Public Health and Education and the Subcommittee on Child Welfare Also present at this meeting were officers of the Medical Society of the State of New York and representatives of the New York State Department of Health

A letter from the State Health Department, requesting that consideration be given to a plan for having the whole State divided into regions where large institutions would be centered around medical schools, was discussed, and it was decided to advise the representatives of the State Health Department not to try to move too rapidly, and that we would confer with them as often as it seems necessary was also decided not to make any recommendation

to the Council at present

Another matter was the obtaining of information as to whether or not patients who have received plasma or some other blood derivatives develop hepatitis or other sequelae It was finally agreed that the Health Department prepare a report card, approved by us, to be sent to the attending doctor for the desired information

Subcommittee on Hard of Hearing and the Deaf —Dr Gordon D Hoople, Chairman, reported "On November 13, 1946, Dr E P Fowler, Jr, and the Chairman of the Subcommittee on Hard of

Hearing and the Deaf, visited in Buffalo with the members of the Buffalo Otolaryngological Society The evening was spent in a discussion of the possi bilities of conservation of hearing centers and the possibility of establishing such a center in Buffalo Dr Bozer head of the Department of Otolaryngol ogy in the College of Medicine of Buffalo Univer sity, gave Dr Fowler and myself reasonable assur-ance that such a center will be started soon in Buffalo"

Postgraduate Education.-Instruction has been completed in the following county medical societies Cortland Monroe, Nassau, Orange Rockland and Schenectady

Instruction is being given in Chenango Ontario,

Tloga St. Lawrence, Jefferson and Ulster Requests for instruction have been received from Nassau and Richmond county medical societies.

Arrangements have been completed for instruction to be presented in Broome County at a later date

Arrangements have been completed for a Regional Cancer Teaching Day to be held in Troy New York, on December 12 1946 The memberships of the following county medical societies will be invited Columbia, Greene Remsselaer Saratogn Schenec-tady and Washington

The report was accepted

Committee on Public Relations and Economics -Dr Wertz Chairman, reported that he had attended a meeting of the N Y State Joint Legislative Com mittee on Industrial Labor Conditions on December 2 in New York. The discussion was on sickness compensation insurance There is a bill in the Legislature called the Condon-Clancy Bill which would provide anckness insurance for employed persons who

Dr Werts requested Mr Farrell, Director of the Medical Care Insurance Bureau to report on the activities of the Bureau, which he did as follows

"On November 5 your Director met with Dr H. Aaron, Chairman of the Subcommittee on Medical Expense Insurance in Buffalo to arrange for a joint meeting of the Subcommittee on Medical Ex pense Insurance and Directors of the Medical Care Plans in New York State on November 20

On November 15 he spoke before the Senior Medical Students at Syracuse Medical College on invitation of Dr O W II. Mitchell

"On November 20 he attended a joint meeting of the Subcommittee on Medical Expense Insurance of the Committee on Public Relations and Economics and the Directors of Medical Care Plans in New York State. In addition to the Chairman and members of the Committee and Directors of the Plans, there were also present Drs Hale, Bauckus Anderton, Mitchell, Post, Wetherell, and Havle, and Mr William C Gould, representing the New York State Insurance Department. It was recommended that a full report of the meeting be published in the JOURNAL

On November 21 he attended the Third Semi annual Meeting of the Middle Atlantic States Regional Conference of the American Medical Association Council on Medical Service in Philadelphia.

Subcommittee on Public Medical Care.—Dr Wood, Chairman, reported that the Committee had prepared a questionnaire to ascertain whether or not there is malnutrition in welfare cases, with an effect on morbidity increased hospital care, etc. be distributed as previously voted by the Council.

He stated a meeting was scheduled with the Welfare Department, when a joint statement from the Department and the State Society will be considered It was roled to accept the report.

Publication Committee. - Dr Kosmak, Chairman,

reported verbally as follows

The Publication Committee met on December 3 and discussed the usual routine matters that come before it every month We regret that we still have to continue with our apologies for being unable to enlarge the size of the JOURNAL, Mr Anderson has been in conference with a number of paper people and we hope that by the first of April the Journal will be larger

Comments have reached me and have reached some other members of the Committee about the number of advertising pages equaling or exceeding those of the editorial content. Mr Anderson has prepared a very careful tabulation of the advertising which was included in the JOURNAL during the cur-rent year and it was found that in 1946 42 per cent of the contents has been advertising matter. Well, that looks perhaps to some people like an unfair proportion, especially when it is found in a few issues that the number of advertising pages exceeded those of the literary content. That is an unavoidable situation, because contracts are made with adver tisers for a certain number of insertions during the year and very often they submit them in time for early issues Then before their contract expires they want to use all their insertions toward the end of the contract year. The number of insertions also affects the price which they pay for advertising that is to say a man can have twelve insertions for less in proportion than if he makes use of only six, so therefore, they rush into some of the issues which are due to be published shortly before their contracts expire.

The income of the JOURNAL depends practically entirely on advertising patronage. It is very likely that during the next two years there will be a re-duction in the number of advertisements. Probably the budgets of many concerns will reduce expendi tures for advertising so we feel that we should be protected and not subject the Journal to any reduction of its activities because of lack of funds. Thus far we have been very successful. There has been very little reduction even in recent times of the

applications for advertising.
We have received from a number of sources favorable comments about our editorial material It is very gratifying to get these when they come from members because it shows that more members are taking the JOURNAL out of the envelopes and reading it.

'We have also had a number of our editorials reprinted in other periodicals. Only recently the Christian Science Monitor reprinted one of our

articles in its entirety'

Directory "As far as the Directory is concerned with the publication of that has been surrounded with many difficulties. It was difficult to get paper, it was difficult to get a printer and it is now difficult to obtain a binder

The report was received.

Rural Medical Service.—Dr Mellen, Chairman reported that Dr Crocker who is the Chairman of the American Medical Association's Committee on Rural Medicine, has asked that questionnaires be sent to the Secretaries of each county society in the That has been done out of this office, but only eleven replies have been received. hardly adequate to make any report on.

Committee on Veterans' Affairs.-Dr Mellen Chairman, reported verbally as follows

We have sent out what we think is our last ques-

tionnaire, to pick up the remaining tag ends. The secretaries have responded very well to this, and it looks as if this committee's activities are just about closed up "

These reports were received

Veterans Medical Service Plan of New York, Inc
—Dr Anderton, Secretary, reported that the Board
of Directors of the Veterans Medical Service Plan of
New York, Inc, had met in the offices of the State
Society on December 4, 1946 — Among other matters
a letter from the Veterans Administration Branch
Office No 2 to the Managers of the Veterans Administration Regional Office, Buffalo, signed by Dr
C F Von Salven, Acting Branch Medical Director,
dated December 3, 1946, was discussed, and it was
decided to send a telegram to Dr Paul R Hawley,
Chief Medical Director, Veterans Administration,
Washington, D C, asking for clarification

"The question of x-rays, anesthetics, pathology,

"The question of x-rays, anesthetics, pathology, and physiotherapy being included in hospital care for veterans was reviewed. Contracts between V A and Blue Cross organizations, including these services, are in force in New York, Syracuse, Albany, and Buffalo. Bills for x-rays, however, must be signed by roentgenologist in hospital before payment is authorized. A letter written by Dr. Hale to Dr. Hawley requesting deferment of further contracts with hospitals until the question could be reviewed by the Board of Directors of Veterans Medical Service Plan was read. Dr. Hale stated no reply had been received from Dr. Hawley. It was voted that the President or Board member be authorized to confer with Blue Cross organization protesting the rendering of these services by hospitals. It was further moved that the Council of the Medical Society of the State be requested to send a letter to Dr. Hawley, emphasizing Dr. Hale's letter and requesting a reply"

It was voted that the Council of the Medical Society of the State of New York formally approve in every way the communications that have been sent by the President to General Hawley, Medical Director of the Veterans Administration, and that they urge his immediate attention to the matters upon which information was requested in those letters, and that the Secretary be directed to forward such an official letter to General Hawley

"The matter of printing and distributing Part II of the fee schedule to physicians was reviewed. Dr Anderton was requested to confer with Mr. Anderson on the approximate cost of printing and mailing and refer this information to the President of the Corporation for discussion at a subsequent meeting."

The acceptance of the resignation of Dr Gartner as coordinating physician was accepted with regret to take effect on the appointment of a successor Dr Gartner's fine work was highly commended

Dr Bauckus was authorized to appoint a coordinator to replace Dr Gartner, and to appoint a coordinator for the Syracuse area, subject to approval by the Board

Drs Ross, Bauer, and Cunnifie were appointed a committee to select a coordinator for the Brooklyn

office, subject to approval of the Board.

Woman's Auxiliary — Dr Reuling, Chairman, of the Advisory Committee, reported for the Woman's Auxiliary, that the President of the Woman's Auxiliary had visited or addressed the following county meetings Oswego, Cayuga, Genesee, Columbia, Lewis, St Lawrence, Steuben, Schuyler, Yates, Cortland, Chenango, Ulster, Seneca, Monroe, Bronx, and Allegany A number of these counties were in the process of organizing a Woman's Auxiliary A letter has been sent by the State Public Relations Chairman, Mrs James W Bucci, to each county auxiliary president, public relations chairman, and the presidents of the county medical societies urging cooperation with the American Academy of Pediatrics Survey This was done at the request of the District Supervisors of the Survey

Eleven counties have completed their mailing lists for the Public Relations Bureau of the State Society.

New York City

It was voted that the Chairman of the Advisory Committee of the Woman's Auxiliary express the appreciation of the Council to Mrs Madden for her good work in the past year

Committee on Workmen's Compensation—Dr Dattelbaum, Chairman, reported on the following

matters

Compensation Trial On November 12, 1946, an additional hearing was held in Liberty, New York, in the case of a physician practicing in Orange County against whom charges were preferred by the Chairman of the Workmen's Compensation Board and the matter referred to the adjoining county (Sullivan) for hearing Gortain incidents occurred following a previous hearing which required this hearing Mr Bell of Mr Martin's office and your Director took part

Arbitration Arbitration sessions were held in Nassau County on November 8 and in Newburgh on November 21 for the counties of Ulster, Sullivan,

Dutchess, and Orange

Fee Schedule We have been receiving and submitting to the Chairman of the Workmen's Compensation Board, additional supportative evidence

regarding the fee schedule

Legislation There will be a meeting of the Legislative Committee called by Dr. Aranow on Tuesday, December 3, at which time we shall again consider those measures which were approved by the Council last year but unfortunately were not considered favorably by the Legislature. Most of the measures were sidetracked because of the shortness of the session and lateness of their introduction. We hope the early introduction of our measures this year will accord them greater consideration and possibly favorable action.

Appeal of Dr Leo S Sacharoff The matter of the appeal of Dr Leo S Sacharoff against a judgment by the Industrial Commissioner revoking his compensation authorization will be heard by the Court of Appeals in Junuary of 1947. The case will be heard on the merits this time. The doctor will argue that the x-ray laboratory which stated it gave him rebates was a corporation, could not practice medicine, and, therefore, the rebates cannot be considered as rebates in the providing of "medical care." Counsel for the Council of Radiologists, Anesthesiologists, Pathologists, and Physical Therapy physicians has advised his Council not to attempt to appear as amicus curiae but advised that the Medical Society should consider the advisability of appearing as amicus curiae in support of the action taken by the Industrial Commissioner.

New Business

Dr Hale made the sad announcement of Dr Kirby Dwight's death on December 4, 1946 He stated that Dr Anderton had written a letter to Mrs Dwight, flowers had been sent from the Society, and Dr Louis H Bauer had prepared the following resolution which was adopted

"WHEREAS, the Medical Society of the State of

New York has suffered a grievous loss in the death of Dr Kirby Dwight and

Wileneas, he had long been an arduous worker. for the interests of the public and of the medical profession and

WHEREAS, his ability had been recognized by his election as President of his County Society for several terms as Treasurer of the State Society and recently as Trustee of that Society

"WHEREAS, his wisdom, ability and kindlines-

will be sorely missed, therefore be it

Resolved by the Council and the Board of
Trustees of the Medical Society of the State of New York that it deeply regrets the passing of Dr Dwight and bo it further

Resolved that this resolution be spread upon the minutes and a copy sent to his family, and published in the New York State Journal of MEDICINE

Gerson's Cancer Treatment.—The Secretary read an editorial article which appeared in volume 132, number 11 of the Journal of the American Medical Issociation. After discussion

It was rotal that a copy of this editorial be sent to the Medical Grievance Committee of the New York State Education Department, stating it has been alleged that perhaps Dr Gerson's practice involves the practice of medicine with fraud and dereit

TYPHOID PATIENTS RESPOND TO THERAPY WITH BACTERIOPHAGE

Five California physicians reduced the death rate to five per cent among a group of 50 typhoid patients who were treated with a virus-like agent known as bacteriophage, according to an article in the Septem ber 21 issue of the Journal of the American Medical Association.

The physicians are Evelynne G know of South Pasadena, Walter E Ward, of Los Angeles, Paul A. Reichle Los Angeles A. G Bower Pasadena and

Paul M Hamilton San Marino

The authors state that bacteriophage, considered a parasite of bacteria, has been used for the past ten years in the treatment of patients with typhoid fever in the Communicable Disease Unit of the Los Angeles County General Hospital with which they are ar-ocusted

It is pointed out that the results with these pa tients were so spectacular because a specific type of bacteriophage was used for each patient. The num ber of bacteriophages is legion the article says, but each differs in its ability to attack certain types of Each patient was given the specific phage which would attack his own organisms

The following results were immediately noted (1) negative blood cultures 24 hours after treatment, (2) absence of fever (3) immediate clinical improve-

One of the most spectacular objective accomplishments of this form of treatment, the doctors write, was the rapidity with which the patient re-turned to his normal mental outlook. Within twenty four to forty-eight hours after bacteriophage therapy, the patient who had been comatose and in the typhoid state or who had demonstrated the characteristic a bining querulous obstreperous man ner amased everyone by his cheerful, grateful co-operative attitude. A state of well being existed Also patients whose anorexia before treatment was so great as to make forced feedings necessary, after ward usually asked for food, weakly at first and later vociferously

Typhoid fever bacilli are spread by faulty sewer age and contaminated water or through injected persons by fingers food, and flies Once the typhoid bacilli enter through the mouth they pass on through the atomach, enter the upper intestines, and set up an inflammation of the intestinal walls. They invade the lymph nodes, where they multiply rapidly and then they enter the blood stream. The death rate for many years has remained around 10 per cent

The specific bacteriophage in a dextrose solution was administered by injecting it into the veins over a period of four to seven hours. This was usually fol lowed by a moderate chill lasting approximately thirty minutes. After the chill the doctors noted that the temperature began to mount and reached a peak of 105 to 107 F within three to six hours. The temperature returned to normal within nine and one-half to twenty four hours after treatment was started and in most instances remained normal there-

In a discussion which accompanied the article Dr Wilton L. Halverson of San Francisco, states The spectacular nature of the recovery of these pa tients is something we don't forget when we see the patient go through the episode I believe this is a contribution which will be of great importance to us in typhoid

MEDICAL NEWS

National Conference on Medical Service Will Meet in February

THE 20th Annual Meeting of the National Conference on Medical Service will be held at the Palmer House, Chicago, on February 9 Registration will commence at 9.00 A.M. and the program will include discussions in the fields of national affairs, economics, and medical education. All

physicians are invited to attend, there is no registration fee

Dr Cleon A Nafe, Indianapolis, is president of the Conference, and Dr Creighton Barker, 258 Church Street, New Haven, Connecticut, is the secretary

Society of Medical Jurisprudence Has Symposium on Rh Factor

THE 021st regular meeting of the Society of Medical Jurisprudence was held at the New York Academy of Medicine on December 9

The program consisted of a symposium on the medicolegal aspects of the Rh blood factor The first talk, "Know Your Blood Group and Rh Factor Before You Marry," was given by Emily Marx, a member of the New York and Vermont Bar, and formerly justice of the Domestic Relations Court of New York City "The

Problem as the Immunologist Sees It" nas presented by Dr Philip Levine, director of the biological division, Ortho Research Foundation Dr John T Cole, assistant attending obstetrician and gynecologist, New York Hospital, spoke on "The Problem as the Obstetrician Sees It" Dr Harvey B Matthews discussed "The Implications as They Apply to the Obstetrician, the Newborn, and to the Public in General"

The New York Society of Neurosurgery

RECENTLY organized, the New York Society of New York neurosurgery is an outgrowth of a group of New York neurosurgeons who have been meeting informally at regular intervals since 1939. The present membership consists of twenty-four neuro-

surgeons who practice in the Metropolitan area Dr J Lawrence Pool, of 195 Ft Washington Avenue, is president, and Dr Sidney W Gross, of 8 East 83rd Street, is secretary

Brooklyn Drive Is Opened for Medical Center

A FUND campaign for \$16,000,000 to establish the Brooklyn Medical Center, which will give Brooklyn one of the largest medical centers in the world, was opened recently by officials of the Long Island College of Medicine at the office of Borough President John Cashmore

Of the money, \$10,000,000 is for construction of five new buildings for the college, \$6,000,000 will go to endowments to provide income for the operation of the center The present college location is at Henry and Dean streets, beside the Long Island College Hospital

The new buildings will include a nine-story basic science building to provide space for the teaching

of basic sciences, laboratory research, and a clinic Grouped about the basic science building will be a three-story medical library, a two-story auditorium to serve both the medical school and the community and a nine-story hall of residents, to provide living quarters and recreational facilities for students and the staff

The fifth building will be the Institute of Industrial Medicine

When the Center is finished, the present college building will become a laboratory and research center for the college The Institute of Industrial Medicine is being located there because of its near ness to Brooklyn's industrial section

Personalities

Dr William E MacDuffie has opened offices in Olean for the practice of general medicine

A native of Olean, he was graduated from the Buffalo University Medical School in 1942, served two years in the Buffalo City Hospital, and then entered the Army Medical Corps He served two years in the European Theater with the rank of captain *

Dr Conrad Lange has opened an office at 3325 Bailey Avenue, Buffalo

Dr Lange, formerly of Orchard Park, is a veteran recently discharged after three years of service in an Army Base Hospital in Georgia He was graduated from the University of Buffalo Medical

* Asterisk indicates that item is from a local newspaper

School in 1941 and completed his internship of a year at the City Hospital, Buffalo, before he entered military service *

Dr Walter Z Schwebel, of Troy, discharged from the armed forces in February, is reopening his office for the practice of pediatrics. Since his release from service he has been doing postgraduate work in pediatrics at the New York Medical College, the Flower and Fifth Avenue, and the Metropolitan hospitals in New York.*

[Continued from page 180]

and St Peter's Hospital Visiting physician at Ellis Hospital from 1900 to 1908, he was appointed to the honorary staff in 1946 He has been physician in the city tuberculosis clinic since 1931 and is the county physician He was a member of the board of managers of Schenectady County Tuberculosis Hospital from 1924 to 1939 and was president of Glenridge Sanatorium from 1936 to 1939 a member of the National Tuberculosis Association and the American Trudeau Society *

An increase in medical fees was adopted at a recent meeting of the Schenectady Medical Society,

and was maugurated December 1

In accordance with the fees set by the Veterans Administration and used by many other com-munities to meet the rising cost of practice, the fee schedule places a minimum of \$3 for office calls and \$4 for city house calls, it was announced Out-of-town calls, excluding Scotia, will be charged at the rate of 25 cents per mile to and from the place of appointment

The fee for calls after 9 00 p M will be \$5 *

Tompkins County

Simplified procedure relative to outpatient care of former servicemen was outlined to the Tompkins County Medical Society at a meeting in Memorial Hospital recently by Dr Frederick Lane of the Veterans Administration

Dr Lane, in charge of outpatient care in New York State and Puerto Rico, advised physicians that such treatment should not be given, except in emergency cases, without authorization by the Veterans Administration Veterans with serviceconnected disabilities, he said, may take treatment from a physician of their own choosing but are urged to obtain authorization beforehand

The authorizing medical officer for the Tomkpins County area is located in Syracuse and should be contacted by the physician on all emergency cases, In issuing prescriptions, members of the society were advised to print the Veterans Administration authorization on the label so that any licensed pharmacist in the State might fill it

Outpatient treatment, he emphasized, is for a service-connected disability only *

Ulster County

The project to erect a suitable building for the establishment of a tumor clinic to serve the people of Kingston and Ulster County was furthered in December when the Common Council, by unanimous vote, passed a resolution granting the use of land adjacent to the city laboratory for such purposes

The resolution was presented by the laws and rules committee, which had taken favorable action on a letter submitted in October by Dr Francis O'Conhor, chairman of the cancer committee of the Ulster County Medical Society, who gave data regarding the proposed clinic, the great need for its establishment and stated that the Board of Supervisors of the county had indicated a willingness to cooperate The necessary land will be made in such a move available when required *

Westchester County

Officers elected at the 140th annual meeting of the County Society are president, Dr Robert B Archibald, of Bedford Hills, president-elect, Dr William G Childress, of Grasslands Hospital, vice-president, Dr Waring Willis, of Bronxville, secretary, Dr Edwin J Dealy, of White Plains, treasurer, Dr Reid Heffner, of New Rochelle

NECROLOGY

Arthur W Benson, M D, 59, of Troy, died on November 20 He was president of the Board of Visitions of the New York State Reconstruction Home at West Haverstraw In 1914 Dr Benson received his medical degree from Columbia University, College of Physicians and Surgeons served on the faculty of the Albany Medical College, lecturing on pediatrics He was a delegate to the White House Conference on Child Health Protection in 1930–1931

OINTMENT I oz. tubes

For application at bedtime

POWDER

2 oz. canisters For daytime use and for prophylaxis

Solution and eintment contain sodium prepienate 16 4% and propionic acid 3.6% Powder contains calcium propionate 15% and zinc propionate 5%

HOSPITAL NEWS

Hospital Council Issues Bulletin

SIX major sections of the Master Plan for guidance in the development of hospitals and related fa-culties are outlined in a bulletin issued December 12 by the Hospital Council of Greater New York.

Dr John B Pastore, executive director, reported that the Plan, based upon a two-year study, will include facts and recommendations concerning (1) physical facilities required, (2) medical education and training, (3) medical research, (4) professional services, (5) evaluation of present facilities, and (6) application of the Master Plan

The Hospital Council was organized in 1938 as a nonprofit voluntary organization to coordinate and improve the hospital and health services of New York City and to plan their development in relation

to community needs

Facilities needed for adequate medical care of the people of New York City should include provision for general hospital care, acute communicable diseases, tuberculous patients, convalescent patients, chronic or long-term illnesses, patients with mental diseases, preventive medicine, and ambulant patients, according to the Master Plan outline

Emphasis is placed upon the continuity of medical supervision and the services required by the people irrespective of their economic status

The Plan includes discussion of services necessary for ambulant

patients and considers the advisability of providing facilities for group practice and offices for doctors

within hospitals

The Council's plan recognizes that responsibility for medical education and training rests mainly on the larger cities, such as New York, and recommends the extension of present facilities to train physicians for practice not only in the city but throughout the country

Studies made of professional services indicate a need for better integration of doctors' services within hospitals and participation by a greater number of physicians in the medical activities of hospitals. The Master Plan will make recommendations for the coordination of professional services for home as

well as hospital care

Discussing the evaluation of present facilities, the outline reveals that many hospital plants in the New York area have been found obsolete and not suitable for modification Others are located in undesirable The Council's studies have or maccessible places considered the changes in population distribution which may result from the City's plans for housing, transportation, recreation and industrial develop-"The ultimate network of hospital facilities must be coordinated with the master plans of the City for other facilities," Dr Pastore said

Cancer Hospital Planned by City

PLANS have been made for a new 300-bed, twelvestory New York City hospital for the treatment chronic cancer patients The hospital will be of chronic cancer patients built on the east side of First Avenue between Sixty-seventh and Sixty-eighth Streets The cost, according to the plans filed with the Department of Housing and Buildings, will be \$2,900,000

Land for the new hospital was donated to the City the Memorial Hospital With Memorial Hospiby the Memorial Hospital tal and the new Sloan-Kettering Institute for Cancer Research now under construction, the City's hospital will be one unit of a center devoted to the study and

treatment of cancer

When the building is completed, some time in 1948, Memorial Hospital will nominate the staff and will also make available to the City institution its treatment facilities Thus the City will be spared the cost of duplicating expensive x-ray treatment

According to the plans, the City hospital will contain laboratories, operating rooms, offices, class-rooms, wards and living quarters for the hospital staff. The offices and laboratories will be on the first floor, classrooms on the mezzanine, and wards and utility rooms on the next seven floors Living quarters will be on the tenth floor, a dining room on the eleventh floor and an apartment on the twelfth A penthouse also is included in the plans

Patients at the City hospital will receive free treat-ent The hospital will primarily receive long-term ironic cancer cases The City now has under con chronic cancer cases struction the Florence Nightingale Hospital at 161st Street and Fort Washington Avenue, which will

treat acute cancer cases

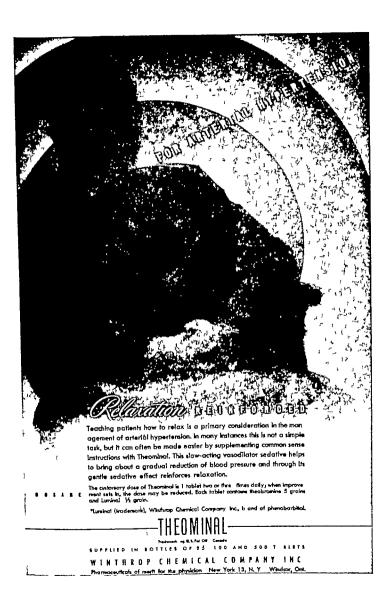

Mount Sinai Lecture Series

SERIES of lectures on recent advances in A therapy is being presented by the Mount Sinai Hospital, New York City

Houston Merritt, chief neuropsychiatrist, Montefiore Hospital, March 5, "Amino

Acid Therapy," Dr Sidney Madden, professor of pathology, Emory University, Atlanta, Georgia, March 19, "Physiological Therapy in Disease of Respiration," Dr Alvan Barath, associate attend ng physician, Presbyterian Hospital, New York City, April 2, "Section of the Vagus Nerves to the Stomach in the Treatment of Peptic Ulcer," Dr Lester R Dragstedt, professor of surgery, University of Chicago, April 16, "The Treatment of Hyperthyroidism," Dr E B Astwood, research professor of medicine, Tufts Medical School, Boston. Boston.

[Continued on page 188]

[Continued from page 186] Newsy Notes

Jefferson County's tuberculosis sanatorium is now entering a new phase of service, as its role in the treatment of general and contagious patients becomes paramount

At present there are 23 tubercular patients in the \$300,000 institution, occupying less than a third of

the 78 beds

Dr Sutherland E Simpson, the superintendent, estimates that the sanatorium is now more than adequate for the needs of four north counties, Jefferson, Lewis, Oswego, and St Lawrence *

Contributions to the Dr R. H Loomis "living memorial fund" drive, which is being conducted by the Business and Professional Women's Club to equip a proposed new children's ward in the Hospital in Sidney, have passed the \$3,000 mark.

The children's ward, according to a release by the Women's Club is to be dedicated as a "living me-

morial" to Dr Loomis, a practicing local physician— The doctor, a native of Bainbridge and a graduate of the high school there, came to Sidney thirty-five years ago after graduating from the Syracuse Medical School, an internship at St. Luke's Hospital in Utica, and brief preliminary practice at a YMCA camp and in Bainbridge

During his long career, Dr Loomis has taken an active part not only in the affairs of the local hospi-

tal, but of the community in general *

A new \$1,000,000 addition to St Clare's General Hospital, on W 51st and 52nd Streets, between 9th and 10th Avenues, New York City, was announced recently by Cardinal Spellman, who is honorary chairman of the advisory board of the Hospital

The new structure, of six floors, basement and sun deck, will be the third addition to St Clare's since it was taken over in 1934 by the Sisters of the Third

Order Regular of St Francis *

St Elizabeth Hospital expansion campaign to raise \$535,000—the amount set as necessary to meet the current pressing need for more beds and increased facilities at the hospital—will be launched January 24 *

The Hospital for the Ruptured and Crippled, New York City, now known as the Hospital for Special Surgery, has come a long way since it was

organized in 1863

It started at 97 Second Avenue when a few children and adults with cerebral palsy were taken into the home of Dr James Knight His interest in cripples had been aroused while he was medical visitor for the Association for Improving Conditions of the Poor

The little hospital in the parlor and bedrooms of that old house was six months old when President Lincoln delivered his Gettysburg address There was not a nurses' training school in the entire United Goats roamed the land at E 42nd Street and Second Avenue, where the hospital is now

The hospital's beginning was an innovation at a time when everybody except a few open-minded physicians believed that most cripples were beyond In those pre-Pasteur, pre-Lister days medical help aseptic surgery had not been developed

Thompson Hospital, Canandaigua, has received a bequest of \$6,000 under the will of Harriet A Dillon. of Shortsville It will be added to the endowment fund, it was announced by President John D Hamil-An additional \$675 was received from the same source, to be used for the purchase of furnishings for three hospital rooms *

In keeping with the progressive educational methods of the nursing profession, the Amsterdam City Hospital has introduced a new "In Service"

program for the graduate staff
The "In Service" program aims to present new
technics and other material of interest in both the professional and nonprofessional fields to interest members of the nursing staff in continued growth both professionally and socially and to intensify an interest in resources of the community

A total of 90 former resident doctors and interns at Grasslands Hospital attended the first Grasslands

Alumni Day reunion since 1941

The day's program started with visiting in open clinics from 10 00 A.M until noon At 1 00 Pu luncheon was held in the staff dining room and during the afternoon from 2 to 4, a scientific program was held in the hospital auditorium surgical progress of the last five years was given by Dr Albert G Rogliano Influenza was the topic of a talk by Dr Reginald Higgons, and Dr Dougla Parker spoke on facial injuries *

The five voluntary hospitals in Suffolk County maugurated on November 1 a forty-hour week for their staffs The institutions are Mather Memorial Port Jefferson, Southampton Hospital, Eastern Long Island Hospital, Greenport, Southside Hospi tal, Bay Shore, and the Huntington Hospital *

With the return of most of its physicians from the armed forces, the Jewish Memorial Hospital in Nev York City announces that its Sterlity and Infertility Clinic, with Dr Abner Weisman as chief 0 clinic, is again in operation. Eligible patients are now being received for diagnosis and treatment The clinic will act in conjunction with the hospital's Maternity and Erythroblastosis Fetalis clinics

A proposal to construct three buildings for some 1,200 continued treatment patients at Kings Park State Hospital, Suffolk County, was approved at the November meeting of the New York State Postwar November meeting of the New York State Postwar Public Works Planning Commission, according to an announcement by John E Burton, State Budget Director and Commission chairman

Using 1940 construction figures as a base, Ross E Sluyter, Director of State Planning for the Commission, estimated it will cost \$2,762,000 to erect the three buildings Present plans call for replacement by the new structures of several buildings now used for continued to the continued to

used for continued treatment patients

On December 21, 1946, the attending staff of Horton Memorial Hospital, Middletown, gave 8 testimonial dinner to Dr Arthur S Moore, FA.C-

HA and FAPA Dr Moore is retiring as superintendent of the Horton Memorial Hospital after eighteen years. He was presented with a silver cigarette case by the staff

Dr Moore has been very active in the Hospital

Councils of this area, and was on the Hospital Ad visory Committee of the Associated Hospital Service (Blue Cross) for the past ten years

After January 1, 1947, he will join the staff of James Hamilton and Associates, Hospital Consult-

Improvements

The monthly night clinic was held December 2 at

Herkimer Memorial Hospital, Herkimer, with Dr Herbert F Schwartz, Pine Crest, in charge Assisting him were Miss Madge E Pierce, chief nurse at Pine Crest, Miss Geraldine Geraghty, Herkimer Hospital technician, Edward Murphy, Pine Crest technician, Miss Mary Bechtold, Herki-mer village nurse, and Miss Louise Palmer, Herkimer school nurse

Arrangements for clinics are made and follow-up work undertaken by Mrs Elsie B Rowlands, county

tuberculosis nurse

A \$43,500 second floor addition to the milliondollar five-story Flushing Hospital and Dispensary The second is now completed and ready for use floor, which will be utilized as the maternity ward, will be opened as soon as the demand for it arises

The new maternity section has fifteen maternity beds, two nurseries and utility rooms and brings the number of beds on that floor to twenty-five There is a total of 265 beds in the entire hospital

are also 108 bassinets for newborns

All the furnishings for the new second floor rooms were donated Two bedrooms were furnished by Branch 7 of the Woman's Auxiliary, Branch 12 of the Woman's Auxiliary and the Junior Auxiliary One bedroom was furnished by Branch 12 of the Woman's Auxiliary and the two four-bed rooms by Mr and Mrs Albert C Wappler and Miss Sara Howatt *

The Chenango Memorial Hospital, Norwich, is undergoing a number of progressive changes in its internal organization and in the many services it offers the citizens of Chenago County, it is announced by Cyrus M Higley, president of the board of directors of the hospital

"The board of directors of the Chenango Memorial Hospital is interested in bringing before the public the facts about the hospital that serves them," Mr Higley stated

Last spring the board of directors engaged a highly skilled firm, Hospital Consultants, of Chicago, Illinois, to make a study of existing conditions at the Chanango Memorial Hospital and to submit a One of the first suggestions made by Hospital Consultants, soon after they arrived in Norwich, was that a new superintendent be engaged

Miss Frieda Dietrichs, R.N., NACHA, whose home is Omaha, Nebraska, was engaged and took

over her duties on July 1

The changes already made or in process are

An early effort will be made to expand hospital association membership to include everyone inter ested throughout Chenango County

The membership fee has been raised from \$1

to \$5

3 The hospital constitution and bylaws are in

the process of being changed

The annual meeting of the hospital association will be held Tuesday, January 28, as suggested, and will be one of the big community events of the year It probably will be held in the Norwich high school auditorium

The public will be informed more completely on the hospital operations through a public relations committee, as suggested Thus correct information and interesting facts will be made common knowl

The board of women managers will continue to function, as a woman's auxiliary, with organization as suggested in the Hospital Consultants

Advisory councils within the medical and nursing staffs will be set up, to assist the hospital

administrator in her work.

The Hospital Consultants' suggestion that the hospital attract the services of additional specialists and additional surgeons who are Fellows of the American College of Surgeons, or the American Col lege of Physicians or licentrates in one of the approved examining boards in their specialties, has been followed *

At the Helm

David L Podell, president of Beth Israel Hospital, at Sixteenth Street and Stuyvesant Park East, New York City, announced on November 20 that the hospital was planning a program of expanded study and research in the field of high blood pressure work will be carried on under the supervision of Dr Arthur M Fishberg, who has been named physicianin-chief of the Hospital *

Dr Sarks J Anthony, of Buffalo, director of the outpatient department of Meyer Memorial Hospital, Buffalo, also will serve as chief assistant superintendent under appointment by the Board of Managers A graduate of the University of Buffalo Medical School, Dr Anthony has been associated with the hospital twelve years *

The most recently appointed member of the Board of Managers of Meyer Memorial Hospital William R Morris, was unanimously elected presi dent of the board on November 26

Members of the Hudson River State Hospital Board of Visitors in Poughkeepsie, honored Dr John R. Ross, returng senior director of the hospital, and Mrs Ross with a testimonial dinner at the Nelson House recently

Benson R. Frost, board member, praised Dr Ross for his contribution to the care of the mentally ill and thanked him for his cooperation with the Board

of Visitors

[Continued from page 190]

Mrs Conger presented Dr Ross a resolution from the board, thanking him for his service to the State and for his cooperation with the Board of Visitors and expressing the regret of the board at his retirement

Other members of the board spoke briefly Ross thanked the board for the honor conferred upon him and he expressed his appreciation for the support the board had given him during his directorship

of the Hudson River State Hospital *

Appointment as resident physician of St Luke's Hospital, Utica, has been given Dr Robert Lewis Griffith, and he has assumed his duties there *

The retirement of Dr L Howard Moss, of Richmond Hill, as chief surgeon of Jamaica Hospital,

Queens, was announced on November 5 Dr Moss has served on the staff of the hospital for forty-three years, joining in 1903 A Queens physician since 1902, he served as president of the Queens Medical Society

He will be succeeded by Dr Joseph D Hallman of Richmond Hill *

Appointment of Dr William Lawrence Gatewood as consulting plastic surgeon on the staff of St Vincent's Hospital, Richmond, has been announced

by Sister Mary Ignatius, superintendent
Dr Gatewood, whose office is in Manhattan, is a member of the American Society of Plastic and Reconstructive Surgery and an active consulting plastic surgeon on the staff of Gouverneur Hospital, Man-

hattan

He is also a fellow of the New York Academy of Medicine and the American College of Surgeons

A well-attended meeting of directors of the Dansville General Hospital, Dansville, with additional members of the medical staff, greeted three leaders in the Council of Rochester Regional Hospitals, Inc., when they visited Dansville on November 11 to discuss a survey of the organization and operation of the hospital These leaders w i Dr Albert D Kaiser, executive director, Dr Paul A. Lembeke, associate director, who had made the survey, and Charles M Royle, business manager of the council*

WOMAN'S AUXILIARY

TO THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

County News

Mrs William Burgess Cornell, Albany County president of the Woman's Auxiliary to the Albany Medical Society, has announced that the midyear Medical Society, has announced that the midyear luncheon and meeting of the Auxiliary was held at the Albany Country Club on Wednesday, December 18 The principal speaker for the event was Mrs Alfred L Madden, President of the Woman's Auxiliary to the State Medical Society who had just returned from Chicago, where she attended the executive board meeting of the Woman's Auxiliary to the American Medical Association. Mrs. Medical Association. to the American Medical Association Mrs Madden's topic was "Relationship Between the County and State Auxiliary "

The second speaker was Mr Robert Barne, director of education services, Albany County Tuberculosis Association, whose was subject "Ways in Which the Medical Auxiliary Can Help the Tuberculosis Education Program."

The guests were Drs Raymond G Leddy, Homer Nelms, Abram L Mann, Alfred L Madden, James W Bucci, and Emerson C Kelly Mrs William G Rightmar was in charge of the program. G Richtmyer was in charge of the program Mrs Alfred Vander Veer 2nd, entertainment chairman, and Mrs James A. Hogan were the hostesses

During the Christmas holidays, as its philanthropic project, the Auxiliary presented four bed-side tables to the Hospital for Incurables Mrs

Emerson C Kelly did the buying and sewing of seventy drawsheets to be presented as the remainder

of the project, at a later date

Plans for the holidays also included the presentation of Christmas gifts to the children and adult patients of the Hospital for Incurables, by an Auxiliary committee composed of Mrs William J Fitzgerald, chairman, assisted by Mrs Philip G Hacker, Mrs Albert M Yunich, Mrs Sheldon Church, Mrs Charles E Stott, and Mrs Louis J DeRusso This committee had also arranged for a New Year's Day Dessert Party for the patients

In accordance with the Auxiliary's plan to keep informed about medical interests, the Albany County Auxiliary had heard the following speakers in 1946 Dr Hugh F Leahy, who spoke on "The Meaning of the Pediatric Survey, and How the Auxiliary Can Help" Dr Leahy is a member of the American Academy of Pediatri-Another speaker was Dr Frank E Coughlin, Albany County District Health Officer, whose topic was "Future Trends in Public Health" The December program included Mr Robert Barrie, director of education services, Albany County Tuberculosis Association, whose topic was "The Tuberculosis Education Program" In January Dr Theodore

CORRESPONDENCE

Psychiatry in Danger

To the Editor

About ten years ago, the interest in psychiatry and psychology began to spread far beyond the trained expert Laymen, movies, radio, magazines, and newspapers began to discuss and to "know" about problems, hidden before from them and reserved to a few specialists. The strange paradox days layed that though these asynctic had appeared. developed that though these experts had spent more years for their training than any other profession, they—and especially the psychoanalysts—were looked upon and joked about as kind of silly phonies who couldn't be taken at all seriously The reason seemed easy to understand as a heritage from a time when psychic life was dominated by magic and animistic thinking, those who dealt with it were sorcerers and magicians. In addition, the joking satisfied the intense need for a defense against unconscious fear of being found out by

"those analysts" While thus the features of the psychiatrist, almost breaking under the weight of the constant and heavy responsibility and overwork, were distorted to figures in comic strips, the fascination for the insane began to skyrocket The war did the rest For this kind of threat to life the individual was not prepared The discrepancy between human psychic organization contra technical mass murder was too much The number of "break downs" of pathologic psychic affliction became spectacular and horrifying The psychiatrist had to move his desk and couch from his office to the battlefront Instead of the concentrated treatment of one dozen daily, he was confronted with the task of doing something with thousands in need alarm was given from highest quarters. Our best psychiatrists, conscious of their medical as well

as ethical responsibility, cried out for mass training of experts? But how to bridge the necessary training time of twelve years or more? How to create out of nothing other 5,000 to 10,000 psychiatrists? The method seemed simple One had only to drop the level, train physicians by some lectures in courses of a few months, have psychiatric social workers open "practices", have psychologists open "advisory" offices

The danger of such a development and its challenge to the medical profession cannot be exaggerated What actually happens now is the elimination of psychiatry as the most complex, most responsible, most difficult medical specialty Instead it has become a kind of fashionable sport or exciting entertainment for lay people The problem of insufficient psychiatric care grasps our young college students not with the spirit of an ethical dilemma, confronting the nation, but it is experienced with sensational fascination as a kind of snobbish epidemic Beside the mercenary aspect (all psychiatrists are millionaires) it is the glamor of the psychiatrist as a social being, full of power and mystery, that induces these young men and women to enroll in superficial psychologic studies After a year or so, they begin to "analyze" and treat their neighbors

The attraction goes especially to women—to those in particular to whom nature has denied the assets of bodily attraction. They make up for it by compensating their inferiority through a profes-

[Continued on page 198]

^{* &}quot;Results of Treatment of Psychoneuroses by the General Practitioner," Peter G Denker, M D, Oct. 1, 1946, page

[Continued from page 194]

sional work that gives them a superior position

An article in this Journal* proving that the general practioner's results in treating neuroses are as good as the results obtained by psychiatrists was presented at the New York Academy of Medi-cine The audience of physicians felt highly amused They roared in laughter Almost nobody seemed to realize the earnestness of a challenge which repudiates psychiatry and denies its outstanding rights as a most serious specialty of medicine Such a paper will back up the physician's and the public's distrust of the expert Psychiatry becomes everybody's lusty hunting ground

The results of this development will be twofold First, the door is pushed wide open for dilettantism The popularization of science, especially of medicine, is a good thing as long as the layman remains in the role of an interested spectator. However, at the moment where he begins to take a dare by actively "analyzing" himself whomever he happens to come across, the possibility of danger becomes It means not only the possibility that organic diseases of the nervous systems might be unrecognized and overlooked, it is rather the explosive potentiality immanent in every mental and emotional ailment which, wrongly handled, might create eventually a most detrimental damage It is not the arrogance of the scientist and expert which demands a strict and clean hands-off program It is the dictate of responsibility which we have to carry, to see to it that this most delicate problem of medicine does not slip into the unskilled hands of the broad masses

If we let this happen, if we allow psychiatry to become a kind of everybody's mental football game, the other result—besides the damage to our patients—will be a reaction in a few years which will be even more disastrous than anything before The pendulum always swings back. Psychiatry, just emerged as a new, essential part of medicine of broadest implications, will be abandoned and rejected by the public just as quickly and passionately as it has been taken over—It was always like that—The more violent a curve of interest rises, the deeper and faster it is doomed to fall

The problem of how to deal with the disastrous increase of mental diseases cannot be solved by giving it into the hands of the people. The free-for-all attitude spells disaster. To put it into the lap of the general practitioner would be a possible solution, if, through postgraduate courses, these doctors would be taught not only the basic psychiatric approach to somatic ailments, but simultaneously the point where they have to stop and leave the work to the trained psychiatrist. It is this knowledge of the potentialities and limitations which we have to convey to them, it would ease the psychiatrist's burden by relieving him from the treatment of superficial emotional disorders while the deeper anxieties and their defense organizations definitely have to be reserved for him mean the training of the doctor's judgment and his professional character, his sense of responsibility and eventually self-denial by recognizing his limitations in cases where his professional vigor and vanity might have to be frustrated

Still, the ultimate approach to the dilemma lies in a different direction In accordance with Canada's wartime Surgeon Gen B Chisholm, the psychiatrist and psychoanalyst should give up his behavior as a mystery man The public, anyway, being inclined to separate the "soul" as a quite hazy metaphysical part from the remainder of the patient, should be enlightened in the broadest possible way about the realistic aims of the psychiatrist on the one hand, and about the nature and mechanisms of mental and emotional disturbances on the other The mass movement of psychiatric interest must be robbed of its sensa-tional connotations and channeled back to the psychiatrist's personal leadership Popularization of scientific issues should be done only by the expert himself, only if it is in his hands, can we expect a real help in an otherwise hopeless problem

> Eric P Mosse, M D 57 West 57th Street, New York City

October 28 1948

To the Editor

One can only agree with Dr Mosse's concern about psychiatrists and psychoanalysts being looked upon as "silly phonies," although his rather pro-found psychoanalytical interpretation as to the cause of this reaction seems a bit oversimplified It is quite easy to assume that "the joking satisfies the intense need for a defense against unconscious fear of being found out by 'those analysts', one cannot avoid a strong suspicion that statements of this type are rationalizations in themselves In order to command the serious respect of physicians and intelligent individuals in other spheres of life, such glib generalities are not too impressive Personally, I feel the problem hes deeper than Dr Mosse conceives Is it not important in the comparative suspicion of psychiatry, that psychiatrists and psychoanalysts have, for the past ten or more years, been attempting to "oversell" their product to the public? How scientific has their approach really been, and who has actually been doing all of the speaking before laymen, radio audiences, and the psychologically hungry social service workers? Has not there always been an innuendo, with all their verbal barrage, of infallibility associated with the psychiatric and psychoanalytical procedure? The customary humility of the scientist in critically evaluating his therapeutic results has, unfortunately, been absent in the popular smoke-screen, spread on very slight provocation by these men, and if they are concerned at present with the boomerang effect on the part of the public, the answer, it would seem to me, would be to return to the fold of scientific medicine. Reverse the ratio of tea party and popular magazine articles, and present your results to physicians in an honest, critical manner After all, they are in a better position to judge such results than the lay groups, and although no one expects omnipotence in the analysts, it would come more graciously to have them speak occasionally of their failures, instead of one case that had achieved a successful outcome after two or more years on the couch

It was with such an idea in mind that I thought it of interest in my article to compare the results of treatment, in severe neurotic conditions, by the general practitioner, with those of psychiatrists, psychoanalysts, and psychiatric institutions Personally, I feel that more such comparative studies and larger series of controlled cases are necessary

8 OUT OF 9 MIGRAINE PATIENTS COMPLETELY RELIEVED BY NAOTIN

 \diamondsuit_{λ} (75% success in all lyfies of headache treated)

A recent report! on the treatment of 100 cases of severe headache, including migraine, emphasizes the clinical value of NAOTIN * Closely following the characteristic flush afid heat sensation due to the peripheral dilatation produced by a 100 mg. dose, given intravenously, complete relief of headache was achieved in 75 cases, and partial relief in all but three of the remaining \$25\$ cases.

In other types of headache, as vell, the authors obtained "excellent results" with NAOTIN All 13 patients with post spinal-tap headaches were completely reheved, as were 42 out of a

group of 57 idiopathic cephalalgias Side effects were minimal and infrequent, and recurrences were noted in only 22 patients

A clinical trial will prove the value of NAOTIN in your own practice. For further detailed information write to the Medical Service Department, The Drug Products Co, Inc, Passaic, New Jersey t Geldricher and Poetic, Janua 111 103 1949

Tarbonis

All the Therapeutic Value of Tar in an Odorless, Greaseless, Non-Staining, Non-Soiling, Vanishing-Type Cream

When secondary infection is not a complicating feature, Tarbonis remains the method of choice for the treatment of the many skin lesions known to respond to tar. It provides 5% highly active liquor carbonis detergens, together with menthol and lanolin, in a greaseless, odorless, stainless vanishing cream base. Tarbonis is specifically indicated in eczema (including the infantile and atopic varieties), psoriasis, ringworm, occupational dermatoses, follicultits, seborrheic dermatitis, intertrigo, pityriasis, varicose ulcers, contact dermatitis, lichen planus, ulcus hypostaticum.

THE TARBONIS COMPANY

4300 EUCLID AVENUE . CLEVELAND 3, OHIO

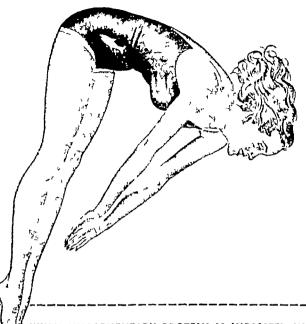

Sul-Tarbonis

A Rational Combination, Effective in Many Heretofore Intractable Skin Conditions

Sul-Tarbonis combines the well-established therapeutic efficacy of Tarbonis (Liquor Carbonis Detergens 5%) with the proven antibacterial actions of sulfathiazole (5%). It thus provides a rational effective means of treating impetigo contagiosa, chronic infectious eczematoid dermatitis, infected varicose and other chronic ulcers, infected tinea corporis and pedis, pyoderma, and all other types of infected cutaneous lesions. As emphasized by Kenney et al. (Kenney, E. L., Pembroke, R. H., Chatard, F. E., and Ziegler, J. M. Sulfathiazole Ointment in the Treatment of Cutaneous Infections, J. A. M. A. 117 1415. (Oct. 25) 1941), this combination of sulfathiazole and liquor carbonis detergens (in ointment form) combats not only the underlying dermatologic lesion but the secondary infection as well

Physicians are invited to send for literature and clinical sample of both products

WHEN SUPPLEMENTARY PROTEIN IS INDICATED IN

Reducing Diets

K NOX GELATINE is especially valuable when you must plan reducing dists containing supplementary protein.

Knox is pure, unflavored gelatine that is all protein, no sugar.. decidedly different from factory-flavored gelatine dessert powders which are 85% sugar

To all reducing diets, Knox Gelatine salads and desserts can add variety and interest. Many of these dishes contain high-residue low-calorie foods, especially helpful in staving off hunger

Drinking Knox in water or in diluted fruit juices between meals is another good, low-calorie way to combat hunger and make dieting easier

If You Wish FREE Diets and Recipes write to Knox Gelatine, Johnstown, New York.

SUGGESTIONS FOR CONTRIBUTORS TO THE NEW YORK STATE JOURNAL OF MEDICINE

The New York State Journal of Medicine asks its contributors to follow the suggestions listed below in the preparation of their articles way they will greatly facilitate the expeditious publication of the JOURNAL. These suggestions have been devised in order to save correspondence, avoid return of papers for changes, minimize the work of preparation for the printer, and save the high costs of corrections made on galley proof

Size of Articles -It is earnestly desired that scientific articles shall not exceed 6 JOURNAL pages at the outside Longer articles tend to lower An average of five or six seems to reader interest be the most desirable from this point of view Cal-culation can readily be made by multiplying the number of double-spaced typewritten manuscript pages by the fraction two-fifths, e g, twelve manu-

script pages will make five Journal pages

Manuscripts.—Papers must be typewritten on one side only of white sheets consecutively numbered, and be double spaced with one-inch margins They should be prepared with great care so as to be typographically correct. All headings, titles, subtitles, and subheadings should be typed flush with the left-hand margin. This is imperative for rapid and accurate composition by the printers

Titles —The title should be brief and typed in capital letters The subtitle can be longer and should be typed in caps and lower case letters Under the title, or subtitle, if there is one, should appear the name of the author and city in which he lives Directly under his name should be the hospital or institution with which he is affiliated

Subheadings —Subheadings should serted by the author at appropriate intervals

References —It is the unfailing practice of the NEW YORK STATE JOURNAL OF MEDICINE to use specific "references" rather than "bibliography" There should appear in the text reference numbers, typed above and to the right of the word to which there is a reference A list, consecutively numbered, of these references should follow at the end of the manuscript (Note that spelling in list is same as in text) The arrangement should be as follows and should include all items

Books-author's surname followed by initials. title of book, edition, location and name of publisher, year of publication, volume, and page number Thus, Osler, W Modern Medicine, 3rd ed., Philadelphia, Lea & Febiger, 1927, vol. 5, p 57

Periodicals—author's surname followed by

initials, name of periodical, volume, page, month (day if necessary), year of publication Thus, Leahy, Leon J New York State J Med 40 347 (March 1) 1940

The Journal does not include titles of Note articles

Case Reports -Instead of abstracts of hospital histories, authors should write these reports in a narrative style with properly completed sentences All unimportant details should be deleted with such general negative statements as fit the case

Tables -- While tables are very useful on lantern slides in the reading of papers, they fail of this purpose to a large extent in the printed page that reason it is urged that they be reduced as much as possible to descriptive language

Illustrations -These should be kept to the minimum necessary to make clear the points to In some instances be registered by the author they are imperative to proper understanding, in others they are merely picturesque. The latter can be excluded to good effect, both as to space

and the not inconsiderable cost

When illustrations are to be used they should accompany manuscripts and each should always be referred to in the text, preferably by number Drawings or graphs should not be larger than 12 × 16 inches, and must be made with jet black India ink on white paper Do not use typewriter for The smallest lettering on 8 × 10 inch copy should be no less than 1/4 inch high. Cross-section paper (white with black lines) may be used, but should not have more than 4 lines per inch finer ruled paper is used, the major division lines should be drawn in with black ink, omitting the finer In the case of finely ruled paper, only blue-lined paper can be accepted Lettering and all markings must be large enough to be readable after reduction Mail rolled or flat, never fold. Photographs should be very distinct and show clear black and white contrasts They must be on glossy

white paper Avoid round and oval photographs
Whenever possible "crop" photographs, 1e,
mark portion that can be excluded when reproduced Crop marks should be on margin of photographs. Do not run pencil lines through photographs graphs

It is important to mark the top of the illustration on the back, also its number as referred to in the text, thus, Fig 1, 2, and the name and address of the author

Legends should be typewritten on one sheet of paper and attached to the illustrations

KOROMEX JELLY

- Fastest Spermicidal Time
 measurable under Brown and Gamble technique
- Proper Viscosity for cervical occlusion

The new, convenient "two-day" endocrine treatment of secondary amenorrhea with PROMETRON offers therapeutic simplicity. Where formerly ten separate injections of hormones were required each month over a long period now one injection of PROMETRON (combined estrogen and progesterone) on each of two successive days induces uterine bleeding simulating menses in approximately four out of five women.

PROMETRON

PROMETRON consists of PROGYNON-8 (alpha-astradial benzoate) 2.5 mg and PROLUTON (crystalline progesterone) 12.5 mg in all combined in a single i ampule PROMETRON injections may be administered at any time of the month. Best results are obtained in cores of less than two years duration. Therapy should be repeated monthly.

PROMETRON: 1 cc. ompules in boxes of 2 ampules Also in economy packages containing 3 boxes of 2 ampules each

RESEARCH IN THE SERVICE OF MEDICINE

Promising starlet Dub!

HER dietary sin is one of omission. To keep her figure slender, she abstains from many nourishing foods. The result is an old story—a further increase in the incidence of borderline vitamin deficiency. Equally familiar are the other chapter heads of that story indifference, excessive smoking, alcoholism, meals abbreviated by pressure of business, and dislikes for certain protective foods, to name but a few. In all of the instances suggested, after prescription of a corrective diet, a dependable vitamin supplement may well be in order. For this you'll find Dayamin capsules especially well suited. Each easy to take, gay red capsule supplies several times the minimum daily requirement for adults of vitamins A, B₁, C, D, riboflavin and nicotinamide, and also pantothenic acid and pyridoxine hydrochloride. Your pharmacy is stocked and ready to fill your prescription for Dayamin today. In bottles of 30, 100, 250 and 1000 capsules. Abbott Laboratories, North Chicago. Illinois

ABBOTT'S MULTIPLE VITAMINS

In treating Para-nasal Infection

achieve

Decongestion without rebound

The rebound congestion that follows the use of many vasoconstrictors creates a vicious circle that prevents normal function of the nasal passages.

ARGYROL provides decongestion and bacteriostasis in addition to its cleansing and demulcent properties and hastens the return of normal function

ARGYROL is decongestive without irritation to the membrane and without ciliary injury

ARGYROL is powerfully bacteriostatic yet is non toxic to tissue

3 ARGYROL stimulates secretion and cleanses, thereby enhancing Natures own first line of defense

Three-Fold Approach to Para-nasal Therapy

1 The nasal meatus by 20 per cent ARGYROL instillations through the nasolacrimal duct.

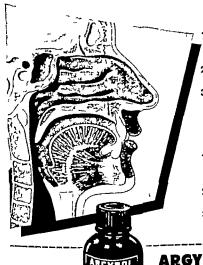

The nasal passages with 10 per cent ARGYROL solution in drops

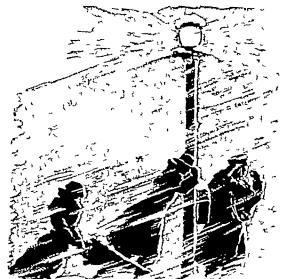

The nasal cavities with 10 per centargyrolbynasaltamponage.

ARGYROL the Physiologic Anti-infective with broad, sustained action

Mode any A. C. BARNES COMPANY NEW BRUNSWICK, N. J.

ARGYROL is a registered trade mark, the property of A. G. Bernet Company

THE season of throat affections is here

Thantis Lozenges have proved especially effective in soothing and relieving these conditions. The effectiveness of Thantis Lozenges is due to two active ingredients.

Merodicein* an antiseptic which prevents the development of bacteria even in great dilution

Saligenin† a mild local anesthetic which relieves the discomfort of throat infections

Thantis Lozenges are antiseptic and anesthetic for the mucous membranes of the throat and mouth Complete literature on request.

Supplied in vials of twelve lozenges each

- * Merodicein is the H W & D trade name for monohydroxy mercuridilodoresorcinsulfonphthalein sodium
- † Saligenin is orthohydroxybenzylalcohol H W & D

HYNSON, WESTCOTT & DUNNING, Inc. Baltimore 1, Md.

penetrating

stable

intranasal antibiotic Quicker acting, more penetrating and more stable than penicillin is tyrothricin, the nontoxic antibac terral principle of 'Prothricin' Antibiotic Nasal Decongestant. Applied locally, tyrothricin promptly attacks bacteria, and its low surface tension promotes penetration of tissue crevices and mucosal folds

Moreover tyrothricin maintains antibiotic efficiency even in the presence of pus or mucus, and since (unlike penicullin) it is sparingly absorbed, local ac tivity is prolonged

In addition to tyrothricin (0.02%), 'Protiricin' Antibiotic Nasal Decongestant contains an effective vasoconstrictor Propadrine hydrochloride* (1.5%), to help re-establish normal drainage without the unpleasant side-effects characteristic of ephedrine and its analogs

Isotonic with normal nasal secretions, buffered in the physiologic pH range of 5 5.6 5, 'Prothricin' de congestant is clear and free flowing does not impair ciliary function, and (unlike sulfonamide suspensions) does not form mucosal crusts that may block drainage.

Finally Prothricin' Antibiotic Nasal Decongestant is stable, retaining full antibacterial potency indefinitely at room temperature. This unique preparation is indicated in the local treatment of sinusitis, rhinitis coryza and nasal congestion.

Supplied in 1-ounce, dropper assembly bottles

sharp & Dohme Philadelphia 1 Pa

*Council-Accepted

anlibiolio nasal decongestant

CCThe sulfonamide drugsgiven orally are recognized
as the most valuable single
therapeutic measure

in severe infectious sore throats."

Weille, F L. M Clin. North America 28 1115

Eskadiazine...

SKF's fluid sulfadiazine for oral use is particularly indicated for patients with painfully inflamed throats because

Esladiazine
is so much easier to swallow
than bulky half-gram
sulfadiazine tablets

Eskadiazine
is so outstandingly palatable
that even infants and children
actually like to take it

Eshadiazine
is so quickly absorbed
that it provides desired serum levels
3 to 5 times more rapidly than tablets

Smith, Kline & French Laboratories, Philadelphia, Pa

Why Premarin"
in Menopausal Therapy?
Because it is Orally Effective
Rarely elicits Toxic Reactions
Produces rapid
Symptomatic Relief

"Premarin"

is a naturally

occurring conjugated estrogen which is therapeutically effective when administered by mouth it usually produces prompt remission of distressing symptoms and provides an emotional uplift and feeling of well being which is gratifying to the patient.

Toxic effects or even minor unpleasant side reactions are relatively rare

Available as

Tablets of 1.25 mg — bottles of 20 100 and 1000

Tablets of 0 625 mg — bottles of 100 and 1000

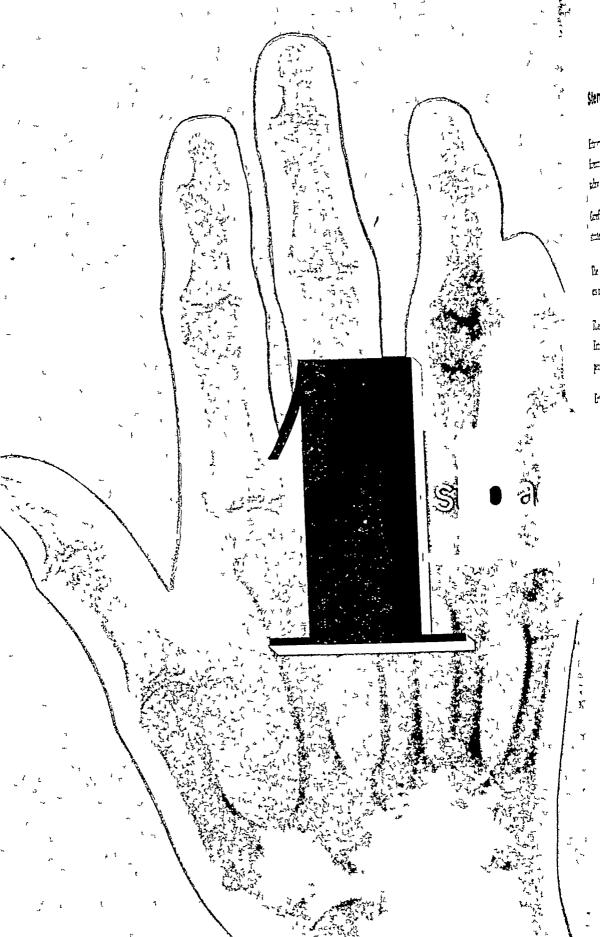

A palatable liquid—containing 0 625 mg in each teaspoonful (4 cc.) in 4-ounce bottles.

Conjugated estrogens (equine)

Ayerst, McKenna & Harrison Ltd.

Sterold Therapy with Ertron-Sterold Complex, Whittier

Ertron-Steroid Complex, Whittier-is foremost in the treatment of arthritis today

Carefully evaluated results have demon strated its clinical effectiveness.

The twelve-year clinical background covers many hundreds of cases.

The unique chemical composition of Ertron accounts for its distinctive thera peutic effect.

Ertron differs from all other products

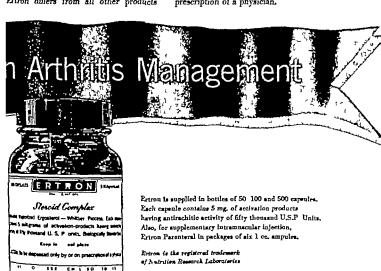

used in the management of arthritis Ertron contains previously unidentified steroids which have been isolated and which establish its chemical uniqueness and steroid complex characteristics.

Ertron is specified on prescription more than any other product for arthritis.

Ertron is ethically promoted.

Physician control of the arthritic patient is essential for optimum results. Ertron is available to the patient only upon the prescription of a physician.

FORMULAO Infant Food provides a balanced and flexible formula basis for general infant feeding — both in normal and difficult diet cases.

Developed by E. V McCollum, Formulao is a concentrated milk in liquid form fortified with all vitamins known to be necessary for proper infant nutrition. No supplementary vitamin administration is necessary with Formulao. The Vitamin C content is stabilized, assuring greater safety.

The only carbohydrate in Formula is the natural lactose found in cows milk—no other carbohydrate has been added. This permits you to prescribe both the amount and the type of carbohydrate supplementation required.

FORMULAC is promoted ethically, to the medical profession only Clinical testing has proved it satisfactory in promoting normal infant growth and development. On sale in grocery and drug stores throughout the country, FORMULAC is priced within tange of even modest incomes.

Biennial Registration of Physicians Important Notice

About 5,000 physicians in the State of New York have not, as of January 1, 1947, completed their registration as required by law

We call to the attention of all physicians of the State of New York the fact that been cannal registration was started two years ago and this year (1947) all physicians are required to register, that is, the two-year period for those who registered before will finish this year and for anyone registering for less than the two years, registration would terminate this past January

This means all physicians should have registered before January 1 for the years 1947-1948 The notices were sent out by the Department of Education in early October, 1946

The law requires that a physician register on or before January 1 The Department is required by law to charge an additional fee for any registration that comes in late. The minimum fee that the Department can charge by law is \$100 per month. It increases from that up to \$500 per day for every day of practice if the evidence is that the physician willfully refuses or omits to register 1

The physician is not excused if he did not receive his registration form which was sent out by the Department of Education. The Department is not required to notify the physician that he has not registered.

We urge all physicians to check with the Department of Education immediately to verify their registration, also to spread this information to their colleagues

There is no exemption in the law for veterans nor does the Department have the right to set aside or exempt a person from the additional fees or fines specified in the law

¹ See Handbook, Section 1960 paragraph 6.

Ordinary Human Decency

Some time ago, we read an article called "Preventive Psychiatry" It was one of the most shocking chronicles of man's inhumanity to man that has ever come to our attention. It was written by two psychiatrists. Psychiatry is a young and tender plant, and it was probably their wish to seem as detached and impersonal as possible, which may account for the freezing temperature of their style.

"The effective combat life of the average infantryman appears to depend largely on how continuously he is used in combat" It would seem obvious that if a man is not in combat he is not as likely to be killed as if he But that is not what the authors They were trying to interpret the meant amount of sustained terror that the average man can stand in terms that they hoped might be understandable to generals British, for example, estimate that their riflemen in Italy will last about four hundred regimental combat days, about twice as long as US riflemen in the heavily used US divisions in Italy "They attribute the difference to the policy of pulling infantrymen" (we doubt if much pulling was necessary) "out of the line at the end of twelve days for a rest of four days" The authors state that the Americans kept in the line without relief usually twenty to thirty, frequently thirty to forty, occasionally eighty days, wore out at the end of two hundred to two hundred and forty aggregate combat days Actually, the line officers were emphatic in stating that the limit of the average soldier was considerably Most men, they stated, were meffective after one hundred and forty to one hundred and eighty days

At the conclusion of the article, the

authors state that the "possibility that psychiatry can contribute to the mental health of the population by recommending environmental changes involving policy and procedures in industry, education, and elsewhere bears further study" We commend the authors for one of the greatest masterpieces of understatement we have ever read

And, yet, it is quite of a piece with the general American attitude toward life. If you aren't going about your business at a dog trot, with your tongue hanging out and your collar wilted, you don't look busy. And if you don't at least look busy—why—you must be a failure.

John Hunter was always held up to us as a great man He had high blood pressure and remarked that his life was at the mercy of any damned fool who chose to make him angry He died in a fit induced by an argument with a stupid hospital trustee

Well, we come in contact with damn fools every now and then But we are not going to let them make us angry—much not going to spend our lives in the way that the High Command spent the lives and exhausted the nervous systems of the combat infantrymen in Italy—even in the face of the British beside them who lasted twice as long by pulling the men out to rest every twelve It seems to us unnecessary to write of days such things under the heading of psychiatry Why wouldn't ordinary human decency do as well? Any man who treated a tank or a mule like that would be severely punished Yes, we know the meaning of the word "ex-" pendable

We are at least firm in one resolve We are not going to be killed in the typical American way—crossing the street against the lights to catch a bus that isn't there

The Drug Encomiast

How many morphine addicts there are in this country we do not know, nor would it matter greatly if we did What we do know is that there was an impression firmly established in both professional and lay minds that morphine, while in certain cases it is one of God's great gifts to man, is in general a dangerous, habit-forming drug, and that its victims are among the most wretched of the inhabitants of this earth

We were, therefore, more than somewhat surprised when some time ago a nationally

¹ Appel, John W., and Beebe, Gilbert W. J.A.M.A. 131, 1469 (Aug. 31) 1946

and internationally known digest magazine, boasting a prodigious circulation, published an article by a well known author extolling the virtues of a new drug, Demerol, as being in every way a substitute for morphine and nonhabit-formina

Since its appearance, there have appeared articles, pro and con, in both the professional

and the lay press

The same writer is also the author of a book praising the qualities of testosterone proprionate, the male sex hormone, as the contemporary equivalent of the Fountain of Youth.

We think it important, therefore, to reprint an excerpt from a pamphlet sent to us by the Winthop Chemical Company, the manufacturers of Demerol Its language is restrained, but its meaning clear think, coming from the manufacturers of the very drug in question, the evidence is unimpeachable.

Warning May Be Habit Forming

Clinical research on Demerol hydrochloride indicates that when it is administered for relief of pain in amounts not in excess of 150 mg every three hours, habituation, and physical dependence on the compound are not likely to occur However, the medication should be used with caution inasmuch as in the absence of pain, physical dependence has been produced experimentally in former or active morphine addicts when daily amounts in excess of therapeutic dosages were administered for prolonged periods of time (upwards of two months)

251

The writer of these articles, this drug encomiast, we picture as a grizzling giant. a senescent Bernarr McFadden, in his one hand a hypodermic of testosterone proprionate to prolong his pleasures, in the other, one of Demerol to ease his pain.

Both remedies may have worked with him personally, but we would remind this ageing gander that what may be sauce for him is not necessarily wholesome fare for the general public. We also question what might well be called the morality of an editorial policy that advertises a painkiller to the public at large (See also issues of the Journal of the American Medical Association. September 7 and 8, 1946)

The New Subversion of Sickness

The JOURNAL said editorially in September that good modern medical service was senously threatened by the possibility of interruption to the necessary flow of "ancillary services and things which the working medical profession now needs in order to function. " It said further that "Everybody's business is nobody's business medicine is the business of the working medical profession seven days a week, 365 days a year, year in and year out Don't forget that fact It is important to the national health. And the health of every individual taxpayer is an important part of the national health. That national health is threatened by whatever threatens the continuous flow of medical services, by work stoppages in critical industries, by failure to produce the things that people need, that the working medical profession must have in order to function, by excessive prices for medical service occasioned by badly controlled cost in relation to volume of goods or service pro-

bers of Local 274-B of the pipe fitters' union in New Jersey had no intention of creating such a catastrophe in New York City hospitals, no matter what the cause was for which they struck. Nevertheless, it is to be anticipated that secondary results of this kind will of necessity accrue as a by-product

are poor economists, but even a poor economist can see that " On October 15, the New York Times (page

duced as they relate to the creation of medi-

cal service. Doctors may be and probably

1) reported that

Because a strike has stopped production of oxygen for New York's twenty-six city hospitals these institutions face a crisis this morning that will "cost more than 100 lives a day," Commissioner of Purchase Albert Pleydell said last night.

Before the strike began last Saturday in the plant of the American Oxygen Company, Harrison, N.J., the reserve supply of oxygen in the city's hospitals had been reduced by the trucking strike This morning it will be exhausted

It is fair to assume that the striking mem-

without neostigmine Earlier employment of this drug would appear desirable

Congenital Hypertrophic Pylonic Steno-The questions of when to operate on cases of congenital hypertrophic stenosis, and what cases can be cured with medical treatment are always pertinent and may at any time face the general practitioner The surgical mortality of 5 to 8 per cent previously reported, and the failure of some cases to respond satisfactorily to medical treatment, show the need of a classification of cases to determine if and when the treatment should be surgical Of equal importance is the selection of cases that can be cured by medical treatment criteria for selecting individual cases for medical or surgical treatment were stated by Jacoby in 1944, in a report of 26 cases, with a mortality of 8 per cent With the added experience gained during

the past years (and a slight change in the criteria), Jacoby¹ now reports his results in 50 consecutive cases of congenital pyloric stenosis, with mortality at zero. Of the total 50 cases, 24 were treated surgically and 26 received medical treatment—all without a fatality. The following are his criteria for selecting the method of treatment in in-

dividual cases

Indications for Surgical Treatment

- (a) Vomiting beginning in the second week or earlier
- (b) Severe dehydration

2 Contraindications to Surgical Treatment

(a) Infection

(b) Diarrhea
Indications for Medical Treatment

- (a) Vomiting starting in the fourth week or later
- (b) Vomiting continuous for three weeks or more before the infant is first seen, provided it is not severely dehydrated
- Contraindications to Medical Treatment
 - (a) Severe dehydration

(b) Hematemesis

The basis of his treatment of medical cases is a diet small in amount but concentrated—not diluted—and atropine methylnitrate He lays emphasis on six points (1) certain diagnosis by finding a "palpable pylone tumor", (2) select case on basis of criteria, (3) feed undiluted milk (breast milk preferred), one ounce every four hours for infants under 6 5 pounds, and 1 5 ounces for infants over 6 5 pounds, (4) atropine methylmtrate (0 6 per cent in alcohol), four drops into the back of the mouth (give four doses, fifteen minutes before feeding, the first day, three doses the second day, and when vomiting stops continue atropine three times a day for sixteen weeks), (5) wash stomach only in cases with a large amount of mucus in vomitus, and (6) give no parenteral fluids by any route Need of hydration is an indication for prompt operation

Of the 50 cases he reports, 50 per cent of them were being fed artificially when medical advice was sought. This is unfortunate and the result of a mistaken belief that the breast milk was the cause of the vomiting. The author emphasizes the importance and the benefits of breast feeding in cases of con-

genital pyloric stenosis

046

As this issue of the Journal goes to press, we regret to announce the sudden death in Utica on January 16 of Dr William Hale, President of the Society A more extended memorial will be published in the next issue of the Journal

OPERATIVE TREATMENT OF CLUB FEET

JOHN C McCAULEY, JR., M.D , F A.C S , New York City

(From the New York Orthopedic Dispensary and Hospital)

In the treatment of club feet, the most frequent problems are furnished by the so-called common, or first type. These feet usually are unassociated with other congenital deformities, obvious neurologic disturbances, or bone defects

This discussion, in the main, is concerned with this type of foot rather than the unusual variety, which by their more profound character will sconer or later demand some type of surgical treatment.

The common type, however, shows consider able variation in response to the same general measures of treatment, and this variation from a practical standpoint results in our having to deal with two more or less definite patterns. The first are feet which respond satisfactorily as to correction—satisfactorily as to the length of time necessary to obtain correction, and satisfactorily in maintaining that correction once it has been attained

The second are feet which do not respond in such fashion and eventually become classified as chronic, recurrent, or inveterate deformities.

If, from a statistical viewpoint, we conclude that bone resection and arthrodesis at a later age is the best operation for recurrent, chrome, or inveterate club foot deformities. I believe that by so doing we must either indict these as instances of congenital tailpes as extremely serious and difficult problems, or their previous treatment as inadequate

Some years ago, it was much easier for me to think that recurrent, chronic or inveterate club feet were feet in which the initial measures of treatment had fallen short of proper standards I am still of the opinion that this is true in many instances, where initial treatment has been interrupted or applied without complete knowledge of the task at hand. We see such feet quite frequently but these remarks are concerned with the group of feet which are difficult problems from the first, or early period of their existence and where more or less faithful and constant effort has failed to produce either satisfactory overcorrection, or to maintain ground once gained Often there is failure to maintain gains that have been reproduced time and again.

What additional measures can operative treatment offer these cases, and is their surgical help of value or permanence during the more or less orthodox period of conservative attack?

Presented at the 140th Annual Meeting of the Madlesl Society of the State of New York, Section on Orthopedis Surgery May 2 1946.

I believe there may be help from this direction and that its employment in no way calls for any sweeping revision of common sense methods of conservative treatment. Fortunately, this group of recalcitrants is comparatively small, but their behavior is of such a definite pattern of persistent resistance, or recurrence, that more or less general rules can be laid down for the application of surgical assistance.

Standards of Correction

The basic law in the treatment of club feet is to obtain overcorrection of the deformity. The interpretation of overcorrection must not depend on clinical appearance. A ray verification is necessary. Overcorrection, then, must be maintained for a sufficient period so that no significant return to the original attitude occurs when the restraint is removed. This sounds simple, but far too often it is not simple, either as to its execution or as to its full attainment. Then, too, its literal application to the group of feet under discussion would mean virtual extinction of physiologic function for an indeterminate period.

To cite an example.

In a child at the age of 6 years and 7 months, retentive dressing had been applied a total of three years and the child had failed to report during the last two years of the total ago period. Heal cord tenotomies and posterior capsulotomies, which had been advised at the age of nine months were refused until the child was 61/1 years old. After such oper ations had been performed, the feet remained fairly good for three years, with recurring equinus in the forefeet rather than at the ankles, and one foot requiring additional surgery with a subtalar arthrodesis at the age of ten years. The original note describing those feet at cleven days of age stated that the deformities were extreme in all elements, but the feet were flexible and could be corrected even the equinus. This child was reported as showing no neurologic abnormalities at the age of three to four years. The handwriting on the wall appears in the early treatment history Retentive dressings for the initial seven months of life were followed by prompt recurrence after short recesses. A subsequent three months recess was followed by retentive dressness for fourteen months, and so on.

Such cases certainly are not an indictment against conservative treatment, but to my mind, demonstrate the obstacle marathon that exists in the "run of the mill" treatment of club feet.

No matter how convinced one may be that the answer to success is the diligent application of

a well-defined program of treatment, he will always have the problem of inveterate club feet, due to circumstances beyond his control. This is true far more often in clinic than in private practice.

There is no sure method of treatment by which these difficult club feet can be made to respond consistently and satisfactorily The present vogue, the Dennis-Brown splint, is an ingenious and sound device and may in time prove helpful in reducing the number of our inveterate prob-The Dennis-Brown splint, however, is subject to the same limitations and uncontrollable factors as any other form of treatment, and its widespread use in many hands will not eliminate unsatisfactory results Numbers of new admissions to the Club Foot Clinicat the New York Orthopedic Dispensary and Hospital, with previously treated but incompletely corrected feet, give the history of the Dennis-Brown splint being used in their early career One of the clinics, from which emanates a report of complete satisfaction by its use, hospitalizes all its patients immediately after birth where the application of the splint is under constant and meticulous supervision for a number of months This is an excellent way to effectively apply any type of treatment, but, unfortunately, for most of us it is impractical

Correction of Equinus

In discussing the various aids by surgery, we come first to the element of equinus. It may be categorically stated that when you find a foot which offers no obstacle in the course of early treatment to complete and relatively easy correction of the equinus you have at least two strikes on the inveterate club foot situation. While the reciprocal state of affairs, very fortunately, does not always predicate inveterate club foot, it, nevertheless, makes us realize the importance of equinus as an ally or an antagonist.

When should surgery be employed for its correction? When it is established that dorsal flexion of the talus and the calcaneus cannot be produced by stretching force, and this can be determined only by x-ray and not by clinical appearance. The tendo Achillis should be carefully lengthened by an open procedure, and the posterior ankle joint capsule divided along with the posterolateral and posteromedial ligaments after meticulous dissection and retraction of the neuromuscular bundle on the medial side

Delay in surgical correction is hazardous, but is essential under some circumstances and permissible under others. Delay is essential when incomplete correction of the varus exists, as a successful result from surgical correction of the equinus will be materially helped by thorough primary overcorrection of the varus, particularly

of the heel 'Final postoperative retention must be in a position of calcaneovalgus, otherwise, the heel varus will be reproduced, become the leading contender for consideration, and the additional splintage time necessary may well limit the range of plantar flexion at the ankle joint This frequently happens in these cases

It may be argued that limitation of plantar flexion is the lesser of two evils, possibly it is Certainly, in the same consideration of varus, I find a somewhat similar parallel in my own cycle of thinking the early, almost pride in converting a varus to a valgus foot, the later concern that attended such overzealousness, and now, I am almost back to where I started from—not proud, but apt to be content, particularly if it has been a difficult correction—However, one's conscience is not often placed upon the valgus-varus balance in the treatment of club feet

Delay in surgical correction of equinus is permissible in feet where questionable overcorrection of the equinus obtains, coupled with acceptable overcorrection of the other elements and in which they show no tendency to backslide The influence of weight-bearing function, coupled with intelligent home manipulation, may be all that is necessary

Delay in correction of the equinus by surgery should never be indulged in to the point where deformities of the talus will prevent it from being recessed in the ankle mortise

Just a word about the complication of calcaneus following division of the heel cord—it happens rarely, but it does occur and should be thought of in cases with thin, weak, poorly-developed leg muscles. Apparently some of these calf muscles, while supported by strong contracted capsule and ligaments, can in spite of weakness exert a dominant deforming influence, but lengthen it and rob it of its supporting contractures, and it will prove incompetent for normal function, particularly if acting against a joint which becomes progressively limited in plantar flexion. Capsulotomy without division of the heel cord is a safer procedure under such curcumstances.

Tendon Transplantation and Soft Tissue Releases

Anterior tibial tendon transplantation can be a valuable adjunct in properly selected cases. It does not have a wide application and cannot be expected to turn the tide of a marked general trend toward recurrence of the deformity. It should not be relied upon where equinus is a major consideration, nor for the purpose of preventing recurrent forefoot adduction. Its greatest value is for combating hindfoot inversion and it has some value by its elimination as a forefoot

invertor Its ideal application is in a nonresistant or well-corrected foot to passive manipulations, where either nonweight-bearing, or weight-bearing activities bring out the habitually deforming influence of an overactive anterior tibial muscle

It can be successfully anchored in cartilage and therefore, can be used early. The site of implantation is determined by the individual problem. The foot should be previously overcorrected and the transplant made with the foot held in this position. One cannot help being impressed at operation in very young patients by the large size of these anterior tibul tendons.

Soft-tissue release operations in the past have been reserved for the older, more deformed and more resistant type of club foot, in which adequate correction is otherwise impractical or in feet in which it is felt that additional insurance against recurrence may result from the addi tional overcorrection which can be obtained in this way In general, the results from soft tussue release operations have been disappointing. It is unimportant to go into detail as to the comparative methods that have been described, the im portant thing is to operate upon each foot as an individual problem releasing all restraint to correction with such thoroughness that force is not necessary to maintain the attitude of correction

For several years we have been developing a medial release operation that now seems to have proved its worth. It will soon be described as we have employed it in a representative number of cases, including an earlier age group. An incomplete release, even after following all the steps of any described operation, is a waste of time.

Osteotomies for Rotation of the Leg Bones

In club feet, accurate calibration of internal torsion of the leg bones is one of the most difficult items in clinical observation that I know of It is interesting to note the varying degrees of its seventy as recorded by different observers and often it has been my expenence to evaluate it quite differently on two successive examinations. It does exist as a definite feature in many club feet, it seems to have a tendency to improve with improvement of the deformity below. When present, it does not always impose a pigeon toe gait. When it is severe and when intocing is out of proportion to the deformity in the foot, it should be corrected by derotation estectomy. When corrected it appears to have but little influence on the base estimation.

Subtalar arthrodess used in its broad sense needs no comment other than to say it is the most satisfactory definitive procedure in the age group where it can be used, and its usofulness in rehabilitation is very gratifying

There will arise not infrequently in the planning of surgical treatment, sufficient change in the foot as a result of preoperative overcorrection, so that one is tempted to revise the operative program and do less than was considered necessary previous to the preoperative stretching. This may be wise in some instances, but, on the whole, the past behavior of the foot is far more important than its appearance as it emerges from a series of corrective casts.

In the Club Foot Clinic at the New York Orthopedic Dispensary and Hospital, 2 894 patents were treated during 1942 and 1943 During this two-year period, 30 cases were admitted to the wards and operated upon A total of 49 operative procedures of the types discussed were carried out. The results are tabulated in Tables 1 and 2.

Conclusions

In club feet, trends are usually established early in their behavior in response to treatment

	T	ABLE 1		
Type of Operation	Number of Operations	Average Age at Time of Operation	Average Time of Follow Up	Result
Lengthening of Tando Achillis and expenditions, 3 Alone, 9 With medial release 4 With anterior tibial transplant, 3	16	3 8 years	2 53 years	Excellent, 1 Good 6 Fair 6 Poor 3 (2 of these were atypical, or third type club feet)
Transplantation of anterior tibial tendon Alone, 4 With Tendo Achillis lengthening and capsulor With subtalar arthrodom 1	8 iomy 3	5 6 years	27 уски	Excellent, 2 Good, 2 Fair 3 Poor 1 Required a later medial
Medial soft-tissue release Alons, 2 With Tendo Achillis lengthening and capsulo	6 tomy	5 5 years	2 75 years	ralease Good, 2 Fair 8 Poor 1 Required a later subtalar
Tibial catactemy	3	2 7 years	1 5 years	arthrodesis Good, I Fair I Foor I (as to the foot) In all cases the leg tor sion was completely cor- rected

TABLE 2

Type of Operation	Number of Operations	Average Age at Time of Operation	Average Time of Follow-Up	Result
Subtalar arthrodesis Alone 2 With anterior tibial transplant, 1 Subsequent to previous surgery Type and time afterwards Tendo Achillus lengthening and capsulotomy 3 years 1 8 years 2 Tendo Achillus lengthening and tibial osteotomies 10 years 2 1 5 years 1 Subtalar arthrodesis (revisions) 10 years 1 5 years 2	13	11 4 усага	2 9 years	Excellent 1 Good 9 Fair 3

Transplant of the extensor longus digitorum Transplant extensor hallucis longus	2 1	14 years 12 years	3 25 years 3 6 years	Good Good

If the trend is toward the chronic, inveterate, or recurrent pattern, one is justified in considering carefully the "conservative" surgical possibilities

Surgery in club feet must be used as an adjunct to, and not as a replacement for, nonsurgical methods, except in the older age group

In the older age group that reach bone maturity with deformity and disability, bone resection and arthrodesis is a very satisfactory method of rehabilitation

Discussion

Dr Halford Hallock, New York City —Dr McCauley has emphasized, and rightly so, a conservative attitude in that surgical procedures are reserved for those feet that belong from the beginning, or early in their existence, to that difficult group which is characterized by chronicity, recurrence, and inveterateness. The well-established nonoperative methods that are effective in the majority of cases are not changed.

In order to reduce to a minimum the number of patients regressing into the difficult group, it is important that conservative treatment be carried to completion. Dr. McCauley's standards of correction and emphasis of the use of x-rays to determine the degree of reposition are of importance. It is absolutely necessary to obtain full, or better, overcorrection. One of the most difficult components of the deformity to correct is the medial or internal rotation of the os calcus beneath the talus. Often it is not corrected and x-rays are the only means of surely detecting it. This point also has been emphasized by Kite.

The operative methods at the New York Orthopedic Hospital that have proved to be of most value are the ones mentioned by Dr McCauley The results of the subtalar arthrodesis group are the best, 77 per cent This operation, however, cannot be

performed until sufficient tarsal development has oc curred, particularly in the navicular bone, to allow adequate bone surgery without endangering the future growth of these bones Otherwise, a small misshapen foot may develop

The results of the calcaneal tendon lengthenings and capsulotomies in the group reported are fair, 41 per cent of 8 cases excellent or good. The average age at the time of operation was 3½ years. All though the group is small and conclusions therefore cannot be drawn, it is possible that better results would be obtained if the operations were performed earlier before there had developed any considerable bone deformity in the ankle joint as a result of a longstanding equinus.

The anterior-tibial transplants have given quite good results—50 per cent—in a small group. Dr McCauley has emphasized the need for selection in its use and the necessity for the attainment of overcorrection before its employment. So far as we know, there has developed no fixed plantar flexion or drop of the first metatarsal as a result of having removed the pull of the muscle from the dorsal surface of this bone.

The results of the medial releases were fair, 2 good and 3 fair in 6 cases. The average age was 5½ years and, as in the group with calcaneal tendon lengthenings and capsulotomies, better results might be obtained if the surgery was performed earlier. For the expectation of best results, the release should be done, following the failure of nonoperative means, before too much bone deformity has occurred

PUBLIC HEALTH ASPECTS OF RHEUMATIC FEVER

ALBERT D KAISER, M D, Rochester, New York

R HEUMATIC fever is today one of the foremost health problems of childhood Between the ages of 5 and 9, deaths from 1t are outnumbered only by those from the four principal
communicable diseases of childhood as a group
Even mortality from pneumonia has fallen below
that for rheumatic fever At the ages of 10 to
14, it is the leading cause of death Between the
ages of 15 and 25, it is second only to tuberculosis
Although it is true that the mortality from rheu
matic fever has declined, the rate of fall is less
than that from other diseases, so that the proportion of deaths from rheumatic fever to the
total number of deaths annong persons under the
ages of 25 has increased

Clinical Manifestations

One of the difficulties encountered in discussing the public health aspects of rheumatic fever is the scope of clinical manifestations assigned to this term. Rheumatic fever when it presents a fairly definite clinical entity is well understood. When, however, the nonspecific qualities are considered, which are known to play a part in the production of heart disease the nomenclature is not uniform and frequently not clear. Recogning the need of uniform definitions in desorbing this disease, it is quite definite that rheumatic fever with its protean manifestations is mesome obscure way associated with hemolytic streptococcal infections.

Symptomatologically, active rheumatic fever is recognized by a number of different manifestations, many of which seem to represent differing age expressions of the reaction of the host. We may find fever acute and subacute arthritisty sydenham's Chorea, and carditis with pencarditis, active myocarditis or endocarditis, also pleurisy and peritomitis, abdominal pain, epistaxis, torticollis, subcutaneous nodules and skin cruptions, all of which are listed among the manifestations of rheumatic fever. When recognition is given to the acute, chronic and latent phases of this disease, the magnitude of the rheumatic problem can be considered.

Antedating the birth of the name rheumatic fever is the longstanding emphasis upon the fact that exposure to cold and dampness was supposed to be one, if not the main, cause of arthritis. That heart disease was part of the picture of rheumatic fever is a comparatively recent de-

velopment in the story of rheumatic fever for it did not come to light until the late eighteenth and early nineteenth centuries. According to Hedley. Havgarth in 1805 was the first to write a clinical monograph on this disease, and the first to call it rheumatic fever By 1850 rheumatic fever became well established as an entity infectious nature soon became suspected and toward the end of the century the juvenile forms began to be recognized clinically in England When heart disease became an integral part of the rheumatic fever picture, it proved to be a means of identifying rheumatic fever, of separating it from other diseases, and of giving it enough individuality to warrant its separate analysis. Finally came the realization that the joint lesions and the heart lessons were but part of a widespread infection, and this concept soon placed rheumatic fever in the category of an infectious syndrome

General Statistics

In attempting to obtain some figures on the incidence, prevalence and general importance of rheumatic fever, it is necessary to turn to methods which although they are not very accurate, are the best methods available. Information is obtained from mortality statistics including postmortem examinations from compulsory notification, special rheumatic clinics, hospital admission rates, and from special groups such as school children, college students, Army and Navy recruits, and industrial workers

From these methods it is noted that in the Scandinavian countries, where rehumatic fever is a reportable disease, the incidence per annum has ranged from about 1 to 3 per 1,000 In London, where only the child population has been considered, the incidence was 1.8 per 1,000

In this country juvenile deaths (age group 5 to 24) from cardiac disease have amounted to 17 per 100 000 population. From hospital ad mission figures, active cases of rheumatic fever make up from 0 1 to 5 per cent of the admissions to the medical services of general hospitals in this country and probably twice this figure when applied to children's hospitals. Rheumatic heart disease has been detected among school children at a rate of from 0.3 to 4 per cent and among college students from 0 6 to 10 per cent. According to Paul 2 the general estimate of case prevalence for rheumatic heart disease in the whole United States would indicate that between 350 and 700 cases exist for every 100,000 people.

Presented at the 140th Annual Meeting of the Medical Society of the State of New York Section on Public Health Hygiene and Sanitation, May 1 1946

The general impression exists that rheumatic fever is common and severe in temperate zones and that it is less common in warmer, subtropical, and tropical zones It has also been suggested that the clinical picture of rheumatic fever may he milder in subtropical as compared to tem-On the basis of hospital adperate climates mission rates and from mortality statistics collected from areas with an adequate range of varying climates, it seems quite certain that there is a lower prevalence of rheumatic fever in the southern latitudes, as compared with northern ones Considering the mortality rates for rheumatic heart disease in different areas, it is clear that the southern rates are considerably lower than the northern Paul,3 in a survey of Indian school children, discovered that the prevalence of rheumatic carditis among children living close to the Canadian border was found to be almost ten times that encountered among children living close to the Mexican border

There can be little doubt about the differing prevalence of rheumatic fever under the various climatic conditions, but there is much doubt as to its explanation. It appears certain that rheumatic fever, like many upper respiratory infections, seems to flourish best under conditions where there is cold weather and damp weather. This may lead to crowding within doors and perhaps tend to spread the infection.

First attacks of rheumatic fever occur largely during school age, or the six or seven years preceding puberty. Though susceptibility to both first and recurrent attacks decline rapidly in the years after puberty, rheumatic fever cannot be regarded clinically as a disease of childhood, for active rheumatic carditis and polyarthritis are common during adolescence and young adult life Epidemiologically, however, it is reasonable to regard rheumatic fever as a disease of childhood or school age, because from the age distribution of first attacks, the period of midchildhood is the period of greatest vulnerability

Such factors as sex susceptibility and physical characteristics have been studied but no unusual relationship is known to exist in this regard. As to racial susceptibility, there are conflicting reports. Available studies suggest that Irish people living in the vicinity of New York City seem to acquire rheumatic fever somewhat more readily than the average. In Rochester individuals of Italian extraction appeared to lead in the incidence of this disease.

Influence of Environment and Diet

The influence of living conditions on rheumatic fever has been investigated thoroughly This includes housing, dampness within the home or

working place, crowding, food, and all the usual circumstances of poverty or affluence. It is a matter of common knowledge that there are living conditions under which "epidemics" of rheumatic fever are prone to occur, such as hospital wards, schools, barracks for naval or military recruits, and nurses' training schools. It is generally conceded that rheumatic fever is more a disease of the city than of the country Atwater and Hedley have both presented data based upon mortality statistics to show that the incidence of rheumatic fever is higher in urban populations than in rural ones. It seems to be generally accepted that rheumatic fever is more common among the poor, but the degree to which this is true is considerably less in this country than was thought to be the case in England a dozen or more years ago

Attention has been focused on the fact that rheumatic fever is a disease which thrives best in cold, wet climates. Considering the fact that this disease is rare in the arctic regions, it would seem that cold and dampness within doors is more important as a contributing factor.

There has been much speculation as to the part that malnutation or some dietary deficiency plays in predisposing to rheumatic fever. A deficiency of vitamin C leading to a subclinical scurvy has been pointed out as a probable factor in the pathogenesis of rheumatic fever Sendroy and Schultz. 6 however, in a study of the ascorbic acid excretion of active and quiescent rheumatic fever patients and control patients were unable to agree that an ascorbic acid deficiency influenced the onset of rheumatic fever Thus far no conclusive studies have been reported which can attribute any specific food deficiency as a causstive factor in rheumatic fever However, rheumatic fever is more commonly found in malnourished individuals than in well-nourished subjects

The factor of crowding and rheumatic heart disease has been carefully analyzed in England. Based upon these studies, Perry and Roberts believed that they could single out crowding as a factor of unique importance in determining the prevalence of this disease

Many years ago it was pointed out by Cheadle' of London that there is a hereditary factor in rheumatic fever. Since that time it has been repeatedly demonstrated that there is a prevalence of rheumatic fever within certain families. The studies of Wilson and Schweitzer' of rheumatic families present evidence to suggest that an underlying hereditarial predisposition to rheumatic fever exists. When other environmental factors are considered along with the so-called "positive-parent" families, it appears that in a family of children of which one or both

of the parents are rheumatic, the chances are better for a higher prevalence of rheumatic fever among these siblings than would exist among a similar group of ablings whose parents were not rheumatic. It is of considerable epidemiologic importance to know whether this high familial provalence of rheumatic fever is entirely due to hereditary influences, environmental influences, or to a mixture of both. Thus far, this matter has not been solved.

Relationship with Hemolytic Streptococcus

For many years rheumatic fever has been assoclated in some way with a hemolytic streptococcus infection, but in recent years a close relationship is assumed to exist between this disease and a particular kind of streptococcus-namely, to Group A hemolytic streptococcus. Coburns' studies have strengthened this relationship 10 He developed the point of view that the pathogenesis of rheumatic fever might in its essence be explained as one of the late effects, or "sideeffects" of an acute hemolytic streptococcie infection. Clinical studies as well as laboratory tests to determine the elaboration of nonspecific antibodies, group antibodies, and type-specific antibodies, support the theory that rheumatic fever is an expression of faulty immunity to the streptococcus on the part of the rheumatic host As a result of an inadequate immune reaction, the rheumatic activity signifies the continuance of subclinical activity of the hemolytic streptosoccus. The relationship of rheumatic fever to Group A hemolytic streptococcus is still confusing It is not clear why some of the complications of streptococcic infection are of the common suppurative type which seem quite apart from rheumatic fever while others are of the nonsuppurative type characterized by fever, arthritis, pleursy, and carditis. theorize the prerheumatic or rheumatic child is a child who, for either hereditary or acquired reasons, is less capable of "handling" an acute streptococcic injection than is the nonrheumatic. The apparent relationship of this disease to streptococcie infection is supported by the observations of several investigators that recurrences of rheumatic fever can be prevented in rheumatic children by the prolonged administration of small doses of sulfanilamide.

From the epidemiologic standpoint, there are several reports of "epidemics" of rheumatic fever preceded by epidemics of "tonsillitis" or of acute hemolytic streptococcic infection. Seegal¹¹ has pointed out that scarlet fever becomes less frequent as one travels from the northern to the southern part of North America, and that all forms of hemolytic streptococci are less com-

monly found in human throat flora in the subtropical or tropical islands of the West Indies than in the northern half of the United States

From a seasonal point of view, comparative clinical data on rheumatic fever and streptococcio infections run a close parallel. Farquhar and Paul¹³ demonstrated this fact by comparing the monthly hospital admissions for rheumatic fever with those of acute tonsillitia, scarlet fever, and eryspelas in New Haven

Experiences in the recent war, especially in certain naval training stations, agree with previous observations that "rheumatic epidemics" were closely associated with upper respiratory and hemolytic streptococcio infections.

Recognising the various relationships that appear to exist between streptococcic infections and rheumatic fever makes it appear obvious for clinical, immunologic, and epidemiologic reasons that hemolytic streptococcic infections have something to do with rheumatic fever

Necessity for a Rheumatic Fever Program

Although tuberculous and syphilis have assumed important public health aspects, rheumatic fever, the third most common chronic infection, has not received much attention. The reasons for this are obvious. The cause of rheumatic fever is obscure and we have no positive available tests for its diagnosis such as the tuber culin test or the Wassermann test. Then, too, the treatment of rheumatic fever has been rather unsatisfactory. In spite of these discouraging features to the public health officer, Swift¹¹ has emphatically stated that because the treatment of this disease is time-consuming and expensive, it is no argument for not attempting to effect a cure.

Case finding, well recognized in tuberculosis and syphilis, should be one of the first objectives in a public health program. The classic forms of rheumatic fever are usually promptly diagnosed and treated, but the subscute forms and the juvenile forms, particularly the forms without polyarthritis, are not as readily recognized. The relatively new concept of juvenile rheumatic fever and the so-called "subclinical rheumatic fever" poses a problem in diagnosis which becomes a part of the public health program. It is now generally accepted that the milder and less easily recognized cases which lack polyarthritis may develop severe cardiac symptoms. Prophylactic measures, therefore, are indicated as much for the subclinical case as for the clini cally obvious one. It becomes a function of the public health program to spread information leading to a clearer definition of the disease.

When one considers the natural course of this disease beginning with the initial infection,

usually an upper respiratory streptococcic infection, a quiescent stage, which may be considered an incubation period and then the stage of rheumatic activity followed by rheumatic heart disease, it becomes obvious that education in this disease is desirable. The hazard of reinfection with an exacerbation of the rheumatic process occurring months and years after the initial attack further emphasizes the importance of education in the management of this disease

Education for the Lasty

The program of education designed particularly for the lasty must explain the steps involved that are of therapeutic value, namely, the care of the acute stage, the care of the subacute stage, which is often prolonged, and the follow-up care Facilities usually obtainable in a general hospital should be made available in the acute stage As the case passes into the subacute or chronic stage, where long-term care is essential, a different type of facility is required A convalescent hospital with services that take into consideration the psychologic problems that arise in the case of a chronic illness is preferable The after-care involves supervision in the home, or in foster homes, and by public welfare agencies, school authorities, and departments of health coordination of the efforts of all these agencies is the real function of a properly conceived public health program This should include not only the care of rheumatic children but of adults with rheumatic heart disease

A central register successfully utilized in the long range supervision of tuberculous patients offers a pattern for a register to be used for all individuals designated as having some type of rheumatic fever It might well become the function of the health department to maintain such a register to see that the individuals listed are at all times receiving the proper care finding would be aided and with new developments in the field of prophylaxis prompt assistance could be offered members of the rheumatic The experience of the London County families Council's Rheumatism Scheme in the establishment of a juvenile rheumatic register has proved of great value and could well be introduced in our American cities 14

There is increasing activity on the part of public health groups in combating this disease. The American Heart Association, with its standards for cardiac clinics, has provided machinery for carrying out part of the program. The American Academy of Pediatrics is directing the management of juvenile rheumatic fever in the schools and the Children's Bureau of the Federal Security Agency has set aside federal funds

for the purpose of developing state programs for children with heart disease and conditions leading to heart disease. Local health agencies both voluntary and official are beginning to attack the rheumatic fever problem along the same lines that proved so effective in the organized efforts to combat tuberculosis. Until the etiologic factor is definitely disclosed and until a specific method of treatment and prevention is known the public health approach should be strengthened and coordinated with the management of rheumatic fever that is now conducted largely by the individual physician or by the hospital

44 MARSHALL STREET

Discussion

Dr J G Fred Hiss, Syracuse—I should like to stress the point that heart involvement or carditis is a part of rheumatic fever, not a complication. There is considerable evidence to indicate that histologically the heart is involved in 100 per cent of the cases of rheumatic fever. However, if one considers the clinical signs only, the heart is involved in two thirds to three fourths of the cases. Those who have no clinical cardiac involvement probably have no great reduction of their life expectancy and need accept no restrictions of activities.

It is my impression that rheumatic fever is just as common in the rural as in the city areas I beheve that the statement that occurs quite widely in the literature to the effect that this is primarily an urban disease is incorrect. Or, possibly, we no longer have truly rural areas in our State the coming of the automobile and the hard-surfaced roads, and especially the central schools, all parts of our State are probably more accurately described as being either urban or suburban, and not rural. In a general survey of the school children, I am of the opinion that this disease occurs just as frequently among the better class families as it does among the poor families It is also my impression that food has little or nothing to do with rheumatic fever It scems to me that the military experience has fairly well destroyed the food theory as to its being a factor in the causation of rheumatic fever The multary personnel in this country received a very high calone and high vitamin diet and still the age group found in the Army had a great deal more rheumatic fever than the corresponding class in civilian life that did not have this type of food In other words, I am rather firmly convinced that in rheumatic fever we are dealing with two factors, the one in the host himself, which can be called the inherited susceptibility so well described by Dr May Wilson, and the external factor, the "infectious" factor, probably streptococcic in nature I subscribe to the theory that when the proper host and the proper infection are brought together that rheumatic fever may occur, and that probably the crowding in the military camps which brought together numerable susceptible people, as well as many strains of bacterra, was conducive to the widespread rheumatic

fever enidemics. In other words, one must have the

proper soil" and the proper seeds."

I agree very thoroughly with Dr. Kaiser that this problem presents a tremendous public health program. In this connection it has been my lot to give many talks recently to both lay and professional andiences, and I have found it very useful to compare the rheumatic fever problem with the tuber culous problem. I have stressed that in each case we have a chronic disease with a tendency to have periods of inactivity. In neither case do we have any specific medication and rest is at present the best treatment.

If one recalls the plan of attack on tuberculous, the similarity to the suggested plans of attacking rheumatic fever there is a striking similarity will be recalled that the first part of attacking the tuberculous problem consisted of extensive lay education and professional education. people had to be told about the early symptoms of the disease so that they might report to their doctor early The physician on the other hand had to be instructed about the earliest symptoms rather than to depend upon those that had been taught in physical diagnosis which usually represented advanced tuberculosis. In this way many milder or earlier cases were detected. The next step in the program was the placing of diagnostic aids at the disposal of the physician. These consisted of certain laboratory aids, such as sputum examinations, x ray plates and consultation service. The next step was to establish special hospitals for tuberculosis as these cases could not be taken care of very well in general hospitals. After this, follow-up clinics with voca tional guidance were established. It was important to follow each case of tuberculosis after its apparent recovery in order to detect the earliest signs of relapse and to give vocational guidance so that the patient would be less ant to break down because of external conditions. In spite of all these measures it was found that an active program of case finding was necessary In the case of tuberculosis, this consusts of mass x ray examination and at the present time is the only possible way of picking up the latent or subclinical active or mactive case of tuberenlosis

If one looks at rheumatic fever it will be seen that the first need is an extensive lay and professional education program so that parents especially may take their children to see the physician when only mild symptoms are present. Also the doctor must be instructed in the interpretation of the very mild and early signs and symptoms. He has no difficulty in recognizing the well-advanced cases. In order to do this, in some instances, diagnostic aids are necessary such as consultation and laboratory service. As in tuberculosis the next step consists in establishing certain special hospitals. rhoumatic fever patients are not easily treated in general hospitals because of the chronicity of the disease and the general shortage of hospital beds. Special hospitals for rheumatic fever must also have very definite educational facilities because most of the victims are children of school age. A hospital of this type must really be a school. Next, a follow up clinic for giving educational and vocational guidance is necessary Even placement in industry service should be available. After this we need a "case finding' procedure. In the case of rheumatic fever the machinery for this is already in existence namely the School Health Service. As most of the cases start in childhood, adequate school examina tions which in New York State are supposed to be done every year should detect carly and minimal signs of rheumatic fever In most parts of the State the School Health Service will have to be improved to meet this need but it certainly is much better to do this than to develop any new case finding method

In both programs, tuberculosis and rheumatic fever a certain amount of research should be carried on with an attempt to find better treatment and also complete preventive methods and procedures.

The comparison of tuberculosis and rheumatic fever programs as described shows them to be almost identical, and the entire program when described in this way can be grasped easily by the average lay person. Without this comparison, I have found that there is a great tendency to consider the special hospital as an entire rheumatic fever program. Of course nothing could be further from the truth.

THE AMERICAN COLLEGE OF PHYSICIANS

The twenty-eighth Annual Session of the American College of Surgeons will be held in Chicago April 28-May 2, 1947

Dr David P Barr New York, is president of the College and will be in charge of the program of general esessions and lectures. Dr LeRoy H. Sloan Chicago has been appointed general chalman, and

will be in charge of the program of hospital clinics and panels as well as local arrangements, entertain-

ment, etc.
Mr Edward R. Loveland executive secretary of the College 4200 Pine Street, Philadelphia 4, will have charge of the general management of the session and the technical exhibits.

PLAN FOR STATE-WIDE DISTRIBUTION OF BLOOD AND BLOOD DERIVATIVES—ORGANIZATION

I J Brightman, M D, Albany, New York

(Field Director, Blood and Blood Derivatives Program, New York State Department of Health)

CCIENTIFIC advances during the past decade have been demonstrating an increasing number of clinical indications for whole blood and plasma transfusions and for the use of blood derivatives, such as albumin, gamma globulin, fibrin foam, fibrin film, suspended erythrocytes, and erythrocyte paste Limited availability and considerable costs have prevented these valuable biologicals from being used to optimal advantage. In 1943 the Subcommittee on Blood and Plasma Exchange Banks of the Medical Society of the State of New York¹ reported that blood and plasma banks and transfusion facilities are lacking in a large percentage of the hospitals of New York State, and that plasma is not as widely available and is not being used as frequently as the newer knowledge of its therapeutic importance seems to indicate In a survey of the New York State hospitals in 1944,2 38 per cent of 156 hospitals reported that their blood and plasma requirements were not being adequately met Although 57 per cent claimed to have sufficient supplies readily available, only 17 per cent of the total reported the use of 80 per cent or more of what might be considered the optimal use of blood plasma This latter is estimated at four transfusions per general hospital bed per year, based on the reported experience of hospitals where unlimited supplies have been available for several years The total amount of blood and plasma used by all reporting hospitals was about 60 per cent of the optimum

During the war, the community blood collecting clinics established by the American Red Cross made the public aware of the needs of blood and plasma, and of the ease with which the ordinary person can donate a pint of blood. The willingness of the public to donate blood for the benefit of civilians in their own communities, as they did for the armed services, will vastly reduce the cost of blood products by eliminating the paid donor, and also greatly increase the supply of blood. The past few years have seen at least eight states undertake programs for the free distribution of plasma voluntarily contributed by local communities.

New York State Program

In 1945 the New York State Legislature passed

Presented at the 140th Annual Meeting of the Medical Society of the State of New York, Section on Pathology and Clinical Pathology, May 2, 1946 an act authorizing the State Commissioner of Health to conduct a program whereby blood and blood derivatives could be made available to persons in all parts of the State The following objectives have been defined to carry out the intent of this act

1 To make whole blood and blood derivatives readily available to all parts of the State without cost to the recipient

2 To establish standards for blood banking, to recommend procedures which will promote uniform and safe technics, and to approve qualified banks to protect the public from the dangers of improper practices

3 To conduct a lay educational program emphasizing the needs for human blood so that blood and plasma administered to a patient may be replaced adequately by friends or relatives or by community organizations

4 To conduct a professional educational program emphasizing the clinical and laboratory indications for the use of whole blood and plasma, possible abuses of such, and clinical and laboratory guides during transfusion therapy

There are numerous excellent blood banks, especially in the larger cities, which are already well serving the needs of their individual com-The greatest need lies in the more rural areas of the State In order to assist existing banks to expand their facilities so that larger areas may be served by them, the State Department of Health will provide technical assistance, A, B, and Rh typing sera, and the necessary reagents Where blood banks are operated or are contemplated by city or county laboratories already receiving State financial aid, the State will reimburse the cities or counties for 50 per cent of the costs of equipment and operation of the banks

Replacement of Blood

Obviously, the successful operation of a blood bank depends upon an adequate amount of blood being deposited to cover the amount being withdrawn. Unless other provisions are made (vide infra), it must be the fundamental responsibility of the patient-recipient to arrange for the replacement of blood drawn from the bank. A two to one ratio on repayment for blood is necessary in order to provide a sufficient surplus so that any demands of unusual size or for the rarer blood groups may be met. It is also necessary to pro-

vide against such contingencies as unusable blood because of hemolysis or positive serologic test for syphilis, loss by breakage, or less than a full unit being obtained from any donor Bloods not used before their expiration date will be processed by the State Laboratory into typing sera or dried nlasma.

The average patient should have no difficulty in providing two donors to replace blood for a single transfusion of 500 ml Definite hardships would be placed upon patients requiring multiple transfusions if replacement is required for each unit of blood received It will therefore be the policy of the program that no more than two donors replacing one pint of blood each be required of any patient regardless of how many transfusions he may require, although extra donations

may be volunteered.

The responsibility of depositing blood in the bank may be lifted from the patient and assumed by a community group Such a group may recruit donors from such organizations as service clubs, industrial plants, trade unions, civic or church associations, etc., in all areas served by the bank, and arrange for periodic bleeding clinics at which large amounts of blood may be collected and sent to the bank. This community activity could supply the entire needs of the bank at all times, or be limited to replacing blood only for patients unable to supply donors, or to building up the bank reserves when heavily drawn upon at times of disaster The National Headquarters of the American Red Cross has approved the participation of its local chapters in such programs, provided that certain criteria are met, such as that no donors be paid for blood and that no charge for blood be made to any patient.

The requirements for dried plasma are being currently met through the release by the Ameri can Red Cross of a large stock which was declared surplus by the Army and Navy The supply is estimated to be sufficient for the needs of the State for two to three years For future needs

dried plasms will be processed by the State laboratory from blood collected in excess of the needs of the cooperating banks.

The dried plasma is being made available to small hospitals and physicians through the local laboratory supply station, and to larger medical centers directly from the State laboratory Replacements for dried plasma are made at the nearest blood bank, on the same basis as for whole blood While stipulating that the surplus dried plasma now being distributed must be free to the patient, the American Red Cross has permitted that the patients be asked to arrange for replacements in the usual way

Summary

By assisting local communities to develop and expand their blood bank facilities, and by providing dried plasma through the State laboratory. New York State should be able to remove the hitherto prevalent restrictions of limited avail ability and excessive costs, and so make blood and blood products freely available to all persons who can be benefited by them. An already well informed public can be further acquainted with current needs through the collaborative educational efforts of the State Department of Health and voluntary agencies Recent advances in therapy with blood and blood transfusions can be brought to the attention of all practicing physicians through a joint program of the State Medical Society and the State Department of Health. Physicians returning from active military service have already expressed the viewpoint that they hope to have blood and blood products as freely available for their civilian practice as these were during their military expenence.

A.M.A. TO HOLD CENTENNIAL

The American Medical Association is going to celebrate its centennial in Atlantic City, June 9-13
1947 Elaborate plans are being made for this celebration.

Only Fellows and invited guests are eligible to attend. Membership in the State Society is the primary qualification for Fellowship in the A.M.A. Fellowship dues and subscription to the Journal of the American Medical Association are both invited in the Medical Association and the Medical Association and the Medical Association are both invited in the Medical Association and the Medical Association are both invited in the Medical Association are both invited in the A.M.A. Fellowship in t cluded in one annual payment of \$8.00 which is the

cost of the Journal to subscribers who are not Fellows.

If you are not a Fellow and plan to attend the Atlantic City session, which will be a milestone in medical history you can save yourself considerable time and confusion when registering, if you will write now to

The American Medical Association, 535 North Dearborn Street, Chicago 10 and ask if you are eligible to become a Fellow

PLAN FOR STATE-WIDE DISTRIBUTION OF BLOOD AND BLOOD DERIVATIVES—TECHNICAL ASPECTS

DAVID R CLIMENKO, M D, Ph D, Albany, New York

(From the Division of Laboratories and Research, New York State Department of Health, Albany)

BLOOD as an agent for the treatment of the sick and the injured is a comparatively recent addition to the therapeutic armamentarium of the physician Its possible use has intrigued physicians from the earliest times, and the ancient medical papyri contain numerous descriptions of procedures for carrying out such operations But these are largely fanciful excursions of the imagination based on wishful thinking, including, as they do, accounts of successful transfusion from animal to man Isolated reports of therapeutic transfusions crop out in the history of the middle ages, but the subject really came to the fore in the early days of the Royal Society when attempts at transfusion were carried out in Paris and London It was during this period (1667) that Denis¹ gave his classic description of the hemolytic transfusion reaction, which has scarcely been improved upon, up to the present therapeutic results of transfusion during that period were uniformly so disastrous as to warrant the legal prohibition of the procedure

The practical use of blood as a therapeutic agent is a development of the twentieth century and is dependent upon Landsteiner's description of the isohemagglutinin for its rational basis. You will appreciate more readily the newness of the procedure when you realize that the accepted transfusion method in the first decade of the century was based on direct vessel to vessel transfer of blood from donor to recipient, either by use of cannulae, fitting tubes, or anastamotic sutures. The surgical technics were difficult and the use of the procedure was severely restricted.

Throughout the intervening years, a large civilian experience and the background of the treatment of the casualties of two major wars have simplified the technic of transfusion and broadened the scope of its usefulness. Today, the administration of blood or blood derivatives has ceased to be the final desperate gesture of the helpless physician toward a moribund patient and has become a recognized therapeutic device used in the presence of established clinical indications. The stability of plasma preparations, the separation of blood into its various fractions, and the introduction of the blood bank have multiplied the number of these indications and

increased the availability of the material Actual figures are not available, but it is obvious that the clinical use of transfusion has grown tremendously in the last ten years, and that this high rate is continuing

With the increase in the therapeutic usefulness of blood and blood derivatives, new problems have arisen Most of them come within the scope of the clinical pathologic laboratory and public health authorities Every aspect of a blood transfusion service involves the laboratory, and its success is dependent on adequate and efficient laboratory control The initial selection of donors, the processing of blood into its vanous fractions, the preservation of these fractions, the choice of the preparation to be used in the treatment of a specific case, the selection of an appropriate blood for transfusion into a specific patient, and the evaluation of the therapeutic effectiveness of a transfusion procedure are all matters amenable to laboratory methods. They lead logically to the ancillary problems that are outgrowths of a transfusion service and include the elucidation of such clinical entities as the hemolytic anemias, erythroblastosis fetalis, and the obstructive nephroses It is from this group of investigations that we may expect new developments and new technics

The adjuvants required by a transfusion service and by the newer methods of fractionation of plasma into its various constituents present a new opportunity for service to public health The technical difficulties associated authorities with the provision of the former and the cost of the installation of fractionation equipment preclude the establishment of a complete unit by individual hospitals If plasma and its deriva tives and standard laboratory reagents are to become available for general clinical use, some central organization must provide aid for the operation of the laboratories that will process It would, of course, be possible for the commercial plants of the large pharmaceutic houses to do this However, the resultant cost of blood or blood derivatives would be prohibitive since the only source of blood now avail able to them is the paid professional donor

It is right and proper that so important a public health problem should be divorced from the profit motive and that no person should be denied the advantages of these therapeutic agents

Presented at the 140th Annual Meeting of the Medical Society of the State of New York, Section on Pathology and Clinical Pathology, May 2, 1946

solely by virtue of their cost. At the same time. it is imperative that the administration of these arenta should be as devoid of danger as is humanly possible To this end, a pilot plant at the Divi sion of Laboratories and Research is planned for the processing of blood, the preparation of serologic reagents, and other standard aids central laboratory will also be concerned with the ancillary problems already mentioned

Selection of Donors

It is impossible to overemphasize the need for care in the selection of the donor From the patient's point of view, it is imperative that the blood transfused into him should not carry agents of disease with it. Blood is a potential vector of disease At the present time, syphilis malaria, and homologous serum jaundice con stitute the principal dangers Adequate serologic tests must be carried out on every donor to ex clude the possibility of syphilis It must be realized, however, that a negative finding is not of itself conclusive, and that Treponema may be present in the blood of a person with a newly acquired luctic infection before serologic evidence becomes apparent. The presence of a primary change should be ruled out.

The return of many thousands of men from areas heavily infested with malaria presents new public health problems including one for the transfusionist The magnitude of this problem becomes more apparent when it is realized that these men constitute a significant proportion of the potential blood donors and may thus be the transmitters of malaria even though they never presented clinical symptoms of it. It was the common practice in the armed forces to ad minister suppressive doses of antimalarials to all personnel in areas where malaria was endemic The usual drug was atabrine which acts solely to prevent the multiplication of plasmodia within the body and so suppresses the appearance of the clinical disease. In choosing donors, all individuals who have lived in areas where the administration of atabrine was necessary should automatically be discarded Under no circum stances, should their blood be used for whole blood transfusion.

Another problem which our war experience has brought to the fore is that of homologous serum saundice. Its gravity can be best appreclated when it is realized that in the Army homologous serum jaundice was second only to venereal disease for hospital bed-days involved The otiologic agent has not been identified is probably a pantropic filterable virus which is transmitted from man to man by the parenteral administration of serum from an infected individual. One of the principal difficulties

associated with establishing the epidemiology of this disease is the long meubation period which may allow six months to elapse between exposure and the onset of symptoms. At the present time, no satisfactory laboratory procedure is available for the demonstration of this virus Serologic tests have not been developed and it has not been possible to produce the disease regularly in experimental animals safeguard available is the elimination of all potential donors who present a clinical history of jaundice during six months prior to the donation of blood. This period is empirical, but it will probably eliminate the greater number of carriers The virus is hardy It remains viable in all blood derivatives, including lyophilized plasma. Its virulence is not seriously affected by storage or by freezing and the disease has been transmitted by whole blood, by fresh liquid plasma, by stored frozen plasma, and by lyophilized plasma. Recently, Cohn and his coworkers' have shown that it is possible to eliminate the icterogenic agent from serum albumin So far, this is the only blood derivative, used on a large scale, that is free of the potential danger of producing infectious hepatitis.

Health hazards to the donor are small. Withdrawal of blood from an already anemic indi vidual, of course, should be avoided sional donors should not be permitted to provide blood too frequently The simplest method would be to eliminate him entirely, but occagionally practical considerations make this impossible. The blood regeneration of a normal individual on an adequate diet is excellent, but to obviate all possibilities of producing anemia, rest periods of at least three months should be insisted upon between successive donations. This point should always be borne in mind by hospitals that use their intern staffs as pro-

fessional donors.

Blood Grouping

The safe transfusion of blood from one indi vidual to another is premised on a knowledge of the isohemacclutining and on adequate meth ods for their determination Landsteiner's onginal division of the human race into persons whose cells contained either A or B antigen, both A and B antigens, or neither, formed the basis for all subsequent developments in this field In 1911 von Dungern and Hireshfelds made the first agnificant extension of this work when they described the two subgroups A1 and A5, with their possible combinations. They play an important role in transfusion because they are capable of inducing strong reactions. Later the subgroups were enlarged to include the more weakly reacting forms. A. A., and A.,

Landsteiner and Levine, in 1928, described the M and N system of human blood groups, which exist side by side, but have no connection with the ABO groups. They have little application to the problems of medicine, however, since anti-M and anti-N agglutinins occur so rarely in human sera that they may be disregarded

During the decade, 1930 to 1939, transfusion reactions were reported following the use of homologous ABO blood. Some occurred in individuals who had previously received blood from the same donor without ill effect. As early as 1917, Minot and Lee⁷ called attention to the fact that multiple transfusions involve much greater hazards than single, isolated transfusions, and cited 3 cases of severe hemolytic reactions in individuals who had previously accepted such apparently homologous blood without deleterious effect. They believed this to be the result of "the development by previous transfusion of some

unknown and unrecognized antibody to the donor's cells" It was 1940 before Landsteiner and Wiener⁸ identified and described this unknown and unrecognized antibody as the Rh factor

The development of our knowledge of the Rh factor has been of the utmost importance in the elucidation of the nature of these mysterious homologous-group transfusion reactions. This aspect of the problem, however, has been so overshadowed by the demonstration of the role played by the Rh factor in the etiology of erythroblastosis fetalis that its importance as a cause of rare transfusion reactions tends to be forgotten. It should always be remembered that severe, sometimes fatal, transfusion reactions do occur as a result of Rh incompatibility

Adequate blood grouping depends on the availability of reliable serologic reagents and competent laboratory personnel The preparation of reagents entails considerable technical difficulty and requires a large number of potential donors as sources of the more esoteric blood groups Commercial materials of animal origin have been made available but none is as satisfactory as the high titered, highly avid, human typing sera Fractionation methods have made it possible to separate the specific reagents from such sera and concentrate them further Such preparation is, however, beyond the scope of the average hospital laboratory The hospital looks to some central source of supply just as it does for its vaccines and antitoxins The reagents are the tools The workman cannot accomplish his task without them, but they are useless unless skilled helpers are available The proper training of technicians is of great importance, and the evaluation of reliable test procedures can only come from exhaustive investigation. The serious,

sometimes fatal, result of an erroneous blood typing cannot be overemphasized

Any laboratory worker who undertakes the typing of blood for transfusion purposes should constantly remember that he is primarily concerned with the type of the blood in a particular bottle rather than the blood type of the donor No value should be placed on any previous typing of the individual donor regardless of how reliable the source. It is with no sense of disparagement that I say that blood types on identification cards or Army dog tags should be disregarded. Some will be incorrect and errors of this nature must not be perpetuated. No blood should be used that has not been directly identified as to type

It is contemplated that blood transfusions will be carried out in institutions that are not equipped to perform blood typings or cross matchings. Such transfusions will of necessity constitute medical emergencies. It is planned to provide a "safe" blood for this purpose, group 0 treated with A and B substances.

Transfusion -As the elective transfusion of blood and blood derivatives has grown, the "rule-of-thumb" indications for this form of therapy have tended to disappear It is known that certain specific physiologic indications point to the use of one or another agent for transfusion All who are concerned with the transfusion of a patient in shock or in marked hypoproteinemia would like to have periodic red blood counts, hemoglobin determinations, hematocrit values, and plasma protein determinations throughout the course of the transfusion and immediately Most persons realize that although after it these determinations are eminently desirable, The laboratory they are highly impracticable staff needed to follow a single patient is rarely available at the appropriate time, or if available, is terribly overburdened

Fortunately, an extremely simple procedure has been evolved by Van Slyke, and his associates, which permits the determination of the hemoglobin, hematocrit, and plasma protein values in a matter of minutes, with only the simplest of laboratory apparatus, at the bedside or in the operating theater The principle 18 These values vary with the specific gravity of the plasma and the whole blood The specific gravity of the latter is determined by placing a drop of oxalated blood into each of a series of copper sulfate solutions of known specific gravity The specific gravity of the whole blood corresponds to that of the solution in which the drop of blood remains suspended for a period of ten seconds and does not rise or sink. The sample of oxalated blood is then centrifuged and the specific gravity of the plasma is deter

mined in the same manner When the two values are known, the hemoglobin content, the hema tocrit value, and the plasma protein value may be read directly from a previously prepared line chart.

The accuracy of the values determined in this manner is as great as that obtained by the more laborious laboratory procedures. method is simple and rapid, the only technically difficult step is the initial preparation of the standard solutions. The value of the information gathered, however, is sufficient to warrant the effort entailed in their preparation central laboratory would be performing its proper function in supplying such standards

Certain problems associated with a transfusion service have been reviewed. Some have been solved and others will be by the results of further experimental studies. New problems will arise, and it is hoped they can be dealt with when the time comes.

NORMAL SKIN HARBORS MILLIONS OF GERMS WITH POWER TO HARM

A person's skin harbors millions of bacteria, some beneficial, others with power to produce infections at

the first lowering of skin resistance, according to Donald M. Pillsbury M. D. of Philadelphia. Writing in the November 23 issue of the Journal of the American Medical Association, Dr. Pillsbury from the Department of Dermatology and Syphilotogy University of Pennsylvania Medical School, states that the "normal human skin harbors an according to the American Medical School, states that the "normal human skin harbors and states" and states that the "normal human skin harbors and "normal human skin human skin harbors and "normal human skin h enormous number of bacteria which are ordinarily harmless, When the integrity of the human ekin is distributed, harmful bacteria readily become well established residents of the diseased area.

The Army Medical Corps placed skin infections high on its list of disabling diseases. 'During the year 1944," states the author "the number of hospital admissions because of diseases of the skin varied between 3,731 and 10,399 for each 100 000 troop strength in different theaters of operation. These figures do not include admissions to the sick list in field medical stations or dispensaries, in which the number of dermatologic patients varied between 15

and 60 per cent of the total.'
Although Dr Pillsbury feels that "certain striking advances in the treatment of cutaneous infection have been made during recent years, he points out that 'a noncensitizing and completely satisfactory

method of treatment is not yet available.

Reviewing the present treatment methods, the author suggests that 'in the management of cuta neous diseases which are characterized by inflam matory reaction, it is important to avoid the use of measures which may further irritate the skin and to recognize and treat bacterial invasion promptly It cannot be emphasized too strongly that the use of chemical irritants or of highly sensitizing compounds on infected inflamed skin will result in severe reactions, and in many instances may lead to prolonga tion of partial disability over a period of weeks or months.

"Instances of this are regularly seen. In partic ular tincture of iodine should never be used it is a cauterant and skin-sensitizer and too frequently adds to the burden under which the diseased skin is

already laboring.

Two rather widely used drugs which have proved to be highly irritating and sensitising to the skin are penicillin and the sulfonamides. Referring to peni cillin, the author states that 'the present incidence of sensitivity reactions is apparently over 15 per cent and this percentage may increase as more persons are exposed to the drug.

In speaking of the sulfonamides Dr Pillsbury states that "local application of sulfonamides to sites of superficial infection has little or no place in present day therapy While the development of sensitivity in a significant proportion of patients can be pre-vented by using sulfonamide continent only for pri mary acute superficial infections and for periods of not longer than five days, experience has shown that it is impossible to insure observation of those precautions in practice. Sulfonamides by mouth still retain a definite place in the management of certain acute and chronic infections of the skin and can ordinarily be given without severe reactions, pro-vided that reasonable procautions are exercised."

The internist is a specialist in the diagnosis and treatment of all the diseases overlooked by the rest of the specialists.

He is a general practitioner with a reputation. Photomicrographs Westchester Medical Bulletin. November 1946

PREMATURE CLOSURE OF SUTURES OF CRANIAL VAULT—A PLEAFOR EARLY RECOGNITION AND EARLY OPERATION

LESTER ADRAN MOUNT, M D , New York City

(From the Department of Neurosurgery, Neurological Institute and Vanderbilt Clinic)

PREMATURE closure of any one or more of the sutures of the cranial vault results in marked abnormality in the shape of the skull and, hence, the brain When a suture is prematurely closed, growth of the skull perpendicularly to this suture is markedly restricted, and compensatory overgrowth takes place at the open sutures to allow space for the progressively growing brain Early closure of the sagittal suture, therefore, results in a long narrow skull (Fig 1), closure of coronal sutures, in a broad, short, and occasionally high skull (Figs 2 and 3), and closure of both coronal and sagittal sutures, in a high skull Other changes in the cranium also appear when the coronal suture is closed at an early date (Fig 4) The anterior fossa is short and its floor is oblique, and the orbital roof may be depressed The orbits become shallow, widely separated, and eyes promi-If the deformity becomes sufficiently great, marked exophthalmos occurs, and luxation of the eyeball has been reported 1

The etiology of this condition is unknown Fetal syphilis, inflammatory process of the meninges and bone, disturbed function of hypophysis, and disturbance in the disposition of germinal layers in early embryonic life? have been suggested as the cause. An hereditary factor is suggested in the many reports of its appearance in members of the same family. I examined two members of a family in whom it had occurred in six persons representing three generations. Associated hereditary or congenital stigmata have frequently been reported?

The condition may be recognized at birth Suspicion should be aroused by the shape of the head. On examination a ridge is frequently palpable over the closed suture and no movement of the adjacent bones is possible. The diagnosis can be confirmed by x-rays of the skull.

So long as compensatory growth of the skull occurs at the open sutures, nothing other than a markedly abnormal shape of the skull results, but when decompensation appears the patients develop increased intracranial pressure as evidenced by headaches, vomiting, mental deterioration, failing vision, and occasionally convulsive seizures. Papilledema, optic atrophy.

Presented at the 140th Annual Meeting of the Medical Society of the State of New York, Section on Pediatrics May 2 1946 and blindness may occur Gunther³ reported optic atrophy in 91 per cent of a large series of patients Occasionally, there is disturbance of the first and eighth cranial nerves X-rays then show the added findings of convolutional atrophy, thinning of the inner table of the skull, and depressed orbital plates

The only treatment is, of course, operative. Lannelongue' in 1890, and Lane in 1892' suggested cramotomy or linear cramectomy, but the treatment was unfortunately used in microcephaly and in incurable forms of idiocy with the result that the procedure fell into disrepute Sharpe⁶ in 1916 reported 4 cases successfully reheved by bilateral subtemporal decompression. Levine⁷ reported that in 1916 Cushing performed a unilateral subtemporal decompression which benefited the patient for twenty years but, subsequently, the decompression was enlarged, and the following year a subtemporal decompression wasperformed on the other side The patient was relieved of headache and dizziness but there remained permanent visual impairment Bauers in 1932 advised removal, in two stages, of a ribbon-shaped section of bone around the entire head Keegan performed circular cramectomy according to Bauer's technic except for the sparing of a 3 cm area in the occipital region and combined subtemporal decompression and crucial craniectomy, with reported success in both cases Towne^{10,11} in 1927 described the most logical type of operation—a preventative one, that is the removal of a 2 cm strip of bone adjacent to the prematurely closed suture in the first three months of life This allows the skull to develop normal contours and to prevent the occurrence of visual, mental, or hearing difficulties Dandy1* in 1943 described an operation which consists of enlarging the cranium by lifting the greater portion of each side of the skull and allowing it to be hinged near the midline The operation was performed in two stages

The time of operation suggested by Faber and Towne seemed logical and the earlier the better for the brain doubles its weight in the first seven months of life and triples its weight in two and a half years Eighty per cent of the entire growth of the brain is completed in the first three years of life. It also seemed logical that since the signs and symptoms resulted from closure of the suture, opening of the closed suture

Fig. 1 Showing the long anterior posterior diam eter and the narrow lateral diameter

Fig 2. The short anterior posterior diameter and the increased height is evident.

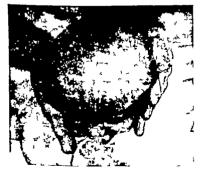

Fig. 3. The head is almost completely circular as viewed from above. The anterior posterior diameter is decreased and the lateral diameter is increased.

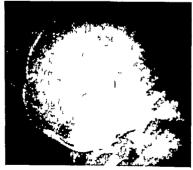

Fig 4 The coronal suture is closed The floor of the antenor fossa is short and oblique. The orbits are shallow

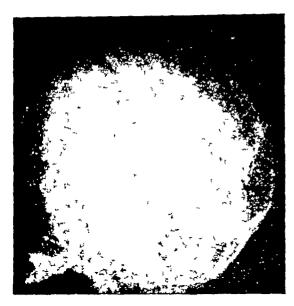

Fig. 5 X-ray picture taken a few days after operation. The coronal suture has been opened.

should be the best treatment Accordingly, a strip of bone 6 to 10 mm in diameter was removed at the suture, thus opening it in its entirety (Fig 5) No significant bleeding from the sagittal sinus was encountered. The dura separated readily from the bone beneath the closed suture. This procedure is the least extensive of any which have been described.

The following is a report of 6 cases

Case Reports

Case 1 -J H, aged seven and a half months, (Figs 2 and 3) was admitted because of deformity of the skull She was born after a normal gestation period and labor of twelve hours. Delivery was spontaneous and the child breathed spontaneously She weighed seven pounds, three ounces She took her feedings well from the beginning and moved all extremities well. The baby was constipated at first. At the age of five weeks, she suddenly stopped breathing and turned "blue and cyanotic" This lasted for what the parents believed to be a few There were no convulsive movements although there was an increase in the tone of all the muscles Her eyes were open and she stared straight ahead. There was no recurrence of this episode

Examination—General physical and neurologic examinations were negative except for the shape of the head. The anterior posterior diameter of the skull was shortened and the lateral and vertical diameters were increased.

X-ray of the skull showed complete closure of the coronal suture bilaterally, the anterior fossa was short, measuring 4.4 cm from the anterior extent of the sella turcies to the inner table at the junction with the floor of the anterior fossa in the midline. The anterior posterior diameter of the skull was

Fig 6 What appears to be a new suture with interdigitations is demonstrated X-ray was taken eighteen months after operation (Case 3)

short measuring 15 cm, the longest diameter from the inner table of the frontal bone to the inner table of the occipital bone. The vertical diameter was long, measuring 10 5 cm from the petrous pyramid to the inner table at the junction of the coronal to the sagittal sutures. The lateral diameter was 13 4 cm. The sagittal and lambdoidal sutures did not appear unusual

Psychometric Examination—On two standard test batteries, she measured at or above her chronologic age The Gesell and Kuhlmann-Binet tests were used

Operation —Under local ether anesthesia, the entire coronal suture was opened from the squamous suture on one side to that of the opposite An opening was made which measured between 6 and 8 mm. in diameter

Course—The patient withstood the operation well and was discharged from the hospital on the seventh postoperative day. A psychometric examination performed eighteen months after operation showed the child to measure in the superior range as tested by the Stanford-Binet and the Merrill-Palmer tests. General physical and neurologic examinations were normal. On x-ray of the skull, eighteen months after operation, the antenor posterior diameter was 17.4 cm., the lateral drameter was 14.5 cm., the height was 11.7 cm., and the anterior fossa was 5.4 cm.

Comment —There was improvement in the contour of the skull. The anterior fossa became relatively longer and less oblique. The skull lengthened 2.4 cm. while the width increased only 1.1 cm.

Case 2 -G P, aged five months, had an abnor

mally shaped head

The child was full term and delivery had been normal He breathed spontaneously, birth weight was seven pounds, eight ounces, and there was no cyanosis The mother had toxemia of pregnancy

Development was apparently normal except for some delay in holding up the head.

Examination.—General physical examination was nirrely normal except for the abnormally shaped tead. There was elongation of the head in the interior posterior diameter flattening in the lateral nameter and there was a ridge along the sagittal siture and no movement was possible between the we parietal bones. Neurologic examination showed to abnormalities.

V-rays of the skull showed the calvarium to be longated in the posterior anterior diameter 16 ...
m. and shortened laterally 11.5 cm. The height was 10 cm. The superior levels of the cranium were arrow. The coronal and lambdoidal sutures were pen. The sagittal suture was visible posteriorly rut unusually narrow and closed completely an criorly. The bone at the site of the anterior fonta tells bulged externally.

Psychometric Examination —The child was very ittle, if any retarded as examined by the Gesell

Operation —Under local other anesthesia, the significal acture was found to be completely closed and was responded a section of bone 8 mm. in diameter was removed.

Course.—The patient withstood the operative procedure well and was discharged on his eleventh postoperative day. Psychometric examination per formed twenty months after the operation showed the child to measure well above his chronologic age this intelligence quotient was rated at 119. He was examined by the Stanford Binet and Merrill Palmer tests. General physical and neurologic examinations revealed no abnormalities. X ray of the skull showed the anterior posterior diameter to be 20.2 cm. the width 13.1 cm. and the height 11.7 cm.

Comment.—This was the first patient operated upon. The skull continued to grow more in the anterior posterior direction than in the lateral diameter. The explanation for this is not clear

Case 5 — V L aged one year was examined because of a queer shape of head.

At birth it was noted that the child s forehead was very prominent, that the bindge of nose was sunken, and that the tip of the nose was turned up. She was the second child of healthy parents. The gosta toen period was normal. The child s head and pla cents were wedged in the cervix and labor lasted a week. Version and extraction were then per formed without forceps. The child sat up at seven months, but did not stand. She cooed, prattled and smiled

Examination—General physical and neurologic examinations were normal except for the shape of the head. The head was increased in its vortical and lateral diameters and shortened in its antenor posterior diameter. The forehead was prominent and the eyes far apart

Tays of the skull showed the greatest antenor posterior diameter was 17 2 cm. lateral 15 3 cm. height 12.5 cm., and length of the anterior fossa 4.6 cm. The forehead was unusually high and the anterior fossa was short. The coronal suture was prematurely closed while the asgutal and lambdodal sutures were open. The impression was premature closure of the coronal suture.

Psychometric examination showed some retardation. The Kuhlmann Binet and Gesell tests were used

Operation —Under local ether anesthesia, the coronal suture was reopened from the squamous suture of the right ade to the squamous suture on the left side. A section of bone 6 to 8 mm. in diameter was removed.

Course—The patient was discharged on the seventh postoperative day Psychometric examination eighteen months after operation showed the patient to be within average range. General physical and neurologic examinations were normal x-ray of the skull eighteen months after operation was interpreted as follows—"The coronal suture into which was first recognized apparently reforming at the operative site on the films taken three months ago is now clearly seen throughout the upper two-thirds of the operative area. The greatest anterior posterior diameter was 10 0 cm., the lateral diameter 10 4 cm. the height, 13 cm., and the length of the anterior fosses 5.2 cm (Fig 6)

Comment.—In spite of the fact that this patient was one year of age when she was operated upon, eighteen months after operation her head had enlarged 2 7 cm. in the antenor posterior diameter while enlarging 1 1 cm. in the lateral diameter. The antenor fossa longthened relatively more than the middle fossa and the obliquity of the floor of the antenor fossa became loss.

Case 4 —The patient A. F., aged three months (Figs. 7 and 8) had an abnormal head.

The patient was one of twins born one month prematurely after a seven-hour labor. Presentation was breech, instruments were used and mild resuscitation was necessary. He weighed 4 pounds, 4 ounces. The clongated anterior posterior diameter was noted at birth. The child took the bottle poorly at first and gavage was necessary starting on the tenth day of life. He had four to seven stools daily regurgitated frequently, lost weight, and had one cyanotic spell. The formula was changed and the patient became stronger and gained weight. He remained in the hospital from birth until after operation.

Examination.—General physical and neurologic examinations were negative except for the shape of the head.

Y-ray —The calvarium was deformed and exhibited a long anterior posterior and vertical diameters with shortening of the transverse diameters at all levels. The anterior posterior diameter was 15.2 cm. the lateral, 9.3 cm. and the height, 8.5 cm. The sagittal suture was already closed and there was thickening of the edges of the parietal bones at the vertex. The anterior fontanelle was open but the posterior fontanelle appeared to be closed. The lambdoidal suture was wide, as was the coronal. The mendosal sutures were still widely open.

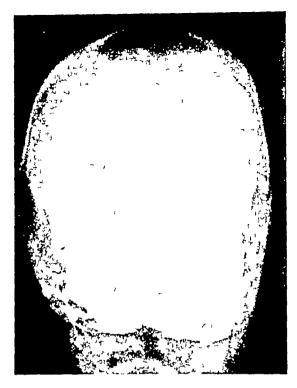

Fig 7 X-ray taken six months after opening of the sagittal suture. There has been marked spreading of the edges of the parietal bones and some regrowth of bone has partly covered this defect

Psychometric examination was not performed Operation —Under whiskey-nembutal anesthesia the sagittal suture was reopened. A section of bone 6 to 8 mm in diameter was removed

Course—The baby withstood the procedure well and was discharged on the tenth postoperative day Six months after operation, the general physical and neurologic examinations were normal. X-ray showed the anterior posterior diameter to be 16 2 cm., lateral diameter, 12 2 cm., and the height, 10 5 cm. The operative defect along the sagittal suture was wider than that shown a few days after operation. The margins of the defect were irregular and ballooned outward slightly. There was some regrowth of bone along the edge of the defect (Fig. 7)

Comment —The skull had become reshaped to a considerable degree—It had enlarged only 1 cm in the anterior posterior diameter, while enlarging 29 cm. in the lateral diameter (Fig. 8)

Case 5 —The patient, J G, aged 21/2 years, had chief complaints of abnormal development of head, convulsive seizures, and retarded development

She was born after a normal gestation period, labor was sixteen hours, and presentation was breech. There was no known cyanosis at birth but twenty-four hours after delivery, she suddenly turned blue and was placed in an oxygen tent for four days. It was believed that she had a convulsion at the time. She took her feedings poorly. She had measles at 3 months, pneumonia at 9 months, and had had almost continuous crusting of the nares.

Fig 8 Photograph six months after operation The width of the skull had increased 2 9 cm.

since birth. She did not hold her head up until 7 or 8 months, sat up at 18 months, stood at 20 months, walked at 24 months, and was able to say "dada" only, at 2½ years — An umbilical hernia was observed when the child was twenty months old. At the age of ten months, the patient began to have generalized convulsions lasting about four to five minutes and recurring two to three times per month. These convulsions ceased when the child was 1 year old

Examination —General physical examination showed an underdeveloped and undernourshed white child with an abnormally shaped skull. There was an increase in the anterior posterior diameter and a diminution in the lateral diameter. An unbilical hermia was present. There was a dimple in the midline in the lumbosacral region. Many crusts were present in the naries and the latter appeared dry. On neurologic examination, the gait was very unsteady. There was a right central facial paress Otherwise, neurologic examination was within normal limits.

X-ray of the skull showed shortening of the transverse diameters, especially in the higher levels of the calvarium, measuring 13 2 cm, increase in the anterior posterior diameters to 19 2 cm, and increase in height to 12 cm. There was complete synostosis of the sagittal suture and hyperostosis underlying the full course of this suture. The coronal and lambdoidal sutures were normally open. The convolutional markings were slightly increased

Psychometric Examination —There was retardation, but a definite grading was not possible because of the child's extreme irritability and resistance toward the examiner

Operation.—Under local ether anesthosia, the sagittal suture was reopened. A section of bone, 8 to 10 mm. in diameter, was removed. There was no significant bleeding from the superior sagittal

Course -The patient's postoperative course was not remarkable and she was discharged on the ninth postoperative day She had no more convulsions. Prychometric examination performed twenty-one months after operation showed the patient a mental status to place her in the retarded range. She was examined by the Stanford Binet and Kuhlmann Binet tests. \ rays taken twenty-one months after operation showed the anterior posterior di ameter to be 10 6 cm lateral diameter 18 9 cm. and height, 12 cm. The operative bony defect had apparently closed over On examination there was a slight depression along the sagittal auture. There was crusting in the nares The voice had a nasal quality General physical and neurologic examina tions were otherwise negative

Comment.—This child was apparently born mentally defective. Even though the operation was performed at the age of 21/s years, the skull en larged more in width than in length in the twenty one months after operation.

Case 6—R. G aged 6 months, was born with peculiar shaped head and drooping of the left eyelid (Fig. 9)

The child was prematurely born at eight months is second child of a normal mother. The gestation strod was complicated by 'kidney trouble and semia which were controlled by medical treatment he presentation was breech the labor was one and se-half hours, and instruments were used in dovery. There was no difficulty in getting the baby breathe. The birth weight was 4 pounds 4 ½ unces. He began to follow objects with his eyes to me month. The left eye which was closed at

birth opened but less widely than the right. He did not sit up alone.

Examination.—General physical examination was negative except for the abnormal shape of the head Tho bend was elongated, narrow and short in height with a large occupital bulge. A ridge was palpable along the sagittal suture and no movement was present between the two panetal bones. Neurologic examination was normal except for ptosis of the left eye sluggish reaction of the left pupil to light and limitation of superior inferior and medial gaze on the left.

Y Rays.—The skull was short in its vertical diameter elongated and narrow. The anterior fontanelle and motopie sutures were open and a short segment of the saguttal suture behind the anterior fontanelle was open. The posterior three-fourths of the saguttal suture were oblitorated. The anterior posterior diameter was 18.5 cm., lateral diameter 11.3 cm. and the height. 11.5 cm.

Psychometric examination was unsatisfactory but suggested serious retardation. Kuhlmann-Binet test was used

Operation.—Under other anesthosia, the sagittall suture was reopened. A section of bone approximately 1 cm. in diameter was removed.

Course—The patient withstood the operative procedure well and was discharged from the hospital on the fourth postoperative day. Four months after operation the patient was still mentally retarded and the left third nerve paresis remained. The x-rays showed a marked difference in the shape of the skull. The anterior posterior diameter was 19.5 cm the lateral dameter 13 7 cm and the height, 12 3 cm. This resulted in a more normal rounded appearing head. There was considerable new bane formation at the operative site (Fig 10)

Comment -In four months from the time of

Fig. 9 Child aged aix months, with premature closure of the sagittal suture.

Fig. 10 Same child shown in Fig. 9 Photographs taken four months after operation

operation, the skull assumed an almost completely normal contour There was considerable spreading of the operative opening in the parietal bones with new bone formation covering a portion of the resultant defect The skull enlarged 25 cm in its lateral diameter and only 0 8 cm in length

Discussion

Six cases were reported, four involved the sagittal suture and two the coronal The best results were obtained in the patients in whom the operation was performed earliest youngest patient operated upon was 3 months of age, and the oldest 21/2 years In the former, six months after operation the skull was essentially normal in contour, while in the latter, twenty-one months after operation the head had enlarged more perpendicularly to the prematurely closed suture than it had in the anterior posterior direction None of the patients had any signs or symptoms of increased intracranial pressure before operation, or developed any signs or symptoms of such after operation Two who were retarded mentally before operation were still retarded twenty-one months and four months, respectively, after operation One who by psychometric examination was rated "little if any retarded" had an intelligence quotient of 119, twenty-two months after operation In two of the patients, what appeared to be a new suture line with interdigitations, developed nearly as could be determined by x-ray, this appeared to be a normal suture and thus far has remained open in both cases eighteen months after operation In two others, a thin layer of bone representing only the outer table has In the last two, it is too bridged the defect early to know what will happen to the opened The passage of time will show whether or not these early favorable results will be maintained

Summary

- The diagnostic criteria for recognition of premature synostosis were outlined
- A new and more simple operative procedure was described
 - Six cases were reported
- A plea was made for early recognition and early operation in order to obtain the best results

MARY PUTNAM JACOBI FELLOWSHIP

The Women's Medical Association offers a Mary Putnam Jacobi Fellowship for medical research for the year 1947 This fellowship of one thousand dollars (\$1,000), available October 1 is open to any woman doctor either American or foreign who is a graduate of a reputable medical school Five hundred dollars is available October 1, with the second five hundred dollars following at the end of the fourth month There is also the possibility of a third five hundred dollars being awarded if the committee judges the work done to be of special merit

Application for this fellowship must be filed with the secretary of the committee by March 1, 1947 and will be acted upon by May 1, 1947 Application must be accompanied by (1) a recent report of the applicant's health, (2) transcripts of her college and medical school records, (3) personal letters of recommendation from two or more doctors under whom she has studied, (4) a statement from the person under whom she proposes to study of his interest in her project, (5) a statement by the applicant herself of the problem she proposes to investigate (8) a statement by the shape of the problem she proposes to investigate, (6) a recent photograph All of the above data must be at hand before application is considered.

The recipient of the fellowship will be expected to give her full time to the study of her problem and to make reports to the committee at four-month intervals with a view to publication if suitable at the end of her research.

Application blanks may be obtained from the secretary of the committee, Phebe L DuBois, M.D., 150 East 73rd St, New York 21, NY

KEYSTONES IN PSYCHOLOGIC THINKING ABOUT YOUNG CHILDREN

NINA RIDENOUR, PH D, New York City

WHEN certain basic ideas about children are well understood by parents, many children's problems work themselves out like magic, or better still, never occur at all. Pedia tricians are principally gods to parents. They are perhaps in a more strategic position than any other professional group to get across the right ideas at the right times. I have tried to record here what seem to me some of the keystones in thinking which pediatricians should try to build into parents' concepts of children.

The Search for Causes

First of all, I would name an attitude of searching for causes, as opposed to the mere treating of symptoms. It may seem fatuous to belabor this point before a medical group. Cer tainly medicine these days is consistent in looking for causes. In the attuations in which it has not yet found the causes, it is obliged to treat symptoms but it is not usually confused between the two. For instance, the physician wastes little time applying ice packs to bring down a fever he looks for the infection. He may prescribe nose drops for relief during a cold, but he would not for an instant claim to be treating the cause of the cold. Even the lay public has grasped this point well with respect to physical ailments.

And yet how often in the psychologic problems of children do people tackle only the symptom without any effort at finding the true cause the rest of this paper could easily be given over to common examples of this error Let us take just two or three Thumbsucking, for instance. To treat the thumbsucking itself is to treat the symptom. Parents may engage in polemics as to the relative ments of mits thumb-guards, elbow splints, putting pepper or bitters on the fingers tying the hands, or shaming the child All are bad. All are treating the symptoms only (True, some of them may work Bad methods often do But they are nonetheless destructive.) much sounder is a little prophylaxis. Research notably that of Dr David M Levy, indicates that many cases of thumbsucking can be traced to insufficient sucking with the lips in early in-The pediatrician may help the parents avoid or at least decrease the severity of thumbsucking if he plans the care of the infant from the beginning in such a way as to assure opportunity

Presented by invitation at the 140th Annual Meeting of the Micdical Society of the State of New York Section on Pediatrics, May 2 1945. for sufficient sucking and perhaps makes a point of increasing sucking time when thumbsucking first begins.

Sleep problems are another example Take the youngster I have been seeing recently He is two and a balf years old He has the household in an uproar because he gets out of bed twenty or thirty times every night and he will not settle down before twelve or one o clock. His father gives him phenobarbital every night, his mother gives him periodic every morning But the solution is not going to lie in trying to stop him from getting up It will lie in attempting to change the total situation including the parents' attitudes and in providing some of the missing satisfactions which will reach the root of his behavior

Another example of a type of problem frequently handled directly instead of indirectly is the child who at two or three must take a certain blanket with him wherever he goes, can never go to sleep without it, and perhaps runs to get it a dozen times a day when things go wrong. Too often the method of handling thus is either to take the blanket away or shame him out of using it And yet the important thing is to analyze what is wrong with the child's environment which makes him want to cling to this infantile comfort.

There will be many times when a direct attack on a symptom will work as far as that symptom is concerned, but if it is a destructive method for the child himself, he is worse off than before The question "How can I stop him?" implies treating the symptom It is usually not the best approach 'Why does he do it?' suggests a search for the cause This question is at least more likely to send one off in the right direction looking for the answer

Psychologic Needs

The search for causes leads directly to an analy sus of needs. So much has been written about the needs of children in recent years that I shall touch it only lightly here. The physical needs are well understood, even if not always well supplied. The psychologic needs, too, are often listed but their implications are less well understood. I shall name a few needs, not as a comprehensive list but in order to be sure that we are all thinking about the same things love, affection, acceptance response, companions his own age, opportunity to explore to "find out," to have new experience, permission to get dirty, to make noise to express hostility, freedom from overstimula

tion and from adult anxieties, the privilege of being cared for by understanding adults and of being allowed to grow at his own pace

The reason why an understanding of psychologic needs is one of our keystones is that in most problems of children, an investigation into causes will reveal needs that are not being satisfied. The formula, then, becomes not only "Look for the cause," but "Look for the cause in unsatisfied needs." The real need is not always obvious by any means. In fact, because of the nature of the problem, the tendency may be to handle it in such a way as to intensify the original, unsatisfied need.

For example, suppose that a child is a "mamababy," dependent, infantile I recall a short scene I witnessed in a well-baby clinic not long A husky, four-year old came in, shy and scared, peeking from behind his mother's skirts The mother was pregnant with another child answering the receptionist's questions, the mother admitted, with shame in her voice, that the four-year old still had to have a bottle The receptionist then said, "That's terrible must break him right away Maybe it's a good thing you have another baby coming so you won't have so much time to give to this one be sure to tell the doctor" She continued in this vein for two or three minutes, repeating several times "Be sure to tell the doctor", and then turned to the child saying, "Aren't you ashamed, a great big fellow like you, still taking a bottle"

Now it was obvious here that she was only intensifying the guilt and anxiety of a mother already insecure and inadequate, to say nothing of what she was doing to the child If the mother attempted to carry out her recommendation about "breaking him right away," the child would be precipitated into still more traumatic experiences, along with the ones he was already facing 'Clearly what the child needed was more love and reassurance from the mother, not less, and wise, gentle handling to help him over the hurdles ahead (Incidentally, to digress for a moment, I like to cite this case as an example of the fact that it often takes just as long to give bad advice as good, and that a constructive job with a parent can frequently be done in the same number of minutes it takes for a destructive job.)

To cite briefly another type of case in which poor handling often intensifies the original need, suppose that a 5- or 6-year-old persists in being cruel to a younger brother or sister, hurts him, teases, breaks up his things. The tendency often is to sympathize with the younger sibling, especially when he is hurt, to scold and shame the older child, and remind him how big he is. Yet this type of treatment will only increase his feelings of jealousy, it will make him feel still more

displaced, that he does not belong, that no one loves him And these were the feelings which caused his bad behavior in the first place. In order to satisfy his real needs, it is necessary to give him extra love and attention, assure him that he is just as important as the baby, that he has not been pushed aside.

The Dynamics of Emotion

Any study of needs leads directly to study of emotions, and this is the most complex and most important area there is in the study of human behavior

That idea still shocks many Children hate They cannot face it in themselves, and people therefore they cannot accept the idea that chil dren feel it I recall the nurse who said, her voice trembling with consternation and disbelief, "Do you mean to say that little children hate? Why, a little child can't hate!" And I think of the horrified mother, describing with smug disapproval how a friend's child had called his teacher "You dope!" The mother added, "I don't think my boys ever even have such thoughts!" But an outsider could see many signs of smouldering resentment in her boys-boys who would not dare call the teacher "Dope"—but who had had the proprieties so impressed upon them that countless more serious problems were evident daily What this mother failed to realize is that it is far better for a child to express hostility than to push it When expressed, it will not last forever, when repressed it festers and grows until it does many kinds of damage to the developing person-

Yes, little children feel hate And it is all right for them to feel hate Furthermore, it's even all right for them to feel hate towards their own parents After all, what is the chief cause of hostility? Frustration And who is the principal frustrating agent in the child's life? The parent. The parent is also the chief source of satisfaction But the two—love and hate—can exist side by side (The same is true of parents' feelings about children) Parents must grasp this "But he loves the baby" they will say Yes, and at the same time he resents him, wishes he were out of the way, in other words, hates him The two are not mutually exclusive—in fact, it is almost better to say that they are mutually inclusive

The worst trouble of all starts when the child not only dares not show his hostility but dares not even feel it, because to do so would call down the danger of losing the most important thing in the world, the love and protection of his parents. It is in this area of children's feeling that parents particularly need help from doctors

First of all, it is necessary to help parents to understand the normalcy of hostility and the

fact that not only do all children feel it, but that it is sound, psychologically and biologically sound. Then it is necessary to help parents to accept it, without attaching moral values without taking it as a personal insult, without looking upon it as "naughty," a kind of behavior that must be curbed at all costs. Next they need belo in learning how to give the child constructive outlets for his aggression, how to channel it (One little device which the physician can suggest to the parent for use in moments of aggression or destructiveness is to say, "I know you feel like hurting Jimmy but I shall not let you do it I would not let him hurt you." or "It's all right for you to feel like breaking the dishes but you must not do it.")

Finally, parents need help in learning how to "set limits" And there is not a more difficult problem in the whole field of child care. There are no pat answers! It is a constant daily al most hourly, problem in caring for children. It is to be hoped that in these days no statement setting forth the necessity of letting the child express his aggression is going to be interpreted as an argument for "license," or "letting the child do as he pleases." Of course, he has to learn what he cannot, must not do Teaching this without creating unnecessary and destructive frustrations is as challenging a problem as any the parents will ever meet, and one on which they need constant guidance from the pediatrician

Study of emotion leads one also into study of fears and anxiety and the relation of these to hostility Let us take just a moment to remind ourselves of a few salient points. The child is dependent on the adult for his very existence He will be cared for he can survive, only if love is there Biologically loss of love can mean loss of Psychologically, fear of loss of love is the basis of anxiety which in turn is the root of all neurosis Therefore, in order to thrave the child must have love. If parents have love they will give it and many of their other mistakes will be canceled Love is an emotional not an intellectual process If they do not have it, they can not give it. To exhort them only increases their guilt and results in further confusion for the child. Some parents do not love their children at all and some love them incompletely or inconsistently That idea, too, still shocks some people. But it is one of the facts of life. It must be reck oned with.

Man is a biologic animal. That statement will not be contraverted. But man is also a creature of smotions. And it is his emotions which get him into most of his trouble. It is always regrettable when preoccupation with man, the biologic creature, leads to neglect of man, the emotional creature.

Normal Expectancies

One valuable aid to prophylaxis is knowing what to expect of the child at each age There are some highly intuitive parents who scarcely need guidance in this at all They are sensitive enough, alert enough, and sufficiently free from anxiety to accept the child as he is, to respect his individuality, to let him grow at his own pace They do not hold him back when growth is push ing him forward, they do not push him forward into changes for which he is not ready. Above all, they do not try to fit him into preconceived natterns of behavior foreign to his nature or standards beyond his level of development But few parents are quite this wise Therefore they need the physician's help in being prepared for change, and in ordinary interpretations of what children are like.

Parents rarely expect unreasonable things of children in physical achievement. They do not child the month-old baby because he cannot sit up, or punish the 6-month-old because he does not run and jump, or shame the two-year-old because he cannot play the piano. And yet, they expect things just as unreasonable as these in other behavior. They expect conformity and consistency. They expect young children to be quiet and polite, and clean and considerate and not to show their feelings, especially their hostile feelings.

It is no simple matter to explain expectancies to a mother so that she will have a clear idea of what to look for, but will not fall into the "tyranny of the norm"-to use a phrase coined by L. K. Frank. Here is where the pediatrician can be especially helpful. He will try to reassure the overanxious mother, relax the rigid mother, and impress the too casual or negligent mother He will take time to explain the wide range of nor maley and try to break down ideas of an exact moment in age when each change must occur This is sometimes harder to do than it sounds One important result will be that unless the mother is too neurotic to accept his guidance he will convey the idea of letting the child grow at his own rate.

To do this, he will need to explain not only the physical but the psychologic or behavior expectancies. The alert pediatrician can foresee and prevent crises for the mother in her handling of the child, just as the alert mother can foresee and prevent crises in the child's behavior. And many of these are extremely important prophy lactically because they will forestall later battles between mother and child. Here are a few examples.

It will, for instance, save trouble later at weaning time if the physician has advised the mother

earlier to start giving the baby a little fruit juice or milk from a cup beginning at the age of 5 months or so It is reassuring for her to know that at about the age of one year, he may begin to have less appetite and become more choosey about his food Toilet training will cause fewer anxious moments if she watches her child for the signs he gives that he is ready for the next step, instead of trying to compete with the neighbor in having him trained "young" She will be more patient if she realizes that most children become more negativistic around the ages of two to three She will not try to impose unreasonable standards if assured that no 2-vearold can be expected to share his toys and take turns, and that her child will not necessarily grow up to be a selfish boor if he refuses to share at this age She will worry less about thumbsucking if she knows how frequent it is and that most children do outgrow it without difficulty is less likely to react emotionally to masturbation if she realizes that all children—all—do a certain amount of it, that it is not a perversion, and that she should not attach social and moral values to She will be less shocked when he uses some bad language at four or five if she knows how common this is and how natural

I think of the mother I saw send her 21/2-yearold son away from the table and up to his room because he picked up a piece of raw carrot in his fingers This was bad manners, and "he knew better" And I think of the mother who expected her 2-year-old to receive an introduction properly, to get up from her chair, walk over, shake hands and say "How do you do, Mr Brown" Of course, with mothers like these, one immediately wonders what their own childhood has been like, what deprivations they have had that make appearances so important to them, what factors in their lives compel them to impose rigid standards in their children. With these mothers, the psychologically oriented physician has an opportunity to play a constructive role which will benefit the child throughout his life

Technics Destructive and Constructive

Although there are innumerable times when the wisest and most experienced person will be baffled as to how to handle a child's behavior, there are certain technics which in general are to be avoided, and others which in general are to be recommended Parents are constantly seeking advice. The doctor can help by advising along some such lines as the following.

First, he will warn the parent against destructive technics Chief among these are shame, fear, and punishment Shame may bring about a change in almost any given piece of undesirable behavior but the harm done to the child's personality may

Fear and threats, too, under be incalculable mine the child's self-confidence and security and may inflict deep psychologic injuries Especially to be avoided is the threat, "I won't love you if you do that" Punishment is harder to advise about because the doctor does not want to sav "don't punish," and yet punishment is often a destructive method of handling a situation It is very likely to teach, not what the adult intends it to teach, but chiefly that this is a hard, crief The incident may be forgotten but the effects may last a lifetime Then, too, the parent may need to have it explained that there are many kinds of psychologic punishment more cruel than physical punishment

Parents also need to be helped to recognize when they are nagging, when they are creating unnecessary issues and when they are setting their standards too high, and imposing their own personalities instead of helping the child to grow in his own way. They need to be warned against expecting consistency because it is part of being a child to resist the demands and conventions of adult life. And they will need many explanations about why a direct attack on a problem, even though it seems to get the most immediate results may not necessarily be the best, and may indeed even be the worst.

As to constructive technics, these are not always as self-evident as they seem. The doctor will need to remind parents what the basic needs are and suggest ways of satisfying them. Affection, acceptance, encouragement, patience, respect for individuality, these are a few of the recommended approaches in child care which bear frequent repetition.

Attitudes Toward Parents

Parents have come in for a painful lot of critcism since the advent of the "new psychology" "Parents to Blame for Children's Behavior," shrieks a newspaper headline "Parents, Not Children, Are Delinquent, Should Be in Jail," blazons forth another "My Mother Is An Eating Problem," more subtly insinuates the title of an article in one of the slick paper magazines

It is curious that people who care a great deal about children are often harsh with parents. It is perhaps to the point for doctors occasionally to remind themselves of the cliché, "Parents are people". And it may not even be too sentimental to suggest that they remind themselves that parents were once children. They were children with the same frustrations and deprivations and conflicts that they are now trying to help their children to overcome. Scars from their early handling are now showing up in their handling of their children. Psychologists, psychiatrists, teachers, social workers—perhaps pediatricians, too—have

A PROGRAM FOR THE CONTROL OF TROPICAL AND PARASITIC DISEASES IN NEW YORK CITY

ERNEST L STEBBINS, M D, Baltimore, Maryland*

ROPICAL and parasitic diseases have been L generally considered rarities in most cities of the temperate zone, yet, in the past, there has been evidence of the not infrequent occurrence of tropical and parasitic diseases in New York City, largely in the population derived from the Part-time diagnostic service Carribean area was established in New York City about fifteen years ago and from time to time studies of the prevalence of tropical and parasitic diseases in the population were carried out Due, in part at least, to the relative rarity of these diseases and, therefore, to the unfamiliarity of the average physician with diagnostic methods, there has been incomplete recognition and reporting of most of the tropical and parasitic diseases It is, therefore, difficult to evaluate the reported incidence of these diseases during past years

At the outbreak of the present war, with the establishment of military operations in tropical areas and with the greatly increased interchange of personnel between these areas and the continental United States, the possibility of the introduction of tropical diseases required reconsideration It seemed guite likely that with the interchange of personnel and, particularly, with the rapid means of transportation provided by greatly improved air service, there would result a possible hazard to the public health therefore, considered necessary in New York City to expand the services for the recognition and control of tropical and parasitic diseases In 1943 an effort was made to expand the clinical, laboratory, and epidemiologic services for the recognition and control of tropical and parasitic diseases

In general, these diseases may be divided into three groups, particularly from the standpoint of prevention

Group 1—African trypanosomiasis and schistosomiasis, diseases which, because of the method of transmission, would not present a hazard from the standpoint of transmission within a modern city, but which might inadvertently be introduced and present a diagnostic problem

Group 2—Such diseases as yellow fever, filanasis, malaria, typhus, or leprosy, diseases which might be introduced but in which conditions for extensive spread would not be found in a modern city, but in which prompt recognition is of great

importance for the benefit of the patient and in order to prevent even limited spread

Group 3—Such conditions as amebiasis, bacillary dysentery, trichinosis, and pin worm infestation, diseases which are not infrequently encountered and transmission, even in urban populations, might be expected

In order to be prepared for the possible introduction of these varying types of diseases, it was felt necessary to establish a diagnostic and consultation service which would include the following major subdivisions (1) clinical division, (2) laboratory division, and (3) epidemiologic division

Clinical Division

This division is designed to provide for a thorough physical examination and consultation service, and integrate the laboratory and clinical It provides for clinical examination, findings careful history taking, and for the obtaining of the proper number and type of specimens It also provides for consultations for physicians or medical agencies both in diagnosis and treatment Competent advice on specific therapy is essential from a public health standpoint because such treatment is of a preventive nature as The Chincal Division also provides consultation service with respect to artificial immunization of persons contemplating visits to the tropics, and also gives information concerning protective measures within tropical areas

Laboratory Division

Completely adequate laboratory facilities for a tropical and parasitic disease service should include the following

1 Complete parasitology service including direct examination, cultures, and animal innoculation of blood or tissue fluids, direct examination of stools, urine, and sputum, skin tests for the detection of helminth infection, and examination of biopsy specimens

2 Bacteriologic service, including smears for acid fast bacilli and for the examination of cultures of stools and blood Provision also must be made for darkfield examination

3 Serologic examinations must be provided, including Wassermann and other complement fixation tests, where indicated

4 Laboratory facilities should be provided for virus studies providing for the recognition of yellow fever, psittacosis, and possibly other virus diseases

^{*}Presented, by invitation, at the 140th Annual Meeting of the Medical Society of the State of New York, Section on Public Health, Hygiene, and Sanitation, May 1, 1946

 A mycology laboratory should be provided in which studies of fungous infection may be carried out.

6 Laboratory studies in entomology may from time to time be of great importance in the

prevention of spread of infection

General provision is essential for the common chinical laboratory tests, such as blood count hemoglobin determinations, etc., which are of importance in clinical diagnosis.

Epidemiologic Division

This service should provide for the investigation of the probable source and possible transmission of all recognized cases. This involves complete epidemiologic investigation of the reportable and in some instances, nonreportable conditions discovered

In the establishment of the service in New York City, a central clinic was set up in the Washington Heights Health Center and this clinic included the services of clinicians having had experience in tropical and parasitic diseases. In the development of laboratory services and the establishment of an epidemiologic service for the city, because of the great demand by the armed forces for personnel trained in tropical diseases it was necessary to select a member of the staff of the department who had had extensive laboratory experience and to provide an opportunity for specialized study in tropical diseases which was given in the Army Medical Center and, subsequently, an opportunity for field experience was provided We were fortunate in obtaining the services of an epidemiologist who had had ex tensive training in tropical diseases These members of the staff undertook the training of labora tory personnel to provide adequate laboratory service

Reasonably adequate service has been provided in parasitology and clinical diagnosis at the clinical center bacteriology and serology has been provided through the central laboratory Entomologic consultation has been provided by the Museum of Natural History No provision has been made for virus studies and only limited provision for mycology

An effort was made to inform the medical profession in New York City of the service avail able Notices were carried in the medical society bulletins informing physicians that free laboratory service to all physicians and medical agencies could be obtained at the tropleal diseases center, that unlimited consultation service to physicians would be provided both in diagnosis and treatment. A system of telephone reporting of positive findings was established. This method of reporting provided an opportunity for the physicians to obtain telephone consultation concerning therapy, and provided a closer contact between the diagnostic service and the practicing physicians. An attempt was made to stimulate routine referrals of persons known to have been exposed to tropical or parasitic diseases through residence in the tropics. A program of professional education was set up providing for lectures to physicians, talks to lay groups and nurses, publication of material relating to the various types of tropical diseases and establishment of a training course for laboratory technicans in the diagnosis of tropical diseases.

The operation of the service really got well under way early in 1944. During that year, efforts were made to inform the medical profession of the services available. Partly because of more general knowledge of the services available and partly because of the greatly increased return of personnel from the tropical areas, the first marked increased demands upon the service were noted in 1945.

As shown in Table 1, there had been no very striking change in the number of new patients admitted to the tropical diseases center until 1945, when 3,043 new patients were admitted This marked increase is, in all probability, at least partly due to the notification of the service carried in medical society journals. The increased load on the laboratory associated with this markedly increased admission rate is shown in Table 2. Ten thousand and one specimens were examined in the laboratory during 1945, as compared with 4.350 in 1944. A partial analysis of the operations of the clinic indicated that a conanderable number of cases of tropical and parasitic diseases were occuring in New York City, not limited by any means to returning military personnel. Of the slightly over 3,000 new patients admitted, a positive diagnosis of tropical or para sitic disease was made in 791 The method of referral of the cases admitted during 1945, as shown in Table 4, was quite largely from referrals by private physicians Of the 4 043 new cases. 2 192 were referred by private physicians, 501

were referred from health department climics, and 350 were referred from hospitals

As previously stated, a considerable proportion of the cases admitted to the service had had long-continued residence in the tropics. Nine hundred and three of the new admissions in 1945 gave a history of having been born in a tropical region. A large proportion of the new admissions gave a history of recent residence in the tropics. Of those 1,593 who gave a history of residence in the tropics during the past five years preceding admission, 481 had been in military service or had been directly connected with war activities, and 1,112 were not directly connected with war activities.

It is of interest to observe the characteristics of the tropical disease findings in returned military personnel. Dr. Shookoff, epidemiologist to the service, is making a detailed analysis of the epidemiologic characteristics of the tropical diseases observed in military personnel. Briefly, some of the observations made in the study of these cases show a wide and varied tropical experience.

As shown in Table 6, of 278 patients admitted to the center giving a history of military service, more than one half, or 147, gave a history of service in the Pacific area. Fifty-seven of this number had service in the North Africa-European area, 22 in the China-Burma-India area, and 16 in the Carribean area. An analysis of the findings in 272 ex-servicemen, as shown in Table 7, shows

Acanthocheilonema perstans	_

Summary and Conclusions

Anticipating an increase in tropical and parasitic diseases as a result of the war, an effort was made to provide for chinical, laboratory, and epidemiologic consultation and service in New York City The service was established in 1943 and a marked increase in referrals to the service was observed in 1945 This increase and demand for consultation was almost certainly due partly to an increase in actual disease resulting from the return of military and other personnel from tropical and other areas that were directly war connected, and partly due to a greater knowledge of the availability of consultation service There seems to be evidence of a continuing need for this type of service in New York City and probably in other seaport or transoceanic airport cities. In all probability, the greatest number of cases of tropical or parasitic disease will be encoun tered in the next year or two, with a decline when demobilization of the armed forces has been completed, but it seems quite likely that there will be a continuing need on a somewhat reduced scale for consultation service in tropical and parasitic diseases

Discussion

Dr Hollis S Ingraham, Albany—The very excellent tropical disease control program expanded by Dr Stebbins in New York City a, obviously the result of long consideration and careful planning, and will surely prove to be an adequate solution to the problem. Dr Stebbins has covered the subject so thoroughly that there is little that I may add except to comment on the related situation with which we are confronted in Unstate New York.

The necessity of meeting the possible introduction of tropical diseases into New York State was recognized early in the war and appropriate action was taken by the various interested groups Among

the steps taken were

1 The New York State Association of Public Health Laboratories planned a series of five conferences on laboratory aids to diagnosis of tropical diseases. These were of great value since it has long been recognized that tropical medicine is laboratory medicine to a greater extent than is true of any other medical specialty.

2 The Medical Society of the State of New York and the New York State Department of Health initiated a joint program of postgraduate education, making available lectures by qualified experts to

county medical societies.

3. The Markle and Rockefeller foundations made it possible for staff mambers from each of the medical schools to attend a formal course in tropical medicine, followed by field experience in tropical America. These staff members have in turn, passed on increased and more expert instruction to medical students.

 The United States Public Health Service assumed responsibility for the control of anopheline mosquitoes in the vicinity of military establishment.

5 The State Health Department offered a short refresher course to each of its district health offers, and provided each district office with a copy of Suit's Diagnosis Prevention and Treatment of

Tropical Diseases, by Richard Strong

Unquestionably many veterans of the recent war will continue for some years to carry the incutants of disease acquired in tropical areas. The question of the public health importance of these diseases, that is the likelihood of actual epidemic spread or endemic persistence, can now be evaluated more real istically than was possible during the war years. Earlier it was quite impossible to judge accurately the gravity of your problem. We could not know the extent to which an unfavorable turn in the tide of war might lead to destruction of water purification plants, pasteurising plants, and hospitals, nor the degree to which our transportation might be impeded, or medical and nursing service curtailed.

might resort to bacterial warfare. However, we have emerged from the war with our preventive machinery quite undamaged and, indeed, strength ened in many respects. We are possessed of now weapons such as DDT and the newer animalarials and have greatly increased knowledge of control of such diseases as typhus, malaria, and plague. Many of our preventive methods such as immunization against typhus and yellow fever, have now been thoroughly tried and found to be highly effective. We have been further greatly reinforced by the return of many hundreds of physicians who have had actual experience with the various tropical diseases, and who will carry this knowledge into their private practice and extend the benefits to their collegues.

Hence it now appears that we stand on firm ground in predicting that we need fear no extensive epidemics of the known tropical diseases. There is the possibility that certain illnesses which managed to maintain a foothold in this State prior to the war may occur with somewhat greater frequency possibly because of the introduction of nower and more virulent strains. I refer particularly to amebic and bacillary dysentery, in which, however there is no cause to fear any true epidemics. There is a very real possibility of this same mechanism operating in

another nontropical disease—diphtheria. Malaria requires special consideration. malady persisted in the lower Hudson Valley until the early 20 a. During the last ten years, there have been three occasions on which two or more individuals have been infected by a single focus within The source of parasites for one New York State of these was a worker from a southern state, for another Mexican laborers, and for the third re-turned servicemen. In 1945, with 557 cases of relapsing malaria being reported among members of the armed forces and votorans, not a single instance of transmission within the State was recorded. Since Anopheles quadrimaculatus is present through out the State in some areas occurring in moderate density it is guite possible that small foci of malaria. may appear within the next two years. It is beheyed that the possibility of any extensive epidemia is so remote that we are not justified in embarking on an expensive state-wide program of anopheline destruction. Small outbreaks may be quickly sunpressed by modern methods of malaria control. Since it is believed that relapses among servicemen will have practically ceased to occur within another two years, it is believed malaria very quickly will revert to its prewar status.

It does appear then, that the tropical disease problem resolves itself largely to the prompt recognition and diagnosis of the disease in the individual, with the application of the indicated therapeutic and proventive measures. This will require an awareness of the possibility of these diseases by each practicing physician and full use by him of the available laboratory aids for diagnosis, and of public health facilities to prevent spread to others in his immediate environment.

It is apparent that the New York City tropical disease service has been established with these aims in view, and is admirably planned to provide the private physician with every aid in supplementing his offorts in controlling exotic diseases.

GIANT CELL TUMOR OF THE CERVICAL SPINE

HALFORD HALLOCK, M D, New York City

THE following case is reported because of its general interest, extensive involvement of the cervical spine, and astomshing absence of neurologic complications

Case Report

In December, 1937, the patient, S. R. P, aged 34 years, while performing in a musical comedy, slipped and fell to the floor striking the upper part of the shoulder and snapping his head and neck. He noticed sharp pain in the neck but was able to continue his performance. He continued working until February, 1938, when he was taken to the Rhode Island Hospital in Providence because of excruciating pain. Traction was applied.

X-rays upon admission, and on February 18 and 22 were reported as negative, but, on March 13 films were interpreted as showing an old injury or an anatomic variation of the second cervical vertebra

He was discharged from the Hospital on March 25, 1938, wearing a collar support

Presented at the 140th, Annual Meeting of the Medical Society of the State of New York Section on Orthopedic Surgery May 3 1946 Pain and stiffness increased and in May, 1938, he was admitted to the Neurological Institute in New York City—It was felt that x-rays at that time strongly suggested a giant cell tumor of the second cervical vertebra (Fig. 1)—A brace was applied and x-ray therapy was given

In November, 1938, it was thought that the condition might be tuberculosis and he was admitted to a sanitarium for six months. Orthopedic consultation, however, finally dispelled this conviction and he was discharged. Another course of x-ray therapy was given and support was discontinued.

His compensation case was closed in November, 1941, and he returned to work and continued at work X-rays at this time showed disappearance of the cystic bone lesion, absence of soft tissue swelling, and the development of spontaneous fusion between the first, second, and third cervicals (Fig 2)

In December, 1943, while playing in Boston, he got up quickly from a recumbent position and again felt something snap in his neck. He continued with his work until March, 1944, when he had to stop because of pain. Roentgenograms in June, 1944, revealed a disappearance of the previous mass of reparative bone and the space between the first cervical and the fourth cervical to be filled with a soft tissue mass with areas of calcification within it. Rem nants of the spinous processes of the second and

Fig 1 Cystic lesion of the second cervical with anterior soft tissue mass August 16, 1938

Fig 2 Absence of soft tissue mass and cystic lesion of bone Fusion present in first and second cervicals. October 6, 1941

third cervicals were seen posteriorly and the body of the fourth cervical had become involved (Fig. 3) A-rays, a year later, showed marked uncrease in these changes and involvement of the flith cervical. A large soft tissue mass projected anteriorly (Fig. 4)

Treatment during this period consisted of traction disthermy, and injections of vitamin B and Bromplex. From July to September 1944 he had more x ray therapy. Since 1944, he has worn a brace and has not taken it off at any time. He was warned that to do so might result in sudden dissater

He first presented himself to the writer for examnation on February 20, 1946. He was wearing a Taylor spinal brace with cervical attachment. He did not complain of any pain but only of fatigue in the neck which compelled him frequently to lie down He had some numbness in his fingertips but no sphincterio disturbances or weakness in the legs.

Examination revealed a healthy-appearing man who walked normally he was wearing a spinal brace with cervical and chin attachments. Motion of the cervical spine was not tested. No tenderness was found over the region of the cervical spine, but the patient was apprehensive and did not reliab pal pation. There seemed to be some looseness of bone in the region of the spinous processes. Bulging was not seen in the pharynx

Motor power throughout the upper extremities was good except that the grasp of the left hand was a little weaker than that of the right. No sensory changes were noted in the hands. The bicepe hu meri reflexes were both two plus, the knee and the ankle jerks were three plus.

Roentgenograms taken on March 5 1946 showed some recalcification in the involved area, particularly in the region of the third and fourth cervicals,

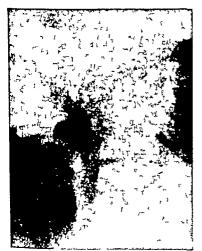

Fig 3. Recurrence of lesion with involvement of the second third and fourth cervicals. Soft tissue mass present anteriorly June 23, 1944

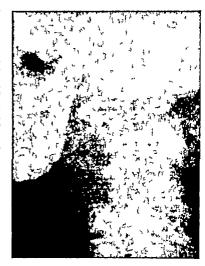

Fig. 4 Marked increase in the pathologic changes of bone and soft tissue. Involvement of the fifth cervical is now present. May 25 1945

Fig. 5 Areas of recalcification particularly in the region of the third and fourth cervicals which indicate the probable presence of reparative changes. March 5 1946

suggesting reparative changes Soft tissue swelling and apparent absence of vertebral bone structure were still present (Fig. 5)

Diagnosis —The nature of the lesion as shown by the progressive x-rays appears most likely to be a giant cell tumor, that, after apparent healing, recurred and extended into a number of the cervical vertebrae

Continuation of brace support and new x-rays in three months were advised Dr Lawson E Miller, consulting roentgenologist, did not believe that further y-ray therapy was indicated as long as reparative changes seemed to be present A biopsy was not considered advisable or necessary and would not change the type of treatment

Discussion

Giant cell tumor of bone most frequently occurs in the lower end of the femur, upper end of the tibia, and lower end of the radius It is seen, also, in the spine (Ewing) 2 In 1927 Kolodny reported that of all the cases in the Registry of Bone Sarcoma, 56 per cent were in the bones of the lower extremity, 23 per cent in those of the upper extremity and 21 per

cent in the bones of the trunk including the pelvis. shoulder girdle, and jaws. In the literature, from 1923 to 1937, Miller found 59 reported cases of giant cell tumor of the vertebrae Of these, 8 were in the cervical portion of the spine and involved in each instance only a single vertebral body This case is unique in that four contiguous cervical vertebrae eventually became involved by the process.

The lack of collapse in the face of such marked apparent dissolution of bony structure must mean that sufficient although decalcified framework still exists which in the presence of solid tumor tissue and aided by continuous brace support is enough to preserve alignment It seems certain that the brace alone is not responsible To the preservation of alignment must be ascribed the astonishing absence of neurologic complications

CHILDREN BORN WITH SYPHILIS RESPOND WELL TO PENICILLIN TREATMENT

In a study of 61 children, two Atlanta physicians have found that penicillin is effective in the treat-

ment of congenital syphilis

Congenital syphilis—a term usually associated with children who are born with the disease—is transmitted to an embryo while it is still in the womb

The infected mother's blood carries corkscrew-like spirochetes to the infant's body Many or all of the embryonic organs are affected

Drs Joseph Yampolsky and Albert Heyman, who are from the Departments of Pediatrics and Medi-cine of Grady Memorial Hospital and Emory Uni-versity School of Medicine in Atlanta, used penicillin to treat the 61 syphilitic children, according to the October 19 issue of the Journal of the American Medical Association

Thirty-two of the 61 children had simple infantile congenital syphilis Twenty-three of the 32 responded satisfactorily under the penicillin treat-ment "All 23 are clinically well, have normal spinal fluids, and exhibit no clinical evidence of the

disease," the authors say

While three of the patients died, the authors believe that the fatalities were in no way related to the Two of the deaths "apparently resulted treatment from an overwhelming syphilitic infection in premature and malnourished infants, while the third fatality remains unexplained "

In discussing the remaining 29 patients, the At-

lanta doctors say that seven were suffering from acquired primary and secondary syphilis, while the others were treated for late forms of congenital syphilis

In the 7 cases of acquired syphilis, the doctors say the patients were treated with doses of penicillin comparable to those used in adults "The syphilitic comparable to those used in adults lessons healed promptly in every case and the spirochetes disappeared rapidly," the Journal article says, adding "All of these children have been followed: for at least six months

"The results obtained with penicillin in the treatment of syphilis in children seem to depend on the nature and duration of the disease Although pemcilin appears to be effective in the treatment of infantile congenital syphilis and in early neurosyphilis, little or no response can be expected in the treatment of the late manifestations of this disease"

Drs Yampolsky and Heyman say that while the optimum dosage of penicillin cannot be determined in such a small series of cases, "we believe that a total dose of penicillin of 100,000 units per kilogram of body weight is effective in the treatment of the majority of these cases "

NOTICE TO RADIOLOGISTS

During the Annual Meeting of the Medical Society of the State of New York to be held at Buffalo in May, 1947, it is proposed in the Radiological Section to submit the x-ray films of interesting cases of chest pathology to a board of three experts for dis-cussion before the Section

Only cases of proved diagnosis may be submitted The films together with a brief résumé of the history and physical findings but without diagnosis are

to be made available to the experts in advance. Radiologists of the State are invited to submit such cases to the Secretary of the Section, Dr Carlton F Potter, 820 S Crouse Ave, Syracuse 10, by may or being them. 15 expended Section by mail or bring them to the Radiological Session the previous day This will make them available for study in advance Final diagnosis must not be Final diagnosis must not be mentioned on the sheet recording the resume of history and physical findings

MOBILIZATION OF THE ANKYLOSED ELBOW BY RESECTION

ROBERT J NEVILLE, M.D., Hackensack, New Jersey*

THROUGHOUT the years standard surgical textbooks have devoted a brief paragraph or two to consideration of excision of the elbow joint. This procedure has usually been reserved for a tuberculous iont or one which has been destroyed and left painful by generiheal or suppurative arthritis. The in cidence of tuberculous with its joint complications is last declining and, with the advent of chemother apy infectious arthritis has been sharply reduced in frequency

Since Hibbs showed that joint tuberculous could be cured by surgical bony fusion of the involved joint, the indication for excusion of the elbow joint in this malady has been reduced to the very small number of cases in which there is a persistent drain ing mnus in the presence of secondary infection. Here a simple excision will chiminate the disease and restore motion. Severe trauma and various forms of arthritis, leading to a stiff elbow often make it ad visable to mobilize that joint

In the lower extremity, stability of the various joints is of paramount importance. In the upper extremity while joint stability is also important, the ability of the extremity to function depends upon the control and the use of the hands and the elbows play an important role in permitting and assisting such function. However it is perfectly true that a single stiff elbow joint in the functional post tion does not constitute a severe handicap to most people

On the contrary a movable but somewhat weakened elbow joint will not serve a man doing laborious work as well as a solidly fused elbow in the optimum position. Excision of the elbow joint probably plays its greatest role in relieving the individual stricken with two stiff elbow loints regardless of the cause of such stiffness. In such a case it would be necessary to restore motion to only one of the joints, thereby leaving a strong stable painless upper extremity on the opposite aide for heavy lifting and such work.

Dr John B Murphy more than any individual, was responsible for stimulating interest in the role of arthroplasty of all joints including the elbow He did not favor excision because he felt that it resulted in a flail, weak joint. This opinion has been accepted by most surgeons and there is no doubt but that an arthroplasty of an elbow joint, when successful, will give a joint that is stronger and one which is less relaxed in all elements. However, in the presence of actual infection, an arthroplasty is specifically contraindicated whereas an excusion is the operation of choice when it is decided to mobilize the elbow It has also been observed that an arthroplasty does not always give uniformly satisfactory motion and the element of pain is not always com pletely eliminated. There is undoubtedly room for both the arthroplasty and excusion in caring for a stiff painful elbow joint and there is a definite indication for each procedure.

A review of the following case of rheumatoid ar thritis will serve to illustrate one of the indications for elbow joint resection. It is not offered as an end result study

Case Report

The patient, a 27 year-old colored woman, visuted the clinic at the New York Orthopedic Dispensary and Hospital for the first time on May 6 1943 Starting five years previously, the patient had experienced multiple joint pains involving the cervical spine, shoulders elbows, wrists, fingers, knees and right ankle. At the time of her first clinic visit, the right elbow joint was solidly ankly clear at a 90 degree flexion. Supination and pronation were limited. The laft telbow had only 20 degree metrics is ited The left elbow had only 20 degree motion, i.e., from 45 degrees to 65 degrees flexion and also limited rotation. The sedimentation rate was 90 mm in one hour

A course of gold therapy was administered, the sedimentation rate dropped to 40 mm. in one hour and the pain and swelling of the joints largely disappeared. However the stiffness of the elbow joints with its resulting incapacity remained and for this reason the patient had a resection of her right elbow joint on October 2 1944 seventeen months follow ing her first appearance at the clinic. The operation was performed nineteen months ago The incision was made posteriorly, the ulnar nerve was identified and carefully retracted and the lower end of the humerus and upper portion of the radius and ulna humerus and upper person of the radius and unas were subperiostenly exposed and delivered into the wound. A wide exision was performed using the motor saw The humerus was severed 1½ inches proximal to the medial epicondyle, and both the radius and ulna were severed at the same level, that is, at a point just proximal to the radial tuberosity The whole elbow joint was removed in one mass circular cast was applied with the elbow flexed to 90 degrees and with the forearm in midpronation. The cast was immediately bivalved to accommodate postoperative swelling and after two and one-half weeks exercises were begun

Soon the patient had full active flexion and exten sion but only fair pronation and supmation. The patient has now full painless, active flexion and extension but there is no pronation or suplnation due to a synostosis of the radius and ulna. Strength of the elbow though not normal is good and lateral instability of the joint is minimal. The patient has absolutely no pain in the elbow that was operated upon and she is using it for her ordinary duties.

CENTRAL DISLOCATION OF THE RIGHT FEMORAL HEAD WITH COMMINUTED FRACTURES OF THE PELVIS

MILTON J WILSON, MD, FACS, New York City

(From the Orthopedic Department New York Medical College, Flower and Fifth Avenue Hospitals, Metropolitan Hospital Division)

THE patient, H Y, a 38-year-old man, a taxi driver, was struck by a taxi on January 10, 1942. On admission to the Metropolitan Hospital, roent-genograms showed (Fig. 1) multiple comminution of the iliac, pubic, and ischial portions of the acetabulum, the right femoral head having been dislocated into the pelvis about two inches from its normal ocation.

The ramus of the ischium and the descending ramus and body of the pubic bone were also fractured

Russell traction, 10 pounds, was applied and subsequent roentgenograms (Fig 2) taken February 20, 1942, six weeks after injury, showed satisfactory reduction

The traction had not only pulled the head out of the acetabulum but the pull on the ligaments had resulted in restoration of fairly good contour of the pelvis. There was considerable overproduction of callus which resulted in limited motion.

At the end of seven and one-half weeks, the traction was removed and two weeks later he was about on crutches

After a few weeks of weight-bearing, he was noted to have flexion contracture of the right knee and hip joints, but this gradually improved In May he

Presented at the 140th Annual Meeting of the Medical Society of the State of New York, Section on Orthopedic Surgery May 3 1946

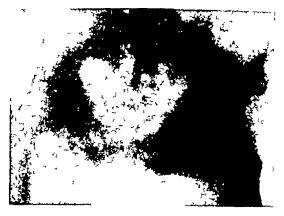

Fig 2 After six weeks of Russell traction the femoral head has been restored to satisfactory position

drove his car five miles and in July, six months after the injury, he returned to regular work as a taxi driver

Due to persistent flexion contracture he walks with the body slightly stooped but he has no pain in the hip joint or the back and can walk long distances without difficulty

Abduction and internal rotation are markedly restricted and flexion of the hip is only to 90 degrees. Figure 3 is the roentgenogram taken April 6, 1946

POSTGRADUATE MEDICAL EDUCATION

Programs arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this Section of the Journal. The members of the committee are Oliver W. H. Milchell, M.D., Chairman (428 Greenwood Place, Syracuse), George Bachr. M.D. and Charles D. Post, M.D.

Richmond County Lecture Series

POSTGRADUATE instruction for the Richmond County Medical Society is to be given Thursday afternoons 3 30 o clock, in the auditorium of the United States Marine Hospital Stapleton, Staten

United States Marine Hospital Staploton, Staten Island, New York.

On February 6 "Differential Diagnosis in Chronic Pulmonary Diseases" will be discussed by Dr. H. McLeod Riggins, associate in medicine at Bellevue Hospital and Medical director of the Tuberculosis service Triboro Hospital. Dr. A. Wilbur Duryce, associate clinical professor of medicine College of Physicians and Surgeons, Columbia University will speak on "Management of Peripheral Vascular Discusses on Externet 18 eases on February 13

Basic Factors in Allergy' will be the sub-ject presented on February 20 by Dr Matthew Walzer associate in medicine Cornell Univer

anty Medical College, and attending in allergy and chief of allergy clinic, Jewish Hospital, Brooklyn.

The last of the February series will be on February 27 by Dr Arthur M Rech clinical professor of obstetrics and gynecology New York University, College of Medicine. His topic will be "The Treat-

College of Medicine His topic will be "The Treatment of Obstetneal Bleeding"
Dr Samuel Kleinberg, of New York City, will discuss Back Pain on March 6 On March 13 Dr William Goldring, associate professor of medicine New York University College of Medicine, will lecture on 'Glomerulonephritis, and on March 20 'The Poptic Uleer Problem will be the topic of the lecture discussed by Dr Albert F R. Andresen professor of singlest medicine, using Listent College of fessor of clinical medicine, Long Island College of Medicine.

Blood Substitutes and Derivatives

DR. FREDERICK N MARTY will address members of the Wayne County Medical Socety on Tuesday February 11 at 6.30 r M. at the Hotel Wayne, Lyons. Dr Marty instructor in chinical medicine at the Syracuse University, College of Medi-cine, will discuss 'Use of Blood Substitutes and Derivatives.'

DIRECTORY OF CONVALESCENT HOMES

The Committee on Public Health Relations of The New York Academy of Medicine is preparing a The New York Academy of Medicane is preparing a new edition of the Directory of Conselectest Homes in the United States, to be published by the Sturgis Fund of the Winifred Masterson Burke Rehef Foundation of White Plains, New York The last issue of this Directory was published by the Sturgis Fund in 1931 under the auspices of the Committee or Convalencent Care of the American Conference on Hospital Service and has long been out of print The need of a new disease. The need of a new directory is recognised

Early in January, a questionnaire was distributed to all recognized convalescent homes maintained by municipalities, counties, or voluntary

bodies. The information sought dealt with the physical plant the staff, the requirements for admission the type of patients, therapy, and such other matters as would make the Directory a dependable guide for physicians who wish to refer their patients to institutions for convalescence The questionnaire was so devised that it could be filled out with a minimum of effort

Convalescent homes which have not received a questionnaire are urged to request one by writing to E. H. L. Corwin, Executive Secretary Committee on Public Health Relations, The New York Acad my of Medicine 2 East 103rd Street New York 29 New York

HAVE YOU ASKED YOURSELF THIS QUESTION?

Cole R. Gibson M D preadent of the Connecticut State Medical Society sake this question of the membership in the August State Journal If the Connecticut State Medical Society is not giving you the things you think it should, if it is not progressive according to your views if it is not meeting a profound need of the medical profession, what have

you done about it, or what do you intend to do beyou dome about it, or what do you intend to do be-sides paying your duest Your ideas and your entidesms for the improvement of the quality of service are needed—but they will be of little value if you remain silent. —News Letter Council on Medical Service, American Medical Association, November 25 1946

DEPARTMENT OF MEDICAL CARE INSURANCE

CONDUCTED BY GEORGE P FARRELL, DIRECTOR

Report on the Joint Meeting of the Subcommittee on Medical Expense Insurance of the Committee on Public Relations and Economics and Directors of New York State Medical Care Plans

A H AARON, M D, Buffalo, Chairman

A N INTERESTING and informative meeting of this group was held at Syracuse, New York, November 20, 1946 In addition to members of the November 20, 1946 In addition to members of the Committee and Directors of medical care plans, the Medical Society of the State of New York was represented by Dr William Hale, president, Dr Charles D Post, vice-president, Dr W P Anderton, secretary, Dr Carlton E Wertz, chairman of the Council Committee on Public Relations and Economics, Dr O W H Mitchell, chairman, Council Committee on Public Health and Education, and Dr Herbert H Bauckus, president, Veterans Medical Service Plan of New York, Inc Dr Frederick S Wetherell, president of Onondaga County Medical Society, Dr James K Quigley, president, Genesee Valley Medical Care, Inc, Dr Carlton P Kavle of the Niagara County Medical Society, Mr William C Gould, New York State Department of Insurance, and Mr George P Farrell, director, Bureau of Medical Care Insurance, also attended also attended

This Committee functions under the Council Committee on Public Relations and Economics and the Bureau of Medical Care Insurance, to aid medical care plans and to promote the coordination of physicians, and hospital and medical plans toward successful continuation of the voluntary prepaid

of the voluntary prepaid nonprofit insurance principle

Mr Farrell emphasized the importance of the standardized reporting form on financial and membership data of the plans, prepared by the Bureau of Medical Care Insurance

This form is to be filed

by each plan with the Bureau quarterly on a year to date basis, and from the information submitted trends of the plans can be noted

The Committee has been actively engaged in publicizing nonprofit medical care plans throughout the State

This work has been carried on through the medium of newspapers, county medical society bulletins, the New York State Journal of Medicals, and by informative talks The Woman's Auxiliary to the Medical Society of the State of New York has contributed extensively to the program by arranging for speakers to appear at their meetings throughout the State and at future meetings of county medical societies where no speaker has yet appeared

Attention was called to a booklet entitled "Check and Double Check on Sickness Insurance," written by J Weston Walch, instructor in economics and business law, Portland (Maine) High School and published by the Public Relations Bureau of the State Society for distribution throughout the This booklet is arranged in question and answer form and presents a comprehensive picture of the advantages of the voluntary principle over

that of compulsory health insurance

Five nonprofit prepaid voluntary medical care insurance plans are now in operation in New York State, located in New York City, Buffalo, Syracuse, Rochester, and Utica. An inhospital medical surgical plan for the Albany area has been approved by the State Insurance Department and Dr John E Heslin, chairman of the Albany County Medical Society's Committee on Economics, advised the group that enrollment of participating doctors was progressing rapidly and that contracts would be available by January, 1947

Chautauqua County Medical Society is now working on the development of a plan and has considered an inhospital medical-surgical contract.

considered an inhospital, medical-surgical contract (including obstetrics) on a service basis, and an inhospital medical-surgical plan on an indemnity basis Dr C Otto Lindbeck, chairman of the Committee on Economics of Chautauqua County Medical Society, reported that his Society hoped a definite plan would be decided upon at the meeting

of the Society in December
The New York State Department of Insurance is working in close cooperation with the nonprofit plans and Mr William C Gould, Department represents tive, reiterated the Department's desire to continue this close-working relationship and urged that efforts toward the successful operation of these plans be continued by physicians and directors of plans to prove that the voluntary nonprofit insurance system could and would succeed Mr Gould referred to a series of hearings which he had read on the Wagner Murray-Dingell Bill and recommended that these hearings be read by those present as they were "replete with valuable references" He commended the standardized financial and membership reporting form and advised the Committee that the State Insurance Department is now considering a requirement that all plans render to the Department a quarterly report, certified as to income and disbursements, assets and liabilities, changes in bank bal ances, and acquisition of securities

Mr Farrell described the background of Associated Medical Care Plans, Inc., formerly the Medical Service Plans Council of America, an or ganization of existing medical care plans throughout the United States The purpose of this new corporation is to seek mutual joint action, on a national carlo by all and all all and scale, by all voluntary prepaid medical care plans and to be closely coordinated with the activities of the Council on Medical Service of the A.M.A. Affiliation by New York State plans is being sought by this new corresponding the by this new organization, and in discussing the possibility of this affiliation the directors present expressed disfavor of membership in A.M.C.P. of plans approved by state medical societies and underwritten by commercial insurance companies.

Public reaction to voluntary medical and surgical plans and problems encountered in the administration of the control of the c tion of these plans were revealed in the paper presented by the directors of New York State plans. In order to bring this information to the profession

as a whole we are including the highlights in this

report.

Mr Carl Metzger, executive director of Western New York Medical Plan Buffalo stated that many problems were encountered in the administration of a medical-surgical plan because of dual corporate control with the hospital plan, the most difficult of solution being the public relations angle. Trouble starts when contract terms and benefits are not in keeping with local practice. He believes 'a merge of the hospital and medical plans into a single corporate structure would eliminate duplication of functions and procedures and avoid misconception of the plan's services and objectives.

He further stated that in order to assure an accurate, up-to-date financial picture of any plan subscribers must notify physicians of membership in the plan and physicians notify the plan of the existence of claims Failure on the part of subexistence of claims. Failure on the part of sub-scriber and physican to carry out these provisions causes discrepancies in records and upsets the true financial picture. To overcome this laxity many remedies have been applied. It is Mr. Mettger's belief, however that "the only solution is a serious recognition by both subscriber and physician to

overcome this problem."

The Western New York Plan has decreased the paper work required of physicians to a single claim service notice, and physicians who register com-plaints with patients relative to this phase of the plan bring about a sales resistance difficult to overcome.

Mr Metrger further believes that a broad educa tional program acquainting physicians with medical plans in general, including administrative and financial responsibility and publication of well-planned articles in medical journals throughout the state would help to accelerate doctor-plan public relations. He recommended that such a program be developed by the Public Relations and Medical Care Insurance bureaus of the State Medical

In conclusion, Mr Metager emphasized 'the importance of a thorough knowledge of medical economics on the part of physicians if the private practice of medicine is to continue rather than be revolutionized by a social uphenval.'

The importance of doctor participation in the success of a medical care plan was clearly outlined by Mr J Campbell Butler, executive director of Central New York Medical Plan Syracuse, who fit is a foregone conclusion that a medical care plan cannot hope for success without at least

85 per cent participation on the part of doctors underwriting a plan' A subscriber does not wish to be faced with the fact that his doctor is not a participating physician, nor does an employer care to investigate the matter in order to enroll a satisfied group This situation has been remedied by Central New York and public interest increased as doctor participation increased.

Mr Butler also stated that "the doctor should be familiar with and thoroughly understand the benefits to which his patient is entitled." He outlined two specific points for the doctor to follow to aid in the success of a medical care plan (1) enthusuastic representation of the plan to his patient, and (2) prompt submission of claim notices and bills for service in order that a true financial picture of the

plan is reflected.
The Genesee Valley Medical Flan, Rochester is the newest plan operating in the State Mr Sher the newest pian operating in the state Air some man Meech, managing director, informed the group that enrollment began July 15 1940, and membership had now reached 12,000 persons. Reception of the plan by employers and employees has been most favorable. This reaction is due in a large measure to the fact that doctors were signed as participating in the plan before contracts were sold assuring subscribers of the continued services of their own doctors under the plan

Mr Meech stated also that at present 85 per cent of all doctors in the five counties served by the plan are participating and in conclusion he reiterated are participating and in concurred no leavest and Mr the statements made by Mr Metzger and Mr Butler that 'the success of a plan depends upon an effective public relations policy and the whole-

hearted cooperation of participating physicians added to sound administrative practice. Reciprocity between New York State plans was cited as another means of establishing good public relations. This was the statement made by Mr H C Stephenson, managing director of Medical and Surgical Care, Utica. He expressed the opinion that this might be arranged by agreement and asked that further inquiries be made regarding such a possibility

In summary we reach the conclusion that a medical plan is only as strong as the administrative policies and the doctors make it, and we urge careful consideration of the facts presented in this report which seem to prove that the voluntary prepaid nonprofit medical and hospital insurance plans can maintain the foothold they have established and mcrease in strength to down any threat of a com pulsory program

UROLOGY AWARD

The American Urological Association offers an annual award not to exceed \$500 for an essay (or essays) on the result of some clinical or laboratory research in urology

Competition shall be limited to urologists who have been in such specific practice for not more than five years and to residents in urology in recog nized hospitals.

For full particulars write the secretary, Dr. Thomas D. Moore, 899 Madison Avenue, Memphia, Tennessee. Essays must be in his hands before May

1 1947 The selected essay (or essays) will appear on the program of the forthcoming meeting of the American Urological Association, to be held at the Hotel Statler Buffalo, New York, June 30-July 8, 1047

DEPARTMENT OF WORKMEN'S **COMPENSATION**

CONDUCTED BY DAVID | KALISKI, MD, DIRECTOR

Insurance for Domestic Workers

A CCORDING to a statement of Henry D Sayer, general manager of the Compensation Insurance Rating Board, the premium rates for workmen's compensation and employers' liability insurance for domestic workers employed in private residences, but not employed in clubs, religious, educational, charitable, or other institutions, on all policies with effective dates on or after July 1, 1946, are as fol-

	Per Capita Rate	Mınımum Premium	
Inservants	\$23 74	\$28 74	
Outservants	29 58	34 58	

(Outservants include those domestic workers whose duties are principally outside of the house, such as private chauffeurs, gardeners, groundkeepers, watchmen, stablemen, and handymen, other than those engaged on farms)

For occasional domestic workers, the rates are as

,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,	Per Capita Rate	Minimum Premium	
Inservants Occasional Outservants	\$11 87	\$16 87	
Occasional	14 79	19 79	

The rates for domestic workers are on a per capita basis and take no account of wages paid

Premium rates for workmen's compensation insurance in New York are for a term of one year from the inception date of the policy and are revised annually on the anniversary date of the policy, except where the policy is written for a shorter term than one year Rates are revised effective on July 1 of each year for policies issued or renewed during the year following

Coverage for domestic workers effective January 1, 1947, may be written on the Standard Workmen's Compensation and Employers' Liability Policy or may be written in conjunction with the Compre-hensive Personal Liability Policy or the Comprehensive Residence Policy with approved endorsements providing such coverage attached thereto

Attention is called to the following important rules and regulations, issued by the chairman of the Workmen's Compensation Board

Chapter 311, Laws of 1946, which became effective January 1, 1947, requires employers to carry workmen's compensation insurance for their domestic workers (Section 3, subdivision 1, group 12), whenever (1) the domestic worker is employed by the same employer for forty-eight hours or more per week, and (2) the employment is in a city or village of 40,000 or more population

The Board construes the term "domestic worker"

to mean persons employed to render services usual to a household, inside or outside, including, but without limitation, cooks, laundresses, cleaning women, maids, butlers, gardeners, handymen, and other "domestic" employees, whether employed in a private home, fraternity house, orphanage, resthome, home for the aged, or similar institutions. whether nonprofit, or operated for profit

Domestic workers on farms are specifically ex

Any employer who, on and after January 1, 1947, fails to secure workmen's compensation insurance for a covered domestic worker, will be personally liable for workmen's compensation benefits. The award of the Board is enforcible as a lien or judgment against such an employer In lieu of workmen's compensation benefits the injured domestic worker of a noninsured employer, who is required to obtain insurance, may elect to sue the employer in court for damages and, as in all cases of noninsured em-ployers, the employer is deprived of the common law defenses to such action Where the employer has insurance, workmen's compensation is the exclusive remedy of the employee

Noninsured employers of domestic workers under the new law are not subject to criminal penalties as

are noninsured industrial employers

According to the 1940 census, the following cities in the State have a population of 40,000 or more Albany, Bughamton, Buffalo, Elmira, Jamestown, Mount Vernon, New Rochelle, New York City, Niagara Falls, Poughkeepsie, Rochester, Schenectady, Syracuse, Troy, Utica, White Schenectady, Syra Plains, and Yonkers

The Board construes the 1940 census as prima facie evidence of population, but recognizes that other cities or villages may have grown since 1940 to 40,000 or more population, so as to come within the provisions of Section 3, subdivision 1, group 12, as amended by Chapter 311, Laws of 1946

When a domestic worker performs service outside a city or village of 40,000 or more population, or outside the State, the employer's obligation with respect to workmen's compensation will, nevertheless, continue if the principal employment is within a city or village of 40,000 or more population within the State

Domestic workers whose regular terms of emplov ment require forty-eight hours or more of work per week are not deprived of the benefits of workmen's compensation because in the particular week in which the accident occurs employment was less than

forty-eight hours On the other hand, an employee working for an employer forty-eight hours in a week may be entitled to the benefits of workmen's compensation if the accident occurs in that week, but will not necessarily be entitled to such benefits if the accident cident occurs in another week of fewer work hours where the regular hours of employment are less than forty-eight per week.

This new workmen's compensation coverage for domestic workers does not, of course, limit the prior provisions of the law, under which employers of four or more workmen or operatives are required to provide for the payment of workmen's compensation benefits to all their employees.

Wage rate is determined under Section 14, and

should give effect to board room, and/or other advantage regularly received in the employment. The effective date is January 1 1947 Benefits are payable for periods of disability caused by

accidents occurring on and after January 1, 1947, and for occupational disease disablements caused by an injurious exposure in employment on and after that date.

Increased Medical Allowances

THE following Resolution was adopted at the 83rd Annual Convention of the New York State Federation of Labor, and a copy sent to this office.

Resolution introduced by the Special Committee appointed by President Murray to confer with the County Medical Societies on questions of treatment of injured workers

Subject Legislative Proposal increasing medical

Workmen a Compensation Law

WHERZAS, The fees allowed to licensed physicians under the Workmen's Compensation Law have not been modified since they have been originally promulgated in 1933 as the Minimum Fee Schedule, and

WHEREAR Cognizance has been taken of the in creased cost of living in all fields of endeavor but consideration in this regard has not been given to physicians who have obligated themselves under the Workmen a Compensation Law to treat injured

WHEREAS Physicians in private practice command larger fees and are not burdened with the necessary secretarial expense required for the com-pletion of necessary reports in compliance with the

statute, now therefore be it

Resolved. That the 83rd Annual Convention of
the New York State Federation of Labor go on
record endorsing a legislative proposal which would have for its purpose the upward revision of medical allowances under this law

> (Signed) THOMAS J CURTIS EPHRAIM F SHAPIRO Committee on Workmen's Compensation

Dated August 20, 1946

CORRESPONDENCE

Priorities for Doctors Autos

Dr Edward Flood 910 Grand Concours New York 55, New York Dear Doctor Flood

The resolutions dealing with automobile priorities or physicians which you presented to the House of Delegates of the American Medical Association at the 8an Francisco Session were, as you know, agreed to in principle by the House of Delegates. In addition the House referred this matter to the Committee on Postwar Medical Service

Representations have been made repeatedly to responsible agencies in Washington urging that ply sickas particularly veteran physicians, be given high prority to obtain necessary automobiles. At its recent meeting, the Committee on Postwar Medical Service discussed the question and it was developed that the automobile manufacturers have been cooperating to a considerable extent through local dealers. Members of the Committee expressed the opinion that the manufacturers themselves are dong all they possibly can. Such remediable delays as are occurring at the present time seem to be on the dealer level The Committee will continue to exert such pressures as it can. Incidentally the name of the Committee on Postwar Medical Service has been changed to Joint Committee for the Coordination of Medical Activities.

> Very sincerely yours, (Signed) ERNEST E. IRONS, M.D., Chairman, Joint Committee for the Coordination of Medical Activities

Fees for Life Extension Examinations

To the Editor

At the November 1946, meeting of the Lockport Academy of Medicine it was decided that no member of the Academy should do Lafe Extension Examina tions for a fee of \$2.50.

This fee was considered lower than the fee charged for similar examinations in the community

Very truly yours J Lirson, M.D., Secretary

Lockport City Hospital Lockport, New York December 10, 1946

MEDICAL NEWS

Cancer Committee Grants Funds to Educate Doctors and Nurses

OPENING a new phase in the attack on cancer, the New York City Committee of the American Cancer Society on January 6 made its first large grant for better cancer training of medical students,

doctors, and nurses by giving \$253,100 to Memorial Hospital, New York City
Gen. John Reed Kilpatrick, chairman of the Committee's board of managers, in presenting a check for that amount to Mr Regnald G Coombe, president of the hospital, stressed the need for more widespread medical education in the field of cancer

One of the purposes of the grant is to enable Memorial Hospital to work out with Cornell University Medical College and New York University, College of Medicine, as thorough a program of cancer training for medical students as can be found anywhere in the world Under this grant, Memorial Hospital will be able to expand greatly the use of its

extensive facilities for teaching cancer technics.
The New York City Committee grant also provides \$24,000 for ten fellowships at the Strang Cancer Prevention Clinic of the Memorial Hospital to interest qualified young physicians in cancer detec-tion as a specialty, with an additional \$5,000 for training physicians to work in cancer detection and prevention clinics

For clinical investigation, research, and expansion of cancer facilities at Memorial, the Committee

also made the following grants

For clinical investigation of gastric cancer \$10,000 for investigation of the Papanicolaou smear \$5,000 for steroid hormone research \$10,000, for chemical compound testing \$10,000, for compound or anti-biotic testing \$1,100, for expansion of clinical facil-ties \$20,000, and for support of the hospital's sta tistical department \$15,000

Grants Available for Diabetes Research

THE New York Diabetes Association has funds The New 10rk Diagons lands with which to aid to be issued on an annual basis with which to aid research in clinical and experimental diabetes

An invitation to apply is extended to medical graduates as well as to workers in allied fields

An application for a grant should contain a description of the project and the name of the laboratory or individual under whose guidance the work will be done, and should have the approval of the head of the department in which the work is to be done

Applications should be filed on or before Febru ary 15, 1947, with Dr Edward Tolstoi, chairman Committee on Research, New York Diabetes Asso ciation, Inc., 2 East 103rd Street, New York 29

V D Specialists Lecture in New Seminars

THE 1947 winter-spring series of lectures for practicing physicians on diagnosis and treatment of venereal diseases started at the New York City Department of Health on January 11 Meetings are HE 1947 winter-spring series of lectures for pracheld at the Health Department building, 125 Worth Street, Manhattan, every Saturday morning at 10 30 a m. through April 26 Experts in fields of venereal disease control are participating in the seminar

No registration or fee for the course is required Sessions are informal, with question periods following each lecture Physicians who attend may be reached by their offices at Worth 2-6900, extension

The schedule for the remaining lectures is as follows

Practical Management of Gonor-February 1 rhea Health Department Experiences Dr Adolph Jacoby, medical supervisor of clinic, City Department of Health, associate professor of gyne-cology, Post-Graduate Medical School of Columbia University

February 8 Minor Venereal Diseases Dr Borns Kornblith, associate surgeon, Gouverneur Hospital, physician-in-charge, Lymphogranuloma Venereum Clinic, Department of Health

February 15 Syphilis in Pregnancy Dr Mortimer Speiser, assistant professor of obstetrics and gynecology, New York University

March 1 Congenital Syphilis Dr Dabney Moon-Adams, assistant professor of dermatology and syphilology, College of Physicians and Surgeons, Columbia University, assistant dermatologist anderbilt Clinic

Syphilis of the Bones Dr Joseph March 15 Buchman, assistant professor of orthopedic sur-gery, New York University, College of Medicine, as sociate attending orthopedic surgeon, Hospital fo Joint Diseases

March 22 Cardiovascular Syphilis Dr Samue S Paley, cardiologist, Bronx and Harlem hospitals March 29 Reactions Occurring in the Therapy o Venereal Diseases. Dr Nathan Sobel, assistant pro fessor of dermatology and syphilology, New Yorl University, College of Medicine, attending derma tologist, Bellevue Hospital

April 5 Differential Diagnosis of Early Syphilis Dr Frank C Combes, professor of dermatology and syphilology, New York University, College of Medi

cine, attending dermatologist, Bellevue Hospital.
April 12 Nonvenereal Diseases of the Gentalis Dr Martin V Boardman, associate dermatologis and syphilologist, Lincoln Hospital, assistant dermatologist, Capaci Unit matologist and syphilologist, Skin and Cancer Unit Post-Graduate Hospital

April 19 Importance of Serology in Veneres Disease, Dr Charles Rein, special consultant I serology to War Department, in charge of Sero-logic Laboratory, Start and Consultant Rest Gradu logic Laboratory, Skin and Cancer Unit, Post-Gradu ate Hospital

April 26 Penicillin Therapy of Venereal Disease Dr William Leifer, assistant professor of dermatol ogy and syphilology, New York University, Colleg of Medicine, special consultant to War Departmen on venereal disease

Health Council of Greater New York

REATION of the Health Council of Greater CREATION of the International Community of 29 of New York with an initial membership of 29 of ficial and voluntary health agencies of the City was announced on January 6 by Dr L Ogden Woodruff president of the Council.

At the same time Dr Woodruff announced that

the Health Commissioner Dr Israel Weinstein Dr Edward M Bernecker Commissioner of Hospi tals and Edwin A. Salmon, Chairman of the Hospital Council, had become members of the Board of Directors. All have assured the Health Council of their personal cooperation Dr Woodruff said.

Conference on Medical Service

THE 20th annual meeting of the National Conference on Medical Service will be held Sunday February 9, 1947, at the Palmer House Chicago

The program is as follows

llincia. The program is as 10100vs 9 30—Call to order and address of the president, Dr Cleon A. Nafe, of Indanapolis 9.50—The Eighteth Congress, Dr Joseph S Lawrence, Washington, D C 10 10—The Operation of Public Law 725 The National Hospital Construction Act Herman E. Hilleboo, United States Public Health Service, Washington D C 10 40—Discussion

period, 11 00—Veterans Care Where Do We Go From Hero? Paul B Magnuson, Veterans Adminis-tration, Washington, D.C., 11 30—Medical Co-operatives, L. B. Kleinschmidt, Chicago, and 11 50—Developments in the Council on Medical Service Thomas A. Hendricks, Chicago, After lunchoon there will be an open forum on modern in-fluences in medical practice, undergradusts available. fluences in medical practice undergraduate medical education, trends toward specialization, general practitioners in hospitals and hospital staff organi ration.

Dr Irving S. Wright, of the New York Hospital.

is the recipient of a research grant recently made by Sharp & Dohme, Inc., Philadelphia. The grant to Dr Wnght will partially support an extensive research program he has initiated in his study of pempheral vascular diseases. Dr Wright will give special emphasis to those problems dealing directly with thrombosis in all its manifestations which will include the development of new anticoagulants.

Dr Louis F Bishop Jr., of New York City has been named one of the New York City honorary police surgeons by Mayor William O'Dwyer

Morns Brooks, M.D., who was released from the U.S. Navy, with the rank of captain, Medical Corps, after six years of service, has been recalled to active duty He is now the medical representative to the Commandant (District Director of Naval Reserve) at third Naval District Headquarters, 90 Church Street, New York City

Dr Abraham Vinograd, of Brooklyn, recently re-turned from service with the U.S. Army Medical Corps overseas, has opened an office for general practice in the previous location of Dr. John T. Jenkin on Lake Boulevard

Dr. Vinograd is a graduate of the University of Basle Switzerland, Medical School. Between the years 1939 to 1944 be trained in hospitals in New John Company of the Co

York City as well as in the states of Texas and Ten

While in Chattanooga he was head resident physician in pediatrics at the Children's Hospital.*

Dr George T Pack, attending surgeon to the Memorial Hospital for Cancer and Allied Diseases, addressed the Fort Steuben Academy of Medicine at Steubenville, Ohio, on December 10, 1946, on the subject of "The Management of Tumors of the Lower Extremity"

Edward C Reifenstein, Jr, MD, formerly Harvard Medical School research fellow at the Massachusetts General Hospital, Boston, has been appointed research consultant to the Sloan-Kettering Institute for Cancer Research at the Memorial Hospital Cancer Center, New York City He has also been named as clinical research consultant to Ayerst, McKenna & Harrison, Ltd, New York City At Boston, Dr Reifenstein assisted Dr Fuller Albright in investigations on endocrine and metabolic disorders, at the Sloan-Kettering Institute, he will carry on chinical research on the relation of glandular disturbances to a second of the second of th lar disturbances to cancer He will continue as secretary and editor of the Transactions of the Conferences on the Metabolic Aspects of Convalescence, which are being held two or three times a year under the auspices of the Josiah Macy, Jr, Foundation.

Dr Roger C Bliss, of Albany, who has completed a residency in obstetrics at Memorial Hospital, Syracuse, has resumed private practice in Hudson Dr Bliss served three years with the armed forces, including eleven months in the Pacific with the Airborne Division.*

Dr Ralph Dwork and Dr Sidney H. Dressler, of Brooklyn, have been appointed resident physicans at the National Jewish Hospital in Denver, Colorado

The two doctors will train physicians in veterans' hospitals throughout the southwest territory in advanced technics of tuberculosis treatment

Dr Harry Levitt, of Brooklyn, has resumed his practice of dermatology and allergy at his office following his honorable-discharge from the Army Medical Corps as a major after forty four months' serv-Dr Levitt has been elected a member of the American Academy of Allergy *

Dr Francis L Cooper, of East Hampton, was a major in the U.S. Army during the war and served in the southwest Pacific area for two years Following his release from active service in March, 1946, he served as resident physician for a short time at the Southampton Hospital.

Dr Cooper has established his practice in East Hampton in association with Drs Paul F Nugent and Edwin H. Heller, as a member of the East Hampton Medical Group *

Dr Joseph Thompson, of Gloversville, who re-

ceived his discharge from the US Army with the

rank of captain, last April, has resumed his practice.
Dr Thompson has been taking a postgraduate course at Cornell since his release from service. He served three and one-half years, most of the time in the ETO *

Dr Samuel L Pettit, formerly of New York City and more recently of Albany, will henceforth be associated with Dr Sidney Mitchell in the practice of medicine in Plattsburg

Dr Pettit, a graduate of Albany Medical College. has for the past three and one-half years been specializing in diseases of infants and children *

Dr Hugh McGee, of Jeffersonville, has been awarded a \$500 Lions Club scholarship for advanced study of eye diseases at New York University, Col lege of Medicine

Dr McGee, who holds his AB degree from Columbia University and his MD from Long Island College of Medicine, joined the Army Medical Corps in 1942 and was commissioned a captain. He served overseas in England and on the continent with the 312th Combat Engineers receiving the Bronze Star for heroic action in combat.

Dr William E MacDuffie, of Olean, returned from the armed forces, has opened offices in 114

North First Street for practice of general medicine.
Dr MacDuffie is a graduate of the medical school
of the University of Buffalo, 1942 He served two years in the Buffalo City Hospital and then entered the Army Medical Corps He served as a captain in the European Theater two years.*

Alton A. Germain, M D, of Depew, has opened an office for the practice of general medicine in Attics.*

Dr William Magenheimer, of New York City, has opened his office in Waterloo

Dr Magenheimer is a graduate of the University of Buffalo, School of Medicine, and interned in the Polyclinic Hospital at Harrisburg, Pennsylvania. He served with the Navy during the war, being attached to the Medical Corps with the Marines in the Pageific area. the Pacific area. Since his release from the service he has taken postgraduate work in the Polyclinic Hospital in New York City *

Dr Louis Diana resumed his practice of medicine on December 5 He was recently discharged from the United States Army after three years in the service, part of which time was spent in the Pacific theater of operations. He attended the University of New York and is a graduate of the New York Medical School.*

Dr E Prince Danforth, of Bainbridge, has been awarded a \$500 Lions Club scholarship for advanced study of eye disease at New York University, College of Medicine Dr Danforth served four years in

^{*} Asterik indicates that the item is from a local newspaper

the U.S. Army Medical Corps, having the rank of major when he received his discharge.

Dr Mary C Jaquette, of Schenectady, recently completed a postgraduate course in motor anomalies of the eye at Mt. Sinai Hospital, New York City

Dr H. Benjamin, of Andes who has practiced medicine in Andes for soveral months, has accepted a position in a hospital in Michigan. Dr Benjamin s departure will leave Andes without a resident physiclan.*

Major H. Robert Blank, of White Plains, who plans to practice adult and child psychiatry in White Plains, has begun his terminal leave from the Army Modical Corps after more than three years service most of which was spent at Mason General Hospital, Brentwood the Army's only hospital devoted exclusively to the care and treatment of neuropsychiatric casualties.*

Dr John A. Degen, Jr., of Albany, a veteran of more than four years overseas service in World War Two, has been named to succeed Dr Harry L. Chant as State health officer for the Orange-Rock-

Chant as State nearth officer for the Configuration and Sullivan district, it was announced recently
In August, 1942 Dr Degen was commissioned
as a captain in the U.S Army Medical Corps and
was assigned to the Gongral Medical Laboratory at Salisbury He was finally attached to the British Second Army with which he landed on the Normandy Beachhead on D plus Four, June 10 1944.

During 1944 and part of 1945, Dr. Degen worked with the British forces in France, Belgium, and Hol land on public health assignments and was eventually transferred to the American Military Government project as a medical officer in 1945 He served as public health officer for three-month periods in Bremen and Munich and was redeployed in November of 1945 *

Dr Edward λ. Mikel, of Delmar reentgenologist. has received a War Department certificate of appreciation for patriotic service.*

County News

Albany County

Cerebral palsy is as common as polic, but not so widely publicized, declared Dr Meyer Perlstein, of Chicago, on December 16 when he spoke at the twoday clinic at Albany Hospital, sponsored by the National Society for Crippled Children and Adults, and the Cerebral Palsy association of the Albany

More than two thirds of children stricken with cerebral palsy can be re-educated, and are normal mentally Dr Perlstein declared. He said that estimates place the incidence of the ailment at 7 cases per 100 000 population.

Dr Homer L. Nelms has been named president of In comer L. Neims has been named president of the Albany County Medical Society Dr John J Clemmar is vice-president. Dr Albert Vander Veer II is secretary, Dr Frances E. Vosburg treasurer and Dr Emerson C Kelly, historian. Dr John C McClintoch heads the public relations committee.

Bronx County

The December meeting of the Bronx Dermatological Society was devoted to a symposium on the action of antihistamine drugs. The symposium contion of antihistamine drugs. The symposium side of the following lectures: "Pharmacology and Chemistry of Benadry," by Dr G Rievesch, Jr, "Experimental Studies of Pyribensamine as an Antialterjae Aid, by Dr Rudolph L. Mayer Pharmacologic and Clinical Experience with Benadry," by Dr Thomas H. McGarack Antihistamine Drugs in Allergic Conditions, by Dr Benadtyl," by Dr Indinas II. Dr John H. Hollis was elected president of the Chenango County Medical Society at the annual meeting of members held December 10. succeeds Dr. William Mayhew of Oxford. Dr Hollis

Other officers named at the business session include Dr Newton Brachin, of Greene, vice-president and Dr John H. Stewart, secretary treasurer Dr A. H. Evans, of Guillord, was elected to the board of censors for a three-year term and Dr J Mott Crumb, of South Otselic, was elected as dele-

gate to the State association.

Members of the medical society were guests of the Rotary Club at their luncheon meeting recently, and at the Society's meeting later were addressed by Dr Marjorie Murray, of Cooperstown.*

Delaware County

Dr Elhott Danforth, of Sidney, was elected president of Delaware County Medical Society at a din-

ner meeting of the group on December 10
Other officers for 1947 include Dr Jerome Kogan, Hobart, vice-president, and Dr F R. Bates, Walton, elected secretary-treasurer for the fourth year A new office was created, that of historian, to which Dr Orin Q Flint, Delhi, was named.*

Dutchess County

Members of the Dutchess County Medical society held their December meeting at the pavilion of the Hudson River State Hospital on December 12

Drs Clay Ray Murray, Sawnie Gaston, and Barbara Stimson, of Columbia Presbyterian Medi-cal Center, discussed "Fracture Problems"*

Erie County

Dr Arthur F Glaeser and Dr E Dean Babbage were elected president and vice-president, respec-

others elected president and vice-president, respectively, at the annual election meeting of the Society Others elected were Dr Roy L Scott, second vice-president, Dr Helen G Walker, secretary, and Dr Everett A. Woodworth, treasurer Committee chairmen are Dr Werner J Rose, legislation, Dr Elmer T McGroder, public health, Dr John C Brady, economics, Dr John Burke, membership, and Dr Joseph C O'Gorman, workmen's compensation. tıon

The newly elected president, Dr Glaeser, presented a silver tray to Dr Louise W Beamis who retired as secretary after eighteen years of continu-

ous service in that position

The following were also elected

Board of censors, Dr Eugene M Sullivan, Dr Charles W Bethune, Dr Frank J Montrose, Dr Arthur D Hennessy, Dr Walter D Westinghouse Delegates to State Society, Dr Porter A Steele, Dr John D Naples, Dr J Frederick Panton, Dr Lohn T Donoven, alternate delegates Dr Harbert

John T Donovan, alternate delegates, Dr Herbert E Wells, Dr Brady, Dr Leon J Leahy, Dr Norman C Bender

Nominating committee, Dr Harvey P Hoffman, Dr John A. Post, Dr Henry N Kenwell, Dr Alfred H Noehren, Dr Edmund A Mackey, Dr Thomas J O'Brien, Dr Earl L Eaton.*

Fulton County

Dr Francis S Hyland, of Gloversville, was elected president of the Fulton County Medical Society at the annual meeting held on December 18

Other officers elected were Dr M McMartin, Johnstown, vice-president, Dr Robert Lenz, Gloversville, secretary, Dr William Raymond, Johnstown, treasurer, Dr A. Goodwin, Dr J S Clemans and Dr Frederick Crump, Gloversville, board of censors, Dr S C Clemans, Gloversville, delegate, and Dr J F Sarno, Johnstown, alternate delegate *

Directors of the Fulton County Tuberculosis and Public Health Society met December 12 in the

Gloversville Library and accepted the resignation of Dr J Edward Grant, of Northville, who has served for nearly twenty-seven years Dr Grant has been for nearly twenty-seven years Dr Grant has been made honorary life president of the organization It was explained that Dr Grant yielded his duties because he felt that a younger member of the society should take over the task. No successor has been named

Jefferson County

Dr Merton C Hatch, associate professor of clinical obstetrics, Syracuse University, College of Medicine, spoke to the Jefferson County Medical Society on "Prenatal and Postpartum Care," on January 9

Kings County

The Medical Society of the County of Kings and Academy of Medicine of Brooklyn will be one hundred and twenty-five years old during the year 1947

The Society was organized in 1822 at a meeting in the home and office of Dr Adrian Vanderveer, in It met later at a tavern kept by William Stephenson, on Fulton Street, called "Auld Lang Syne," and for five years the quarterly meetings were held in alternation at that place and at the Van Buren Inn kept by Simon Voris on what is now Flatbush Avenue

For more than seventy years it developed with the city, increasing its membership, increasing its library until in 1894, under the leadership of Dr George MacNaughton, a movement to raise funds for a new building was initiated and through the efforts of many members of the Society, funds were obtained and a suitable site was found at 1313 Bedford Avenue, Brooklyn

The total cost of the site and the building was The dedication of the completed building

took place in 1900

The Medical Society of the County of Kings is the oldest scientific organization in Brooklyn, having celebrated its centenary in 1922

The Library was established in 1844 It was proposed by Dr Bradlev Parker and planned by Dr Thorne It is the only public medical library on Long Island

Only two cities of the country (Philadelphia and Baltimore) have older public medical libraries

It had and has the first fire-proof (steel) stacks of any medical library in this country, if not in the It was the needs of the Library that forced and secured the construction of the present medical building on Bedford Avenue In size it ranks as the fourth in the country after that of the Surgeon General's office

The Society began the celebration of its one hundred and twenty-fifth anniversary at a dinner given in honor of Dr Thurman B Givan, president during the year 1946 The dinner was held in the Grand Ballroom of the Hotel St George, Brooklyn, N Y, on January 29 At this dinner Dr Givan was presented with a medal and scroll which is given to all

retiring presidents of the Medical Society
Dr Morris Fishbein, editor of the Journal of the American Medical Association spoke at the dinner as well as other prominent medical and civic leaders

County air may help but the best treatment for tuberculosis is rest, flat in bed, according to Dr William Dock, of Brooklyn.

Dr Dock on December 7 told the annual meeting of the Radiological Society of North America that "absolute recumbency ' not in a propped-up or sitting position, was the most important factor in con trolling the disease

Monroe County

In commemoration of the one-hundredth anniversary of the discovery of chloroform, the Obstetn cal Section of the Rochester Academy of Medicine held a meeting on January 22. The address was given by Dr Benjamin P Watson of New York City, on "The Life and Works of Sir James 1 Simpson."

Montgomery County

The annual meeting of the Medical Society of the County of Montgomery was held on December 10 with officers for the coming year elected and two resolutions adopted one condemning the Board of Supervisors for abandoning the Montgomery Sana torium without consultation with the Society the other to increase the fees of physicians in the City and County The increase will be duly advertised.

County The increase will be duly advertised.
Dr R. H. Juchli was elected president for 1947 to
succed Dr M. T Geruse who has served during the
present year Others elected were Dr Raymond
M. Wytrwal, St. Johnsville vice-president Dr
David D Childs, secretary and Dr Leonard M.

McGuigan, treasurer
Those chosen to serve on the Board of Censors were Dr Geruso Dr E A Bogdan, and Dr D H

Staffenhagen, Canajoharie.
Dr P J Fitzgibbons and Dr A J Townley.
Fonda, were elected as delegates to the State Medical
Society and Dr William R. Rathbun Canajohane delegate to the Fourth District Branch

The resolution concerning the sanatorium follows "Be it resolved that the Medical Society of the County of Montgomery go on record as condemning the action of the Board of Supervisors in closing the Montgomery Sanatorium without prior and proper consultation with the County Medical Society

New York County

At the Stated Meeting of the New York Academy of Medicine held December 5, Dr George Bachr who has served as president of the Academy since January 8 1946 was re-elected president for a term

January 3 1946 was re-elected president for a term of two years.

In addition, the following officers were elected vice-president, Dr Waldo B Farnum, trustees, Dr Bradley L. Coley and Dr Seth M Milliken mem bers of the Committee on Liorary Dr Arnold Knapp Dr Robert L. Levy and Dr Morris K. Smith Members of the Committee on Admission, Dr Ralph Colp Dr Dabney Moon Adams, Dr Ralph L. Barrett, Dr Frederick C Hunt, and Dr Charles G Wilhamson, one member of the Committee on Admission to fill the unexpired term of Dr Arthur C DeGraff Arthur C DeGraff

The Board of Directors of the Eye-Bank for Sight Restoration, Inc. following its most recent meeting, announced the following scholarship and fellowship

awards and appointments
Dr Herbert M. Katzın, of New York, has been
put in charge of the Laboratory for ophthalmic research of the Eyo-Bank for Sight Restoration, Inc. Dr Frank Constantine has been granted a fellow ship to pursue studies in relation to corneal vasculari zation Dr Arnold Forest, of the Army Institute of

Pathology Washington, D C has been granted a fellowship for training in ophthalmic pathology with special emphasis on corneal pathology, and Dr Milo H. Fritz, of New York, has been granted a fellowship to continue studies in vitreous replacement and vitreous transplants.

Niagara County

Dr John C Kinzly North Tonawanda, elected president of the Niagara County Medical Society for 1947 at the recent annual meeting

Other officers elected were Dr William W Other officers clotted were Dr William W Pierce Lockport, president-elect for 1948 Dr Joseph D Erneo, Niagara Falls, vice-president, Dr Charles M Dake, Niagara Falls, secretary, and Dr Dudley B Fitz-Gerald, Lockport, treasuror Dr William A. Peart, Sanborn and Dr Guy S Philbrick, Niagara Falls, were named delegates to the State Medical Society and the following chair-

men of committees were elected

men of communes were enough to the first of the Dr Fitz-Gerald, board of censors Dr E. M G Ruegor Niagara Falls legislative commuttee, Dr Josoph C Elia, Niagara Falls public health and medical education, Dr Wilfred M Anna, Lockport, economics and public relations Dr Forrest W Barry Lockport, workmen s compensation and Dr Julius T Markowits, North Tonawanda, member ship committee

Dr Charles M Brent is the retiring president and he has served the Society for the last four and a half years, including three and a half years as secretary *

Onondaga County

Dr J Ernest Delmonico was elected president of the Syracuse Academy of Medicine at the annual meeting held December 17 in the University Club

Other new officers for the coming year are Dr A C Silverman, vice-president Dr Ferdinand J Schoeneck, secretary Dr William E. Pelow, treasurer

Council members are Dr Merton C Hatch Dr Max Newer, and Dr W Walter Street. Dr James G Derr was appointed a trustee for a three-year term.

During the scientific session which proceded the business meeting an address on "Protruded Inter-vertebral Disks" was given by Dr. Arthur D. Ecker followed by an address by Dr. O. D. Chapman on Immunization for Influenza."

Ontario County

Dr B C Hurlbutt, of Rushville, past-president of Ontario County Medical Society has been appointed director of Ontario County's School Hygiene District.

Dr Huributt succeeds Dr James F Maltman of Canandalgua, recently reagned who was ap-pointed director in August, 1939 *

Orange County

The largest annual meeting of the Orange County Medical Society in recent years was held December 10 when 84 members convened at the Palatine Hotel

Elected president, replacing Dr Ralph Waldo Thompson, was Dr W J Hicks, of Middletown. Dr E. B Reed, of Newburgh and Dr E. C Water bury also of Newburgh, were elected vice-prosident and secretary treasurer respectively

Dr E. J Burke, director of surgery at the Jersey

City Medical Center, described new advances in gallbladder surgery

It was announced at the 140th annual meeting that 74 members had served in either World War I

Dr Charles McWilliams, of Newburgh, Dr Alec Preston, of Middletown, Dr E R. Van Amberg, of Pine Bush, and Nathaniel Keyes, of Goshen, were named to the Board of Censors

Dr T R. Proper, of Newburgh, was chosen delegate to the State Society Delegates elected to the First District Branch were Drs Cameron May, of

Cornwall, and Harry Hoffman, of Monroe

Dr Harry L Chant, of Middletown, recently was appointed associate professor in the Department of Public Health Administration of the Johns Hopkins University School of Hygiene and Public Health *

Richmond County

or II

Dr Dean A. Clark, medical director of the Health Insurance Plan of Greater New York, discussed the need for the adoption of the Health Insurance Plan on December 5 at an open meeting sponsored by the Staten Island Council of Social Agencies in the Staten Island Day School. St George

Staten Island Council of Social Agencies in the Staten Island Day School, St George
Dr Milton S Lloyd, chairman of the health insurance plan of the Richmond County Medical Society, "speaking as an individual," analyzed the difficulties to be faced in trying to set up a group insurance plan. Approximately 175 persons at-

tended the session

Rockland County

Dr Leon Goldensen, psychiatrist at the war trials at Nurenberg, Germany, was the principal speaker at the annual meeting of the Rockland County Medical Society held December 5 at the Villa Lafayette in Spring Valley, at which time election of new officers and the admittance of a number of doctors to the medical society also took place

A brief address was made by Dr Frank J Schwartz, of Spring Valley, retiring president of the Society A report of the new work of the commission was then given by the secretary, Dr Robert L

Yeager

The election of officers of the society for 1947 was then held and Dr E Hall Kline, of Nyack, was named president, Dr George Stone, of Suffern, vice-president, Dr Marjone R Hopper, of Nyack, treasurer, and Dr Robert L Yeager, of the Summit Park Sanatorium, Pomona, was elected secretary

Six doctors were assigned to committees of the Society They were Dr Harold Heller to the legislative committee, Dr Abraham Schechner, of Nyack, to the membership committee, Dr Frederick Schroeder, of Pearl River, to the public health committee, Dr Alfred Moscarella, of Spring Valley, to the medical economics committee, Dr Royal Sengstacken, of Suffern, to the workmen's compensation committee, and Dr Emanuel Freund, of Haverstraw, as one member of the committee of censors

Dr Armand E Scala, of Suffern, was named as delegate to the State Medical Society with Dr John C Petrone, also of Suffern, to act as alternate *

Rensselaer County

Dr Francis J Fagan, of Troy, was elected president of the Society December 10 at the business portion of the annual meeting at the Troy Club He succeeds Dr Ranald E Mussey

Dr Clement J Handron was elected to the office of vice-president, Dr Henry F Albrecht, Jr, became secretary and Dr Henry Epstein, treasurer Drs Crawford R. Green and Leo S Weinstein are members of the board of censors, and delegates to the annual meeting of the State Medical Society are Drs Stephen H Curtis and Richard P Doody Alternates selected were Dr Handron and Dr Robert E DeFriest *

St Lawrence County

Dr George E Anderson, clinical professor of medicine at the Long Island College of Medicine, Brooklyn, addressed the St Lawrence County Medical Society at a meeting held at the Potsdam Club, Potsdam, on December 12 Dr Anderson's subject was on diabetes mellitus—its modern interpretation and treatment

This postgraduate instruction was presented as a joint endeavor by the Medical Society of the State of New York and the New York State Department

of Health

Schenectady County

Dr Harry E Reynolds was elected president of the Schenectady County Medical Society at the annual meeting on December 5 He succeeds Dr William E Gazeley

Others elected to offices for the coming year are Dr Nelson Rust, vice-president, Dr Harry Miller, treasurer, and Dr R E Isabella, secretary

Dr Reynolds has been vice-president of the Society for the past year, and Dr Rust has been secretary

Four local doctors who are celebrating their fiftieth year of medical practice were honored at the affair They are Drs Walter M Clark, Jesse M W Scott, Walter D Spoor, and Edward J Wiencke *

Tioga County

Dr J Sutton Regan, assistant professor of surgery at the University of Buffalo, School of Medicine, addressed the Troga County Medical Society at a meeting held on December 10 Dr Regan's subject was "Criteria for the Surgical Treatment of Essential Hypertension"

This postgruaduate instruction was arranged by the Medical Society of the State of New York with the cooperation of the New York State Department

of Health.

Wyoming County

The following officers were installed at a meeting of the County Society on January 8 president, Dr W J Chapin, of Perry, vice-president, Dr O T Ghent, of Warsaw, secretary-treasurer, Dr P A. Burgeson, of Warsaw, delegate, Dr G S Baker, of Castile, and alternate, Dr H. S Martin, of Warsaw

Members of the board of censors are Drs. M T Greene, of Castile, L H Humphrey, of Silver Springs, and G A. McQuilkin, of Varysburg The legislative committee consists of Drs. Ghent, Baker,

and G W Naırn, of Warsaw

Following a custom established almost sixty years ago the winter meeting, at which time these officers took office, was held at the Castile Sanitamin at the invitation of Dr. Mary T. Greene

After the business meeting the Society was addressed by Dr L L Klostermyer, of Warsaw, whose subject was "The Role of X-Ray in the Diagnosis of Acute Abdominal Emergencies"

NECROLOGY

Irving C Allen, M.D., of Brooklyn, died on December 3. He was 74 years old. In 1895 he was graduated from New York University, College of Medicine For a number of years he was associated with his father, the late Dr Cyrus Springs Dr Allen was a member of the Kings County Medical Society, the American Medical Association, and the Medical Society of the State of New York.

George E Beatty, M.D., 58, of Brooklyn, died on December 16 He received his medical degree in 1912 from the Long Island College of Medicine Dr Beatty had long been on the staff of the Norwegian, Caledonian, and Prospect Heights hospitals He was also a former instructor in pediatrics at the

Post-Graduate Hospital, Manhattan

Leon J Barber, M D, 58, of Patchogue, Long Island, died on December 23 He was a member of the staff of the Mather Memorial Hospital, Port Jefferson, Long Island, and the State and County medical societies In 1913 he was graduated from the University of Vermont Medical School Dr Barber was also a member of the Associated Physicians of Patchogue and the American Medical Association.

Sherman M Burns, M D, 53, of Oswego, died on December 15 He received his medical degree in 1920 from Syracuse University, College of Medicine, and was a member of the American College of Surgeons, Syracuse Academy of Medicine, the State and County medical societies, American Medical Association, and the Academy of Medicine Dr Burns was president of the Fifth District Branch of the State Medical Society

George Andrew Chapman, M D, 75, of Glens Falls, died on December 16 For forty years he had been health officer of the town of Queensbury For twenty-five years he was attending physician at Glens Falls Hospital, later serving on its con-

sulting staff

Dr Chapman was a former president of the Warren County Medical Society, a member of the American Medical Association, and the State and County medical societies In 1897 he received his medical degree from the Baltimore Medical College Dr Chapman was also a member of the American Public Health Association, American Association for the Advancement of Science, American Congress of Internal Medicine, New York State Society of Internal Medicine, Sanitary Officers' Association of the State of New York, and the

American Therapeutic Society
S Walton Day, M D, 71, of Auburn, died on
December 14 He was graduated from Syracuse
University, College of Medicine, in 1905 Dr Day was a member of the Cayuga Medical Society, on the staff of the Mercy Hospital, Auburn, and maintained a private hospital at his home in Auburn

Beaman Douglass, M D, 80, of New York City, died on December 6 He was the inventor of the Douglass tonsillitome and other medical instruments

used for nose, throat, and ear surgery
Dr Douglass was a member of the American
Medical Association the Laryngological, Rhinological and Otological Society, and the State and County medical societies He was graduated from Columbia University, College of Physicians and Surgeons, in 1886

Dr Douglass was a former member of the New York Academy of Medicine and a former consulting surgeon at Post-Graduate Hospital in New York City

Ambrose W Gallagher, M D, of Hamlet, North Carolina and formerly of Scarsdale, died on December 24 at the age of 51 He was graduated from Fordham Medical College in 1920 Dr Gallagher was a member of the American Medical Association. and the State and County medical societies

Robert Gewanter, M.D., of Long Island City, died on November 3. He was a member of the American Medical Association, the State and County medical societies, and the American Academy of Ophthalmology He was assistant surgeon emy of Ophthalmology in otolaryngology at the Greenpoint Hospital in Brooklyn and otolaryngologist at the New York University Clinic

Dr Gewanter was graduated from the University and Bellevue Hospital Medical School in 1926 He

was 44 years old

Cologero Giovinco, M D, 77, of Brooklyn, died on January 1 He received his medical degree in 1900 from the Long Island College of Medicine. Dr Giovinco was a member of the American Medical Association, the State and County societies, and was assistant physician at the Bush-

wick Hospital in Brooklyn
George G Lewis, M D, 80, of the Bronx, died
on December 7 He received his medical degree
from Albany Medical College in 1890 He was a member of the American Medical Association, the State and County medical societies, and the Ameri-

can College of Surgeons
Jeremiah N Martin, M D, 74, of Marmaroneck died on January 2 He was a member of the staff and a consultant in cardiology at United Hospital, Port Chester, and was also consulting cardiologist at the Grasslands Hospital at Eastview, New York He was graduated from the Columbia University, College of Physicians and Surgeons, in 1895 Dr. Martin was a member of the American Medical Association, and the State and County medical societies

Edwin A Mason, MD, of Rayermertown, died on December 12 at the age of 69 He was a member of the American Medical Association, the State and County medical societies, and served on the staff of the Leonard Hospital in Troy Dr Mason was

graduated from Albany Medical College in 1902

Daniel V O'Leary, M D, 68, of Albany, died on
December 23 In 1904 he received his medical
degree from Albany Medical College Dr O'Leary became health commissioner and chief of the Municipal Health Commission in 1933 He was a member of the Albany County Medical Society, the American Public Health Association, the Medical Society of the State of New York, and the American Medical Association

John Albertson Sampson, M D, died on December 23 at the age of 75 He was known particularly for his research in endometriosis, and had contributed many articles to medical journals He had been senior gynecologist at Albany Hospital, Albany, since 1937, and formerly was professor of gynecology at the Albany Medical College

Dr Sampson received a doctor of medicine degree in 1899 from Johns Hopkins University, School of

[Continued on page 308]

[Continued from page 304]

Medicine He was a member of the American College of Surgeons and a past-president of the American Gynecological Society He was a member of the American Medical Association, and the State and County medical societies Willes C Sarle, M.D., of Bovina Center, died on November 19 at the age of 88 He was graduated from the New York University, College of Medicine, in 1886 Dr Sarle was a retired physician, having practiced medicine in Unadillu, N. Y., for many years.

ETHER, A CENTURY AGO

One hundred years ago, in 1846, Morton adminstered ether for extraction of a tooth on September 30, and for removal of a tumor of the face on October 16 The September-October issue of Anesthesia and Analgesia commemorates the centenary of so momentous a step in the conquest of pain, which has since marched forward through unflagging researches up to our own day

Prior to Morton, the acute need for palliation of pain was evidenced throughout history by trial and error to overcome the agony of unavoidable emergency surgery

Old medical prints depict forcible restraint of the victim, old literature preserves the tale of spongia sommifera, or drugs known to antiquity, to dull sensibility But when ether brought surer and safer control of an unconscious patient, the doors were opened for hitherto impossible surgical procedures, with increased speed, greater safety and broader scope

Between 1844 and 1847, three inhalation anesthetic agents were given to the world. The agent used by Morton was called letheon, a preparation of ether at first protected by patent, a regrettable mistake very promptly corrected.

take very promptly corrected.

For contemporary reaction to Morton's discovery let us look at accounts of those closest to the immediate events, Dr George Hayward and Dr Henry J Bigelow, visiting surgeons to Massachusett General Hospital. Bigelow expressed disapproval of the patent, considering it "an error of judgment as well as a violation of custom"

Hayward's action was more forceful. On taking over the surgical service on November 1, 1846, he entered into an agreement with Dr J C Warren not to allow patients to inhale Morton's preparation unless all the surgeons were informed of its exact content

Dr Morton was informed of this decision by letter on November 6, he accepted the condition on November 7, and he administered the anesthetic to a patient of Dr Hayward on the following day (the second operation under ether anesthesia) Although pamphlets in support of the patent were issued by Morton's legal agent as late as July of the following year, the validity of the patent ceased, after only five weeks, with the written acceptance of Hayward's demand on November 7, 1846

Like all discoveries ether anesthesia was hailed with an attitude of incredulity which was soon followed by hostility "The last special wonder has already arrived at the natural term of its existence. It has descended to the bottom of that great abyss which has already engulphed so many of its predecessor novelties, but which continues, alas, to gape until a humbug yet more prime shall be thrown into it" So states a New York medical publication. A

similar Philadelphia journal says, "We should not consider it entitled to the least notice, but that we perceive, by a Boston journal, that prominent members of the profession have been caught in its meshes." This journal was "fully persuaded that the surgeons of Philadelphia would not be seduced from the high professional path of duty, into the quagmire of quackery, by this Will o' the wisp." However, Liston and other surgeons of England acknowledged and accepted the discovery at once Again a prophet found himself not without honor

It is astonishing how widely the phenomenon was studied shortly after it had been introduced. Within six months after the first "ether day," Hayward states that several thousand anesthesias had been induced Hemorrhage from the lungs, mania, hysteria, and epilepsy were considered to be contraindications and it was given to children only with great caution Hayward's comment is illuminating "The dangers seem to arise principally from two sources First, from allowing the inhalation to be too long continued, and secondly, from not adopting suitable means by which the lungs can be well supplied with atmospheric air while the inhalation is going on. In respect to the second source of danger, it is very apparent that if the lungs be not well supplied with atmospheric air, the blood cannot be perfectly arternalized, and, of course, a greater or less degree of asphyxia will be the consequence" He recognized anoxemia which could be guarded against "by having the inhaling apparatus so arranged that the patient shall at each inspiration obtain an abundant supply of atmospheric air, while means are at the same time adopted to have this air well charged with the vapor of ether In this way a state of narcotism is, in most cases, readily induced, while that of asphyxia is entirely avoided."

Hayward evidently grasped a basic conception of the underlying principles of anesthesia. After the manner of a conservative scientist he laid the groundwork for the development of anesthesiology when he said, "A great degree of caution is required in its administration, and it therefore can only be regarded safe in the hands of scientific and skillful

persons "

In the mechanical age of today with the fields of chemistry and physics so highly developed, it is not easy to appreciate the value of observation and deduction in the hands of physicians one hundred years ago. Medicine has every reason to be proud of its achievements in recent years, but honor is especially due those of a century ago who introduced anesthesia, a discovery which has been of such inestimable value to the world and yet was accomplished with a then limited knowledge of the related basic sciences—Howard Dittrick, M.D. Editorial, Current Researches in Anesthesia and Analgesia, September—October, 1946

HOSPITAL NEWS

Cancer Committee Funds to Open 14 New Centers

FOURTEEN new centers for the detection of cancer danger signals will be opened in New York with \$187,835, first of a series of grants provided by the New York City Committee of the American Cancer Society, it was announced recently by General John Reed Kilpatrick, chairman of the Board of Managers, and Dr John C A Gerster, chairman of the Medical Committee Arrangements have been completed for immediate opening of the first ten centers and negotiations are in progress for the re-

maining four

"These fourteen centers," said General Kilpatrick, "are the result of demands made on present cancer detection facilities Their purpose is to provide a place where anyone apparently well and without symptoms may go to make sure that he is free from the threat of cancer This service will be provided If abnormalities are found, the at a moderate fee patient will be referred to his physician for treat-If the applicant has no personal physician he will be asked to select a physician from a list approved by the County Medical Society or will be referred to an appropriate clinic if he cannot afford

a private physician
"Because it is estimated that 30 per cent of all cancer victims can be saved if they seek an examination in time, we hope that these new centers will play a large part in saving the lives of many New Yorkers In addition to cases requiring cancer In addition to cases requiring cancer diagnosis, the examinations often will detect early signs of other ailments requiring special diagnosis and treatment The value of the centers in providing relief from worry also will be great, since the examinations will lift a great burden from those found

to be in good health

Seven of the ten centers already arranged for are located in voluntary institutions which will receive appropriations totaling \$57,995 Lenox Hill Hoppital \$10,650, Hospital for Joint Disease \$10,000 New York University School of Medicine \$9,995. Beekman-Downtown Hospital \$8,800, Beth David Hospital \$8,500, and St Vincent's Hospital in Staten Island \$5,000

Three centers will be opened in connection with city hospitals and a welfare center, their appropriation totaling \$21,640 Harlem Hospital \$5,700 with an additional grant of \$1,440 for the establishment of a fellowship of radio-therapy, Welfare Island Hospital \$7,000, and the Kips Bay-Yorkville Health Center \$7,500.

Center \$7,500

For the four centers to be opened when negotiations are completed, the Committee has approved an appropriation of \$46,600

The Committee also has made three special grants for extension of current cancer facilities Memorial Hospital is receiving \$20,000 for additional personnel to increase the capacity of its can-cer diagnostic and treatment clinic, Post-Graduate Hospital \$9,400 to permit operation of a night session as well as a day session of its cancer diagnostic clinic, and to carry out an intensive followup of all patients who visit the clinic, Roosevelt Hospital \$3,000 to provide additional personnel for its cancer chine

Bellevue to Refit Disabled Civilians

BELLEVUE Hospital is embarking upon the most ambitious medical rehabilitation program for disabled civilians yet undertaken in this country, it

was announced recently

Two wards devoted to the new project, patterned after those developed by the Army and Navy during the war, opened on January 1, it was disclosed by Dr Howard A Rusk, head of the Department of Rehabilitation and Physical Medicine at the New York University, College of Medicine

Patients in the new rehabilitation wards at Bellevue, with which the New York University, College of Medicine is affiliated, will be drawn from other divisions of the city hospital, he explained

As a start, the project will have at its disposal 100 beds on the fifth floor of Bellevue's main building, First Avenue and Twenty-Sixth Street, which is now being redecorated to provide a cheerful, friendly atmosphere

The men and women selected for participation in the program will include paralytics and sufferers

from chronic illnesses

Preliminary research and trained staff have been made available by the New York University physical medicinal unit, set up by the Baruch Committee on Physical Medicine two years ago with a grant of \$250,000 This unit, too, plans to expand when Bellevue's new buildings have been completed

Cancer Patients to Get Hospital Care at Home

A NEW plan to provide cancer patients with hospital care in their own homes was launched January 1 by Montefiore Hospital with a grant of \$30,000 from the New York City Cancer Committee The plan is to be a "pilot project," designed to work out a system which may be extended to other hospitals and to provide a practical working test of bringing hospital care into the home for persons suffering with long-term diseases

Among the features the new plan provides are several visits a week by doctors from the hospital staff, daily nursing care by a visiting nurse, transportation to and from the dispensary, medication, and help with the housework when necessary Patients needing hospital care at any time will be transferred to the hospital on short notice

Toward a Better World

There is also progress in sociological betterment promotion of the products of Lanteen Medical Laboratories leaders in their field produced under most exacting scientific standards.

Ease of insertion and placement of the Lanteen Flat Spring Dlaphragm assures continued use No inserter is required. Instruction of the patient is simplified Fitting the largest comfortable size virtually insures proper placing This diaphragm is advertised only to the medical profession and distributed through ethical sources Complete package available to physicians upon request.

Spastic Rehabilitation Hospital Planned

A REHABILITATION hospital for spastic children which would serve as a pilot plant for investigation and treatment of cerebral palsy for the State and Nation will be established by the University of Rochester School of Medicine and Dentistry in cooperation with the New York State Health Department and the National Foundation for Infantile Paralysis

Governor Thomas E Dewey has included in his 1947 budget message to the New York State Legislature an appropriation of \$150,000 for the annual

operating cost of the proposed clinic
Mr and Mrs Ernest L Woodward of LeRoy,
New York, have offered the University a \$500,000 estate of more than 50 acres in LeRoy, including a spacious residence that can readily be adapted to use as a hospital facility, for the project. Plans call for a thorough-going, long-term program of diagnosis. research, treatment, and after care to be directed by the University of Rochester, School of Medicine and Dentistry, and its Strong Memorial Hospital

The project to aid cerebral palsy patients at the LeRoy unit is planned as a model for other institutions throughout the State and Nation, and as a center of training for the various types of personnel concerned with the treatment and care of these Opportunity will be provided for training in any or all of the three major divisions of the enterprise-research at the University of Rochester,

School of Medicine and Dentistry, hospital care at the LeRoy unit, and physiotherapy and occupational therapy

The Foundation-sponsored research program is under the direction of Dr R. Plato Schwartz, associate professor of orthopedic surgery in the

Rochester medical school.

It is expected that the LeRoy unit, proposed to be established by the University of Rochester medical school and its Strong Memorial Hospital can be placed in operation by next summer The large residence will accommodate about 40 patients, from two years of age and up, and a staff of 40 to 45 full and part-time personnel. Ideally suited to the purpose, the spacious home is a modern, three-story brick structure of colonial design. It has a large heated indoor swimming pool which can be used for physiotherapy, spacious rooms, a large sundeck, and an unusually ample kitchen with complete refrigeration equipment. Among other buildings on the estate are a cottage and a large heated garage.

The LeRoy project will be operated as an integral part of the University's Strong Memorial Hospital and School of Medicine, under the proposed plan Patients would be treated at the new institution for a period of several months Both physiotherapy and occupational therapy would be met by providing continuity in the application of the best available

personnel and corrective measures.

Newsy Notes

The board of directors of South Nassau Communities hospital has announced adoption of an over-all plan designed to take care of hospital and housing needs for the next decade, while at the same time allowing the hospital complete facilities for ex-

At the December meeting of the board the building committee was authorized to submit architects plans and specifications covering details for a new maternity hospital of not less than 65 beds completed it will provide housing accommodations for the entire administrative staff on the ground floor *

Members of the Hospital Aid Society have donated \$800 to purchase badly needed equipment for the nursery and children's ward of the Cortland County Hospital. The money, raised during the past few years by the organization, has been kept on hand pending such a need *

A completely equipped department of physical medicine, supplied with approved appliances for this relatively new method of treatment, will be installed in the new building of the North Country Com-munity Hospital in Glen Cove through a gift of \$30,-000 from Henry U Harris of Brookville

This was announced recently by H. Irving Pratt. chairman of the memorial gifts committee of the hospital's \$1,750,000 building fund, through which the community is being given the oportunity to cooperate in creating for the North Shore area a hospital of double the present capacity '

* Asterisk indicates that item is from a local newspaper

The Long Island College Hospital, Brookyn's first major voluntary teaching hospital, cared for 19,000 patients in 1945, according to an annual report made public by Tracy S Voorhees, president of the Board of Regents.

The hospital hopes to raise the number of beds and basenets to 500 to make it the second largest voluntary hospital in the borough, Mr Voorhees said In 1945 the plant handled 8,864 persons and 1,537 newborn babies In addition, 8,731 persons were treated in the twenty-five clinics operated by the hospital *

For Memorial Hospital in Oneonta and Mary Imogene Bassett Hospitals in Cooperstown will be equipped with hot pack machines for treating police patients, it was decided in December at the regular monthly meeting of the Otsego County Chapter of the National Foundation for Infantile Paralysis.

The machines will be the gift of the Foundation. It was announced that Fox Hospital is now accredited to treat infantile paralysis patients sett Hospital was previously accredited.*

Mrs Harold I Pratt has given \$144,900 to the building fund of the North Country Community Hospital in Glen Cove, Long Island, as a memoral to her late husband, who was first president of the hospital. The gift will be used to build a twenty-

three-room section in a proposed new building for the hospital, which will double its capacity *

The new 400-bed former US Public Health Service Hospital on December 6 opened in Sheepshead Bay as the first veterans hospital in Brooklyn It will handle convalescent patients who are being rehabilitated

Chief Medical Officer Dr James E Boyd heads a staff of 150 physicians, nurses, and technicians tentative table of organization calls for a staff of That figure includes thirty specialists in surgery and medicine *

At the Helm

Dr Courtenay L Bennett, supervising psychiatrist at the Hudson River State Hospital has been appointed medical director of Craig House, Beacon, and he assumed his new position January I, Dr Wirt C Groom, acting director of the Hudson River State Hospital, announced Dr Bennett has been affiliated with the State Hos-

pital here since January 2, 1937, with the exception of the time he served in the armed forces when he

was on military leave of absence
Making known that Dr Bennett had resigned
from the State Hospital staff, Dr Groom said that "Dr Bennett has given the hospital outstanding professional service and we regret having him leave us"

A native of Schenectady, Dr Bennett was graduated from Colgate University and the Columbia University, College of Physicians and Surgeons interned at French Hospital, New York, after which he entered state service here as a medical interne

On March 4, 1938, he was appointed assistant physician and on May 16, 1941, he was designated semor assistant physician. Prior to entering the armed forces, he was placed in charge of tubercular service at the State Hospital, an activity he resumed when he returned to the hospital April 19, 1946

Dr Alfred P Upshur, who has been commanding officer of War Department hospitals in two world wars, assumed his first supervisory civilian "job" January 1 when Halloran General Hospital became Halloran VA Hospital

Long familiar with hospital procedures, Dr Up-shur organized and commanded U.S. Army General Hospital Number 3 in Colonia, New Jersey, during World War I The hospital had a bed capacity of 1,650, 150 more than the VA bed capacity of 1,500

at Halloran after January 1
From July 23, 1943 until December 15, 1945, he
was commanding officer of Lagarde General Hospital New Orleans' counterpart of Halloran September 6, he was commanding officer of the Army and Navy Hospital, Hot Springs, Arkansas He was separated from the service last October 30 and "went to work" for the VA five days later *

William G Illinger, White Plains Hospital Administrator, has been elected president of the Westchester County Hospital Association at its annual meeting in the Roger Smith Hotel The association has 31 member hospitals

Victor Smith, of Catskill, has been re-appointed a member of the Board of Managers of Memorial Hospital of Greene County for a term of five years, beginning January 1, by the Green County Board of Supervisors *

Dr Ralph L Cudlipp has received official notice that he has been elected by the physician's staff of Potsdam Hospital to join its staff

The William Henry Welch Lectures are to be delivered by Dr David Rittenberg, assistant professor in biochemistry, College of Physicians and Surgeons, Columbia University on "The Application of the Isotope Technic to Problems of Biology and Medicine" The lectures will be in the Blumenthal Auditorium of the Mount Sinai Hospital, 1 E 99th Street, New York City, on Wednesday, February 5 at 8 30 P.M. and Friday, February 7, at 8 30 P.M.

Dr Bernard T Brown, superintendent of the Onondaga County Sanatorium, is the new president of the New York State Association of Superintendents and Managers of Tuberculosis Sanatona

He was named to his new office at the recent annual meeting of the association in the Ulster County Tuberculosis Hospital, Kingston. All tuberculosis hospitals of the State, and about 30 county institutions, were represented at the conference

A native of Onondaga County and a graduate of Syracuse University, Dr Brown has been a member of the staff of the Onondaga Sanatorium since 1942 He was named superintendent on March 1, 1944

Dr Brown at one time practiced medicine in Albuquerque, New Mexico, later moving to Cazenovia. He became interested in treatment of tuberculosis after he was stricken with the disease in 1998. He since has devoted his entire time to the study of the disease

For his outstanding community service in this field, he was awarded a citizenship medal recently by Henry Makyes Post 1101, American Legion, of Onondaga Hill. He was commended for his outstanding ability and treatment of veterans of World War II, who are confined to the sanatorium.

Dr Roscoe D Roadruck has been appointed manager of the Veterans Administration Hospital at Saratoga Springs, succeeding Dr Adrian C Gould, who recently was named manager of the adminis tration's hospital at Sampson

Dr Roadruck, a native of Nebraska, served with

the Army Services Forces from March, 1942, to September, 1946, when he was released with the rank of major. He recently was chief of medical service at Batavia Veterans Hospital. He is a specialist in neuropsychiatry and a member of the American Psychiatric Association

Dr Harry A. Steckel, of Syracuse, director of Syracuse Psychopathic Hospital since July, 1930, retired from the hospital post February 1 to enter private psychiatry practice in Syracuse and to work with the Veterans Administration

Dr Steckel also has been professor of pscychatry at the College of Medicine, Syracuse University, since coming here in 1930 Previously, he was superintendent of Newark State School and clinical

director of Binghamton State Hospital.

A colonel in the medical reserve Dr Steckel served in World War I as a first heutenant in the Army Medical Corps in France. During the last war he was a member of the psychiatric advisory committee of the selective service system.

He is a member of the neuropsychiatric committee of the National Research Council, of the American Medical Association, of the American Medical

Editors and Authors' Association, of the Medical Society of the State of New York, the Syracuse Academy of Medicine, the American Psychiatric Association, the National Committee for Mental Hygiene, and the New York State Committee on Mental Hygiene

A native of Catasauqua, Pennsylvania, Dr Steckel was graduated with a doctor of medicine degree from the University of Pennsylvania.*

E J Van Deusen was elected president of the Alice Hyde Hospital in Malone by the board at the annual meeting, succeeding D N Callander, who has headed the organization for the past two years Dr Joseph Wilson was chosen vice-president, succeeding Mr Van Deusen in that office William J

Herron was re-elected secretary and Claude Clark was re-elected treasurer *

Dr Louis E Marshall, of Brooklyn, former army pathologist at Pine Camp, has been appointed fulltime pathologist of the House of the Good Samantan in Watertown, to fill the vacancy created by the resignation of Dr Francis W Porro *

Improvements

Rocklyn Lodge of B'Naı B'Rıth presented the maternity wing of Mercy Hospital with a resuscitator and an anesthesia machine on December 19

The formal presentation was made to Sister Marie De Chantel, Hospital superintendent, by Irving Goldsmith, chairman of the lodge's community service committee *

Four hospitals in Brooklyn have been presented

with iron lungs and a fifth has been given a resuscitator The equipment, the gift of the Brooklyn Association for Masonic Charities was presented in ceremonies at the Brooklyn Masonic, Temple.

The hospitals receiving the respirators were Long Island College Hospital, Izrael Zion, the Norwegian Lutheran and St Mary's hospitals The resuscitator will be given to the Bushwick Hospital

MEDICAL NEEDS OF THE PHILIPPINE ISLANDS

The medical centers of the Philippine Islands have been largely wrecked by the war's combats There is little left in the way of buildings and equipment and the medical personnel is working bravely under enormous difficulties Immediate aid is essential to maintain these worthy institutions in the form of donations of books, instruments, and medical magazines—they need these as much as they need

money The Filipinos gave signal help and sacrificed much to aid our victory They ment our aid

and support

The Medical and Surgical Relief Committee has been of great assistance in collecting and forwarding materials to Manila Contributions may be sent to their office at 420 Lexington Avenue, New York City

FOCUS OF INFECTION

The woman's anxious voice came over the phone "Dr, can you come out to 211 East 9th to see Jim Johnson?"

"I imagine so What's his complaint?" "He's complainin' he's sick."

"I know But is he sick in the head, sick in the stomach, or just where is he sick?

"Oh," came the reply, "he's sick in the little room on the third floor in the front"—S H. BURNETT, M D -Medical Economics, November, 1946

chable to 3 to 4 Miles ,

If You Are Reading a Paper at the 1947 Annual Meeting

the NEW YORK STATE JOURNAL OF MEDICINE will appreciate your following the suggestions listed below in the preparation of your manuscripts These suggestions have been devised in order to save correspondence. avoid return of papers for changes, minimize the work of preparation for the printer, and save the high costs of corrections made on galley proof

Size of Articles.—It is earnestly desired that scientific articles shall not exceed 6 Journal pages at the outside Longer articles tend to lower reader interest An average of five or six seems to be the most desirable from this point of view Calculation can readily be made by multiplying the number of double-spaced typewritten manuscript pages by the fraction two-fifths, eg, twelve manuscript pages will make five Journal pages

Manuscripts - Papers must be typewritten on one side only of white sheets consecutively numbered, and be double spaced with one-inch margins They should be prepared with great care so as to be typographically correct. All headings, titles, subtitles, and subheadings should be typed flush with the left-hand margin. This is imperative for rapid and accurate composition by the printers

Titles.—The title should be brief and typed in capital letters. The subtitle can be longer and should be typed in caps and lower case letters Under the title, or subtitle, if there is one, should appear the name of the author and city in which he lives Directly under his name should be the hospital or institution with which he is affiliated.

Subheadings -Subheadings should be inserted by the author at appropriate intervals

References.—It is the unfailing practice of the New York State Journal of Medicine to use There should appear in the text reference numbers, typed above and to the right of the word to which there is a reference. A list, consecutively numbered, of these references should follow at the end of the manuscript (Note that spelling in list is same as in text) The arrangement should be as follows and should include all items

a. Books—author's surname followed by initials title of book, edition, location and name of publisher, year of publication, volume, and page number Thus, Osler, W Modern Medicine, 3rd ed, Philadelphia, Lea & Febiger, 1927, vol 5, p 57 Periodicals—author's surname followed by initials, name of periodical, volume, page, month (day if necessary), year of publication Thus, Leahy, Leon J. New York State J. Med 40 347 (March 1) 1940

The JOURNAL does not include titles of Note articles

Case Reports.—Instead of abstracts of hospital histories, authors should write these reports in a narrative style with properly completed sentences. All unimportant details should be deleted with such general negative statements as fit the case

Tables —While tables are very useful on lantern slides in the reading of papers, they fail of this purpose to a large extent in the printed page. For that reason it is urged that they be reduced as much as possible to descriptive language

Illustrations.—These should be kept to the minimum necessary to make clear the points to be registered by the author In some instances they are imperative to proper understanding, in others they are merely picturesque. The latter can be excluded to good effect, both as to space

and the not inconsiderable cost

When illustrations are to be used they should accompany manuscripts and each should always accompany manuscripts and each should always be referred to in the text, preferably by number Drawings or graphs should not be larger than 12 × 16 inches, and must be made with jet black India ink on white paper Do not use typewriter for lettering The smallest lettering on 8 × 10 inch copy should be no less than ½ inch high Cross-section paper (white with black lines) may be used, but should not have more than 4 lines per inch. If finer ruled paper is used, the major division lines should be drawn in with black ink, omitting the finer divisions In the case of finely ruled paper, only blue-lined paper can be accepted Lettering and all markings must be large enough to be readable after reduction Mail rolled or flat, never fold Photographs should be very distinct and show clear black and white contrats They must be on glossy white paper Avoid round and oval photographs Whenver possible "crop" photographs, i.e., mark portion that can be excluded when reproduced the company of the compa

Crop marks should be on margin of photographs Do not run pencil lines through photographs

It is important to mark the top of the illustration on the back, also its number as referred to in the text, thus, Fig 1, 2, and the name and adress of the author

Legends should be typewritten on one sheet of

paper and attached to the illustrations

it's surprising how many people believe what amounts to the same thing

That is, many of us have a dreamy notion that somewhere, sometime, we'll come upon a good deal of money We go along from day to day, spending nearly all we make, and believing that somehow our financial future will take care of itself

Unfortunately, this sort of rainbow-chasing is much more apt to make you wind up behind the eight ball than with a pot of gold

When you come right down to it, the only sure-fire way the average man can plan financial security for himself and his family is through saving—and saving regularly

One of the soundest, most convenient ways to save is by buying U S Savings Bonds through the Payroll Plan

These bonds are the safest in the world They mount up fast And in just 10 years, they pay you \$4 for every \$3 you put in

So isn't it just plain common sense to buy every U S Savings Bond you can possibly afford?

P S You can buy U S Savings Bonds at any bank or post office, too

SAVE THE EASY WAY. BUY YOUR BONDS THROUGH PAYROLL SAVINGS

two weeks for an answer

When the diagnosis of male climacteric is suspected but not definitely proved a therapeutic test with ORETON (testosterone propionate) will provide the answer in two weeks. If androgen deficiency is the cause of symptoms, they will be alleviated by intramuscular injections of male sex nor mone as ORETON 25 mg daily for 5 days weekly over a two weeks period Subsequently manifestations of the male climacteric may be controlled with the same dosage injected two or three times weekly and eventually equilibrium can be maintained with ORETON M (methyltestosterone) Tablets.

ORETON

ORPTON (testosterone proploante in oil) for intramuscular injection, in ampules of 1 ce containing 5 10 and 25 mg., in boxes at 8, 8 and 30 Multiple dose vials of 10/cc., 25 mg per re. Box of 1 vial ORETON M (methylicstosterone) Tablets 10 mg., in boxes of 15 20 and 160 T ad-M ix ORETON and ORETON M—Reg. U 8 Pen.OS.

Hydrocholoresis

IN GALL Bladder Therapy

Subsiding scute cholecystkis precipitated by obstruction of the cystic duct by pigmented stone

In chronic cholecystitis the tenacious thick bile is an additive cause in prolonging the condition by obstructing the bile passages and discouraging physiologic drainage

KETOCHOL, by increasing the production of thin aqueous, free flowing bile in the liver¹ (average increase 144 per cent²) initiates the physiologic action desirable for symptomatic control

Ketochol contains all four of the bile acids normally present in human bile in their keto (oxidized) form It has been pointed out³ that all the important bile acids as contained in Ketochol are therapeutically superior to single acids in pure form.

treat pyodermas with tyrothricin inside the lesion

You can now treat follicular disorders inside the lesion with Introderm Tyrothricin Solution

Clinical results proved that Intraderm Tyrothricin's penetrant qualities and powerful bactericidal action on grampositive organisms gave favorable response in 232 patients1

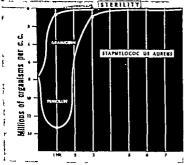

> Intraderm Tyrothricin penetrates normal and diseased skin through the followlar apparatus.

Unlike usual tyrothricin suspensions Intraderm Tyrothricin contains 1,000 mmg of tyrothricin per ml in true solution Surface-active agents keep both components of tyrothricin gramicidin and tyrocidine present in molecular form

1 MacKee G M., Sutzberger M B., Herrmann F., and Larpe, F L., J Invest. Dermat. J.113 (1918)

Bacteria Quickly Killed by Intraderm Tyrothricin

Tyrothricin kills bacteria faster than either penicilin or the sulfonamides. It stimulates for mation of granulation tissue and is non toxic in the usual sense. Neither serum nor necrotizing tissue mactivate tyrothricin Sensitization to tv rothricin has not yet been reported

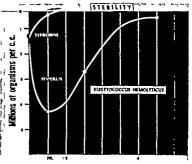

Graph demonstrates the effect of equivalent amounts (10 micrograms per ee) of gramicidin and penicilim on Staphylococcus aureus

When conditions permit growth penicillin allows an increase and then slowly reduces the number of viable organisms.

of a series honoring the contributions of eminent personalities of medicine and pharmacy

WILLIAM PROCTER, JR.-1817-1874 Sharmacust and Teacher

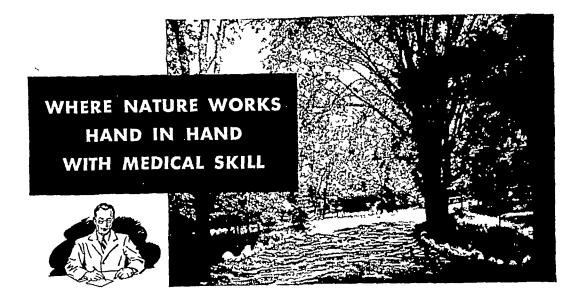

Hailed even in his own time, as the father of American pharmacy, William Procter, Jr was distinguished as an educator and scientific editor

In 1846 his alma mater Philadelphia College of Pharmacy named him professor of pharmacy—the first such chair in the United States He was elected president of the American Pharmaceutical Association in 1862

Collaborating with Theophilus Redwood he compiled Practical Pharmacy', the first textbook of its kind published in this country, as editor of the American Journal of Pharmacy, Procter contributed no fewer than 550 original articles, and made many valuable contributions to successive editions of the U S Pharmacopoeia.

Truly, the profession of pharmacy owes much to this honored leader and as pharmaceutical manufacturers, we pledge adherence to the high standards of professionalism which Proceer propounded.

The Warrower Laboratory, G

Restorative treatments in the relaxing environment of the Saratoga Spa have become more widely known in medical circles as, year by year, increasing numbers of physicians have found them beneficial to patients

The therapeutic powers of the Spa's naturally carbonated mineral waters are being utilized more extensively than ever, for postwar strain is bringing us an unusually large number of patients suffering from cardiac, rheumatic or vascular disorders of a chronic nature

Here your patient, relaxed in mind and body, is in skilled hands which are guided by your directions in a regimen of treatment that you recommend Well trained physicians are available in Saratoga Springs for consultation with your patient on the details of the program

Thus the Spa lightens your heavy burden, with full assurance that your patient will receive the best of care to prepare him for your continued medical direction

"PHYSICIAN, GIVE HEED TO THINE OWN HEALTH"

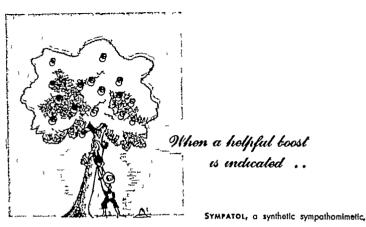

Many physicians have recently come to the Spa for the same kind of treat ments that helped their patients here After a restorative "cure" at the Spa, you, too, would return to your practice refreshed—revitalized—ready for the busy days that still he ahead

Listed by the Committee on American Health Resorts of the American Medical Association

THE EMPIRE STATE'S CONTRIBUTION TO THE MEDICAL PROFESSION

For professional publications of the Spa, and physician's sample carton of the bottled waters, with their cnalyses, please write W S McClellan, M D, Medical Director, Saratoga Spa, 166 Saratoga Springs, N Y

acts on the heart and vascular system to provide a "boost" to peripheral circulation produces definite subjective improvement with virtual freedom from anxiety psychic excitation and other manifestations of central nervous system stimulation.

Sympatol*

To improve peripheral circulation

THERAPEUTIC APPRAISAL (Oncilly effective Sympotol roless venous and symbic pressures significantly distrible pressures only slightly, shortest circulotion fise; increases cardioc and selects volume output, increases cardioc efficiency, frequently slows the pulse rate.

INDICATED for the symptometric treatment of circulatory atony associated with hypotemison, convolutionics, mild collapse, and other artheric states.

DOSAGE*; Adults—1 to 3 tablets three times daily or 1 or 2 cc. of solution every 4 to 6 hours. Children—5 to 20 minims of solution as regarded.

he combined use of an occlusive diaphragm and vaginal jelly remains, in the published opinions of competent clinicians, the most dependable method of conception control. .

Dickinson has long held that the use of jellies alone cannot be relied upon for complete protection. It is noteworthy that in the series of patients studied by Eastman and Scott², an occlusive diaphragm was employed in conjunction with a spermicidal jelly for effective results Warners, in a carefully controlled study of 500 patients, emphasized the value of a diaphragm.

In view of the preponderant clinical evidence in its favor, we suggest that physicians will afford their patients a high degree of protection by prescribing the diaphragm and jelly technique.

You assure quality when you specify a product bearing the "RAMSES"* trademark.

Glycerite of Hydrogen Peroxide spe

Clinical studies concerned with the use of Glycerite of Hydrogen Peroxide in the treatment of chronic purulent otitis media demonstrated seventeen of twenty nine patients in complete remission in 14 days and the remainder by the 38th day. The patients studied presented conditions existent for periods of 2 weeks to over 40 years. Previous treatment by the usual thera peutic means including tyrothricin or penicillin was ineffective in all cases.

Constituents:

Hydrogen Peroxide 1 446% Urea (Carbamide) 2.554% 8-Hydroxyquinoline 0 1 ** Dissolved and stabilized in substantially anhydrous glycerol q.s. ad 30cc.

Available on prescription in one-ounce bottle with dropper Administration. One-half dropperful two to four times daily

THE many conditions in the manage ment of which protein supplementation is indicated demand palatability and completeness, both of which are difficult to obtain. The answer is in PENDARVON—deriving its completeness from enzymatic hydroly sates of yeast, casein and lactalbumin with added dl methionine and vitamins of the B complex, and presented in unusually palatable form

Working hand in hand with amino acids, vitamins of the B complex are available in effective amounts in PENDARVON The close association between amino acids and B complex vitamins has been shown.*

Six heaping teaspoonfuls (approx. 24 Gm) supply 2.4 times the minimum daily adult requirement of thiamine, 0.6 times the minimum daily adult requirement of riboflavin and 12 milligrams of macinamide.

PLEASANT TO TAKE:

Pendarvon prepared with hot water has the flavor and appearance of a clear tasty bouillon. May also be taken in soups and tomato or other vegetable fuices.

INDICATIONS:

Protein lossi burns draining abscesses diarrhea; increased protein requirements; pregnancy lactation hyperthyroidism; impaired protein ingestion and digestion pre- and post-operatively gastrointestinal diseases; other deficiencies: anemia and B avitaminoses and in hepatilis.

HOW SUPPLIED:

Pendarvon is presented in 8-ox bottles in the form of porous granules which disperse instantly and dissolve completely in hot water

Let us send you a trial supply for

intensive sulfonamide therapy

By combining sulfadiazine and sulfathiazole in a single preparation the dangers of crystalluris and its troublesome complications are greatly reduced Recent studies have shown that the total urine solubility of two sulfonamides is greater than that of a single sulfonamide since the presence of one exerts little influence upon the solubility of the other Consequently a greater total quantity of concurrently administered sulfadiazine and sulfathiazole can be dissolved in the urine than of either drug alone

Added renal protection is provided in Aldiazol by the presence of sodium citrate and sodium lactate which alkalinize the urine and further increase sulfoamide solubility.

Rapid absorption of Aldiazol is promoted since the contained sulfadiazine and sulfathiazole are in microcrystalline form. In consequence higher blood levels are att-seed in shorter time than with ordinary sulfonamides.

Aldiazol is indicated whenever sulfonamide therapy is called for Because of its liquid form, it is especially useful in children facilitating accurate dosage as well as administration.

Rach teaspoonful of Aldiazol contains:
Sulfadiazine (microcrystalline) 0.25 Gm. Sodium Citrate
Sulfathiazole (microcrystalline) 0.25 Gm. Sodium Lactate

0 46 Gm. 0.55 Gm.

ALLERGY OR DEFICIENCY?

Infantile eczema may be due to allergy But it may also be due to deficiency of an essential unsaturated fatty acid

The infant on a cow's milk formula gets only one-fifth as much n-linoleic acid as the breast-fed infant. The blood of most eczematous infants is low in linoleic acid and most cases respond dramatically when the deficiency is relieved.

Soyola should be tried in such cases. It is a stable, palatable emulsion of soybean oil, a rich source of n-linoleic acid.

Current Trends in Medicine

Writing of the next ten years in medicine ¹ and remarking on current trends in medical care, Dr Willard C Rappeleye, Dean of the College of Physicians and Surgeons, Columbia University, accents the fact that "medicine today is in a stage of rapid evolution"

He points to the phenomenal growth of medical knowledge during recent years and growing public concern over the health of the population as a whole, and views the hospital as the natural center for all forms of professional education for doctors, nurses dentists, technical aids of every kind attendants, administrators, and the local general public

At present, he says, in this country there is one doctor to about 750 persons, a ratio two to five times that found in any country in the world previous to the war. He believes that the creation and proper main temance of hospital centers is the solution to a better distribution of existing doctors and future graduates, wherever the local health needs justify such centers.

Significant is the fact that

Young medical graduates, nurses, and other trained professional workers will not go into

1 New York Medicine, Vol. II No. 15 Aug. 5, 1945

practice in small communities or rural districts unless modern facilities for practice are available Until such opportunities exist or are created financial subsidies or other inducements alone will not suffice. It is in such institutions, also that the younger graduates can be more effectively utilized than they are today. Perhaps the greatest waste of medical manpower in our present scheme of medical services occurs in that period of from five to ten years after completion of hospital training when younger physicians are only partly occupied in the early stages of practice

On this subject Dr Rappeleye should be particularly well informed. His contention is quite logical, but in our opinion regretably so. The tendency to provide better facilities for rural areas and small communities can well lend to overhospitalization and to an intensification of what is even now too frequently seen among young physicians, a nelgect of the patient.

While it is freely granted that laboratory and consultation facilities make possible the opportunity for more scientific medical investigation, the fact of their availability tends to cause the young medical man to rely more on technology and ancillary services and less on his own clinical observation and ingenuity. This seems to result in

the mechanization of practice aided, perhaps, by too great confidence in the efficacy of the newer synthetic pharmaceuticals Maybe this is inevitable Quite possibly our older concepts of the importance of the patient as an individual have been wrong, maybe clinical observation, the tactus eruditus. the listening ear, have little place in modern practice. It could well be that they served a purpose only as long as the alleged wonders of modern technology did not exist, that with the advent of purely scientific medicine we must agree with Burton¹ that "diseases crucify the soul of man, attenuate our bodies, dry them, wither them, shrivel them up like old apples, make them so many anatomies"

¹ Anatomy of Melancholy (Ca. 1621)

Under such a concept, sickness becomenable to highly mechanized, exclusing scientific management. The young more practitioner is often a bibliophile, a quenter of laboratories, a student of diserather than of the people who have the Rarely an Osler or a Holmes comes forward to restore the patients to their deservation prominent place in the practice of medical Dragged from obscurity, these "old applasso designated by Burton, seem deservation more than merely scientific investigation treatment."

That should be the minimum corded them in our view But then, we probably old fashioned and crotchety boot

The Physician-Veteran and the Hospital

Says the Journal of the Medical Society of New Jersey² of the younger physician-veteran

Except in a very few specialties, a doctor cannot practice medicine today without access to a This puts some of the younger physician-veterans in the difficult position of losing all major patients to their older colleagues, or to those "essential" younger doctors who stayed home during the war and established hospital connections Especially hard hit is the small but important group of physicians who entered service directly from internship or residency They are not helped by the rank-freezing order which protected the staff appointments of doctors who already had hospital connections institutions will give these young veterans a place on the courtesy staff As a result, the doctor in such a position has no place to take a maternity case and is obliged to give up other patients who need hospitalization, or he is forced to try to treat such patients at home No one seems to be doing anything about the plights of these hospital orphans

It is well to face the fact that some hardship in the matter of the physician-veteran and the hospital is inescapable. What conditions are found in New Jersey probably would be the same generally for the country. The issue should be faced now, and conditions rectified locally as may seem most practicable. The Journal is quite right in saying local medical societies cannot initiate structive plans, they may suggest, for ample, at the county level, the necessity action, but local hospitals are autonomand make their own rules

The Journal makes the constructive gestion that

The only practical solution is a deliberate cooperative arrangement among the hospita New Jersey whereby each institution will: tranly accept two or three such veterans tributed in this way, the entire continge aggregating perhaps 150 or 200 physiciansbe absorbed without seriously disturbing staff If a hospital with 100 doctors on its li already overstaffed, the increase of the numb 103 will not make much difference Under an arrangement, the veteran will not always l the hospital of his choice Indeed, assignr will probably have to be made on a geogra basis However, it will give him at least one stitution where he can practice major medi and remove one justifiable sore spot in our ! tions with demobilized doctors

The hospital associations might well esider the advisability of action along lines suggested. The matter is within the province. Such relief as the hospitals give will depend on the willingness of local medical profession to cooperate whospital authorities. Of this there can be question in our opinion.

² Vol 3, No 11, Nov 1946, p 447

Nazı Physicians

As this is being written at least 23 doctors of medicine and numerous German scientists, medical administrators, and others are being brought to trial for "atrocities" against prisoners, the indictments being under four counts conspiracy, war orimes, crimes against humanity, and membership in the criminal organization of the Elite Guard which practiced a macabre science of killing 1

At the request of the Federal government, the Board of Trustees of the American Medical Association delegated Dr A. C Ivy, vice-president of the University of Illmois, "To represent the Association in an investigation of these acts of inhumanıty

The trials will develop the testimony and show the degree of participation and guilt of these physicians in such acts of in-To us, the abandonment of all professional restraint, departure from ngid codes of ethical conduct based on the welfare of the individual patient seems inconceivable The foundation of the confidence in any physician by his patient is based upon the belief that the doctor, with all available knowledge and means, will fight to the last ditch to alleviate suffering and to cure if possible This is the doctorpatient relationship, the sine qua non of the art of medicine It permits of no compromise, no discrimination, no relaxation of vimlance

The sorry and degrading thing to which some Naza doctors allegedly descended merely serves to illustrate, in our opinion, the dangerous impact of political ideology on professional standards In this instance it was the lunatic doctrines of Hitler's debased philosophy But what occurred as a result, exemplified by these tragic in stances, should be thoughtfully considered by those who would promote "state medicine"

Control over medical education, medical practice, and medical science by the state can, in extreme cases such as these, produce extreme moral degradation. But these instances are merely the outstanding ex-What of civil practice under amples statism?

In an era of rapid scientific discovery not only in medicine, but also in theoretic mathematics, physics, chemistry, and allied fields the capture of the medical profession by the system of state socialism initiated by Bismarck in Germany did not hinder but actually assisted the growth and progress of medical science by throwing behind the universities the resources of the state. One remembers the initial progress made with admiration

But if the financial resources of the state were of benefit initially to medical science. these benefits could not be divorced from the political system which produced them Medicine was thus integrated into the system of state socialism with the result that it became dependent utterly upon the system The result we have seen

As the state deteriorated to national socialism under inhuman and perverted leadership, medicine and medical men deteriorated likewise. It is well to remember from this object lesson that what the state can do for you is often not so important as what the state can do to you It is something to think about.

Can Spring Be Far Behind?

During the recent war we deplored editorially in these pages the necessity for omission in the public prints of those small items which in happier days seemed to herald the approach of Spring Small things, perhaps,

New York Times, Dec. 10, 1946. J.A.M.A 132: 714 (Nov 23) 1946

but significant, bearing a message of hope during the dark, cold days and nights of the winters of our discontent that better things were ahead

Many of these items in days of yore emanated from the vicinity of Winsted Connecticut, for some reason, though Loch Ness, Scotland, was often in the news about this time of year with its recurrent sea serpent tales, complete with eye witnesses Recently, since we are now on a global basis, the gazelle boys of Asia Minor have come into their own, somewhat out of season it is true, but doing their bit to distract the mind of man from the more serious political, economic, and diplomatic crises which, like the poor, are always with us

Imagine our delight, therefore, as we prepared between shivers to write a brief note on the forthcoming Annual Meeting of the Medical Society of the State of New York to be held in Buffalo in May of this year, to find in the public prints the usual crisis, this time the outlaw strike of 16,000 workers, truckmen, and sympathizers in London, England, apparently unmindful of the blessings of their socialist government. Then, if these old eyes could be trusted, from Atlanta, news of a two-headed State! Not from Winsted, mind you, but from Atlanta, Georgia. And, further, under dateline of Chicago, Illinois, there is note of a 4-year-old boy with a complete set of false teeth! Will wonders ever cease? Annual Meeting, a state with two governors, 4-year-old boy with full dentures the size of a half-dollar, can Spring be far behind? Connecticut papers please copy

Current Editorial Comment

Public Relations The Houses of Delegates of both the AMA and the State Society are keenly interested in the problem of public relations and its effect on the medical profession as a whole and the individual doctor in particular

After reviewing some of the recent bills affecting the profession that have been brought before the Federal and State legislators, both Houses passed resolutions urging greater participation by both local societies and the individual doctors in the important field of public relations, and urged as one means of achieving it the establishment of speakers' bureaus in every society

As a step in this direction, the Public Relations Bureau of the State Society has employed Mr Thomas E Walsh, to conduct a survey to determine how best this work can be facilitated

At present Mr Walsh is engaged in visiting the local societies to determine whether or not they already have or desire to establish a speakers' bureau. He is also attempting to determine what kind of help the individual doctors feel the State Society can furnish them in this vital work.

We therefore urge that county officers, and, especially, chairmen of Speakers' Bureaus and Public Relations Committees, be on the lookout for Mr Walsh Better still, if you have any questions regarding a speakers' bureau, write to the Public

Relations Bureau, Medical Society of the State of New York, 292 Madison Ave, New York 17, New York

The Centennial. Two months ago the American Medical Association announced to the readers of its *Journal* that its Centennial Session would be held at Atlantic City, June 9 to 13

For the benefit of our readers, we made an earnest attempt to summarize the program We might as well have tried to summarize the Encyclopedia. There will be distinguished foreign guests. There will be presented the latest thing in every field, such as the use of radio-active products in medicine, advances in psychosomatic medicine, the use of antihistamine preparations, and many others

Atlantic City will be crowded and it may be hot but, aside from vulgar personal considerations, we should say that the Centennial Session would be something that no one would care to miss

We feel a modest pride in seconding the invitation, for it was in New York, one hundred years ago, that a group met for the purpose of forming the American Medical Association. True, local jealousies prevented them from doing so that year, but they did achieve organization the following year in the less troubled atmosphere of Philadelphia. The Medical Society of the State of New York is proud of its lusty child and wishes it all success as it starts its second century.

¹ New York Times, Jan 16, 1947 p 1

Pyribenzamine and Benadryl in Allergic Since Dale and Laidlow in Conditions 1911 expressed the theory that anaphylac tic shock is due to the sudden release of histamine, much evidence has been presented to incriminate histamine or a histamine-like substance as the immediate cause of the urticarial wheal, hay fever, and other manifestations of allergy cflort to relieve or cure those conditions. experiments were undertaken to discover a drug that will neutralize or block the effects of histamine Hopeful results were obtained by Bovet and Straub in Paris in 1937 and 1939, but the products were too Since then the chemicals with which they worked have been investigated and tested by scientists working in American pharmaceutic laboratories, with the result that today we have benadryl and pyribenzamine

In a review of the ments of antihistaminic drugs, Epstein1 considers those two drugs together because their physiologic and antiallergic action is similar are highly specific against histamine, but in addition, they are mildly effective against acetylcholine, they produce sleepiness, dizziness and, occasionally, dryness of the mouth, nausea or diarrhea Of each the dose by mouth is 50 mg, three times a day In animals, those drugs are twelve to fifty times more toxic when given intravenously Given by mouth, they are of low toxicity If toxic signs (vertigo, sleepiness, nausea) appear, it is usually safe to continue their use in smaller doses

Both pyribenzamine and benadryl are found useful in the symptomatic treatment of urticaria and hay fever, and somewhat less useful in perennial rhinitis, asthma, atopic dermatitis (allergic eczema), and other diseases due to allergic reactions The efficacy of the drugs are about equal, and approximately the following percentages of rehef may be expected from their acute urticaria-95 per cent, chronic urticaria-80 per cent hay fever-80 per cent, extrinsic allergic rhinitis-80 per cent, pruntis of atopic dermatitis-about 60 to 90 per cent, and in bronchial asthmaabout 40 to 50 per cent The relief obtained by the use of benadryl or pyribenzamine is symptomatic, the symptoms in chronic allergies returning when the drug is withdrawn

At Least, Not Yet. We think it was de la Roucheloucauld who said "There is always something in the misfortunes of our friends that does not quite displease us"

This morning, after we had brought ourself abreast of the latest developments in the labor situation, after we had mastered our nausea over the statistics of lowered production, decreased exports, etc that would result we turned to foreign news in the hope of finding something cheerful In no time at all we came upon this gem

London November 30 (UP)—Sixty four doctors and nurses—the entire medical staffs of two London hospitals—have received dismissal notices for refusing to obey an order of the Willesden Borough Council to join a trade union it was disclosed today. The Council's action leaves only one doctor, the medical superintendent, to care for 100 pa tients at Willesden Maternity Hospital

Socialized Medicinel The closed shop applied to doctors. We are a little vague as to what the Borough Council of Willesden is, but somehow we feel a little safer with our mothers and babies in the hands of medical men selected by Boards of Trustees. We are glad we don't have to join a union if we don't want to

Oh, and by the way, what happens to the mothers and the babies? The Council bent on asserting its authority seems as indifferent to their fate as Mr Lewis was to the general suffering he was causing

Penicillin. The topical use of penicillin ointment is becoming a standard form of therapy in industrial clinics. All clinical thera peutic trials of the past several years have demonstrated the effectiveness of this new antibiotic agent when incorporated in a suitable cintment base and used locally in the treatment of impetigo contagiosa, sycosis barbae, infectious eczematoid dermatitis, ecthyma, furunculosis, car buncles, chronic ulcers of the extremities, and other susceptible infections of the akin treatment of staphylococcic and streptococcic local infections of the skin has produced the most dramatic results. It has proved to be of value in the treatment of secondarily infected lexions which are superimposed on dermatophytosis, acne vulgaris, and contact dermatitis

Penicillin is not a cure-all for skin infections. It will not replace accurate diagnosis and other specific therapy, nor will it replace surgery and debridement. But when used locally, penicillin is an ideal antiseptic.¹

IN MEMORIAM

William Hale, M.D

President of the Medical Society of the State of New York

A great loss has been sustained by the Society in the sudden and unexpected death of Dr William Hale, of Utica, who died there on January 16, 1947 He took office in New York in May, 1946, at the last Annual Meeting of the Society Dr Hale endeared himself by his character and attainments to a large circle of friends and colleagues both in Utica, where he was regarded as one of its eminent practitioners, and throughout the State, many parts of which he had visited officially during his brief term of service as President He was a quiet, but forceful and impressive speaker, devoted to his tasks and duties, and the memory of his presence will long remain among his associates.

Dr Hale was born in Gananoque, Ontario, sixty years ago He attended Amherst College and was graduated from the Queen's University Medical School in Kingston, Ontario, in 1910, and began to practice medicine in Utica in 1914 He then served overseas in World War I, commissioned in the hospital reinforcement group of the British Army, and was awarded the Military Cross. On his return to Utica, he re-entered practice, and served as secretary to the Oneida County Medical Society for fourteen years and as president for four

The Hale was always an enthusiastic advocate of organized medicine and gave much time and thought to the development of voluntary health insurance plans and the recently inaugurated procedures for the home and local care of veterans of the last war as developed by the Veteran's Bureau He was consulting surgeon at the Utica State Hospital, a former president of the staff of Faxton Hospital, and, for many years surgeon to several railroad companies in this State

Dr Hale long was an active participant in various welfare organizations in Utica. He was a Fellow of the American College of Surgeons, a charter member of the Utica Academy of Medicine, and prominent in the civic life of his community. His comparatively short period of service as Preadent of the State Society disclosed him to be a leader, progressive in thought and action, and it is most unfortunate that his career should have been cut short at such an early age. He was an outstanding person in our ranks, a modest, sincere, friendly, and honorable man. We can only repeat that he will be greatly missed by his colleagues and friends.

A RADIOLOGIST IN THE NAVY

E FORREST MERRILL, MD, New York City

THE writer was commissioned in the United States Naval Reserve in November, 1934, and was ordered to report for active duty on January 5, 1942

This paper may be a rather rambling one as its object is to reveal the various types of duty a naval medical officer may be asked to perform

Many medical officers of the United States Naval Reserve did not have the good fortune of being able to limit themselves to the practice of their specialty, although the Bureau of Medicine and Surgery did make every effort to accomplish that end The writer was extremely fortunate in being able to practice his specialty throughout practically all of his tour of active duty—a little over four years

His date of induction into active service was January 12, 1942, and his first station was in the dispensary at the Navy Yard, New York Up to that time, he had had no previous experience as a naval medical officer and, naturally, a period of indoctrination was necessary Duty at a navy yard dispensary at that time consisted of emergency room work which was not unlike the emergency work in a large mill or factory, (2) medical officer of the day, (3) examination of civilian applicants for employment, (4) routine physical examinations of naval personnel, and (5) occasional ambulance calls within the yard Naturally there was little opportunity for specializing in such a setup, but that duty-station was not to last long, as at the end of three weeks orders for a change of station took this officer to the US Naval Hospital at Newport, Rhode There was much naval activity in that locality as the hospital was only one of many naval institutions, including a large and growing naval training station

The bed capacity of the hospital had been amplified so that most of the physical facilities of the hospital were overtaxed and it was necessary to begin planning for an enlarged x-ray department in order to fulfill the need adequately Changes and additions to the equipment had been recommended before, but no radiologist had remained on duty at the hospital long enough to carry out his specific recommendations. As it was necessary to plan almost a year ahead of actual installation of new equipment, the peacetime apparatus was sorely taxed before the department could be revamped and new equipment.

Presented at the 140th Annual Meeting of the Medical Society of the State of New York, Section on Radiology, May 3, 1946

actually installed. It was not hard to demonstrate the need for enlargement of the x-ray department, including additional darkroom facilities, because, in addition to doing the various types of radiography required in a large general hospital, a large and active outpatient department also sent its quota of ambulatory patients

Additional naval activities which added their share of outpatients for radiographic examination as well as roentgentherapy were the naval operating base, training station, war college, ships at anchor in Narraganset Bay, the torpedo station, the PT base, the Quonset naval air station, construction battalion training, and the distribution center—Dependents of officer and enlisted personnel were also accommodated

In the outpatient department an active and enlarging prenatal clinic soon resulted in an innovation consisting of an arrangement between the medical officers in charge of the outpatient department and the x-ray department whereby the chests of all prospective mothers in the prenatal clinic were studied fluoroscopically and radiographically during the early months of pregnancy, with the result that the expected 1 per cent of unsuspected pulmonary tuberculosis was revealed

Organized radiologic conferences were instituted at weekly intervals, to which all medical officers of the hospital staff and surrounding activities were invited. These were continued as long as space in the x-ray department was adequate to accommodate those desiring to attend, and, then, when the department became crowded with patients at all hours of the day, the conference was incorporated in the weekly meetings of the medical and surgical departments of the hospital, where a larger number of medical officers were reached

The exigencies of the war demanded that certain corpsmen be trained as specialists and the US Naval Hospital at Newport was designated as one of several schools for training corpsmen as specialists, including x-ray technicians. This arrangement meant that we continually had twelve selected corpsmen in training as x-ray technicians, presumably for a period of six months. Most of the corpsmen selected had had no acquaintance with radiography and so their training started with the physical basis of roentgenology, the fundamentals of darkroom technic, then radiographic technic, with actual practice in all branches of technic. The permanent staff of the x-ray department, including one

junior medical officer, aided in this schooling and supervised the practical training Unfortunately, urgent need for men sometimes shortened the training period and at times, practically all of our men, both those in training and those assigned to duty would be removed and sent elsewhere for

This situation always left the x ray department undermanned and meant strenuous days of intensive training of a new group of x ray tech nicians. Under ordinary conditions, a certain complement of hospital corpomen were assigned to regular duty in every department of the hospital but the demands for trained men at new naval stations as well as on ships meant that men could be drafted both by the naval district office and by the Bureau of Personnel in Washington

In order to conserve space in a department which could not be physically enlarged a mobile roentgentherapy unit was installed and by that method one of the rooms was used for diagnostic radiography as well as therapy All roentgentherapy was of the low or moderate voltage variety as this particular naval hospital was not one of those designated by the Burcau of Medicine and Surgery to carry out high voltage roentgentherapy

In August, 1044 orders for change of station were once more received. This time the assignment was to the staff of Special Augmented Hospital Number Three—then beginning to organise at U.S Naval and Distribution Center Shoemaker, California. On arrival at the new duty station, the tentative plan of the proposed hospital was gradually revealed Several hospitals of 200- and 400-bed capacity were being developed and the one to which the writer was to be attached was of 400-bed capacity with enlisted personnel of two hundred and fifty mately one hundred and eighty of these men were to be hospital corpsmen of various ratings and the remainder were to be artificers cooks bakers, mess attendants, and such.

The officer complement was seventeen medical officers, two dental officers, and four officers of the Hospital Corps. Of the seventeen medical officers one (the senior officer) would be the medical officer in command and the next officer in rank would be executive officer The remain ing fifteen would represent various specialties, together with several junior officers to assist in surgery and medicine. The four officers of the Hospital Corps would be administrative officer, supply and accounting officer, maintenance officer, and commissary officer

During our period in the Training and Distribution Center, there was much to be done, because even though the war was then in its third

year, many of the hospital corpsmen assigned to Special Augmented Hospital Number Three for duty had had little or no training in hospital practices. Classes for the teaching of corpsmen were organized and taught by our hospital and medical corps officers. A group of promising corpamen was organized and taken to the US. Naval Hospital at Shoemaker, California, for furtherance of their practical surgical training Sanitation teams were organized and trained by the prospective sanitation officer in the problems of hospital and camp sanitation while other corpsmen were sent on temporary duty to nearby hospitals for psychiatric nursing training

Our training program, however, was hampered in many ways, because our actual supplies were not available for observation and it became evident that we would not see our supplies and equipment until we had reached our destination, presumably on some, then unknown, island tenting was not available—although we finally did avail ourselves of a few tents of various sizes so that we could become proficient in their erection Often our officers and men were assigned to temporary duty at various other stations on account of the need for men but still, by taking advantage of the men and time available, much needed training was accomplished through the planning and cooperation of our medical, dental and hospital corps officers.

The date of departure of the unit for overseas duty was unknown to us, so that the actual length of time that we had for training our personnel was also unknown, but every possible advantage was taken for the benefit of the unit. Most of the medical officers had the opportunity of taking courses in tropical medicine and some were asagned to a practical course in fire-fighting

The writer had been assigned as the roentgen ologist of the hospital, and as time went on it became evident that he would also be the Executive Officer when the unit embarked for duty outside the continental limits—so that his time was spent to a large extent in organizational activities. It happened that the dispensary of the Training and Distribution Center was without a regularly assigned roentgenologist during much of the time that the hospital unit was in training, so that he kept occupied on a volunteer basis along radiologic lines. During this interval, a photofluorographic unit was installed in the medical processing unit of the center and the experience of helping to set up this unit and get it into operation was most instructive and valuable. Every officer and man processed before being sent overseas was photofluorographed and the report was inserted in his health record Suggestive or suspicious findings at the time of the photofluorographic examination were followed by further examinations on 14 by 17 films

On March 10, 1945, the hospital was commissioned with Commander Calvin C Caldwell, (MC)USNR as Medical Officer in Command, and about five weeks later, the enlisted personnel with five officers embarked for overseas duty—the other officers having preceded the major part of the unit by a few days on a second ship. The supplies and equipment were carried on a third ship. Our destination, at the time of embarkation, was secret, but when it became known that the destination was Okinawa, the news put new life into every man, as he felt that at last he was going to be able to do the job he had been preparing for

Our cruise to Okinawa was not fast as several stops were made on the convoy route. No training or class instruction was possible aboard ship due to the crowded conditions and the fact that personnel from many other organizations was aboard. Naturally we travelled under blackout conditions and this made the number of lighted spaces exceedingly limited.

On the first day of June we approached Okinawa and we turned in that night with a feeling of safety, as we had seen five of our carriers—two large and three small—on the horizon at sunset. We knew that our convoy was in their care and that we would be ashore in a short space of time. Two days later, on June 3, we sighted our destination and about 5 30 Pm on that rainy Sunday afternoon over the side we went, combat equipped, to see what the beach had to offer

One hospital was already partly erected at the same site on which Special Augmented Hospital Number Three was to be erected and our first problem was to find that location in the rain and mud

We had reached the beach late in the afternoon and were overjoyed to see some of our officers, who were guarding our stock pile, where our hospital equipment was being dumped. Our next problem was to get our men, who were carrying their gear, out to the camp site. This was finally accomplished by afternoon of the following day, though many of the truck drivers had no idea where our hospital site was located. The recital of the experience of the various truckloads could well be the subject of another narrative.

Transportation of our hospital supplies and equipment was accomplished by the personnel of one of the Construction Battalions, who trucked our materials from our guarded dump on the beach. We located more of our supplies at other beaches and eventually got most of the various pieces of equipment to our dump at the hospital site.

Every man of our organization was more than willing to do whatever he could to help in the planning and erection of the hospital, and there were many problems, which, under the guidance and foresight of a commanding officer who worked with and for his men, were solved. The island was not yet secure and this meant that the hospital compound had to be guarded without any aid from the regular armed forces. The twenty-four hour guard cut down our available manpower, but those men who were left worked all the harder, aiding the Seabees in erection of the tent decks and frames

Mud and roads which were impassable at times hindered the completion of our stock pile, but shortly after July 1 the hospital received its first patients, coming from naval and manne activities in all parts of the island and from ships in the waters around the island

The x-ray department occupied about three fifths of the space in a Quonset hut twenty feet wide and forty-eight feet long, so that we had an area twenty by thirty feet which was divided into a utility room, workroom, office, and darkroom In the workroom were two pieces of diagnostic apparatus, a Picker Army Field Unit incorporated in a table designed for foreign body localization, and a mobile shockproof "tube in head" unit The field unit and table were made serviceable for our purpose by the addition of a plywood This unit was primarily designed for fluoroscopic localization of foreign bodies, but we had practically no need for utilizing it for that procedure, as the island was pronounced secure before the hospital was in operation fluoroscopy than that mentioned above was impracticable with the unit and, as a matter of fact, all the fluoroscopy done was necessarily done after dark because of a scarcity of materials and lack of proper apparatus, such is a lightproof fluoroscopic head hood, which was not sent to us Shortages of essential pieces of apparatus also limited the work of our medical officers in other departments of the hospital

With the aid of the Seabees we were able to connect running water to the tanks containing the insert tanks for the developer and fixing bath, but as we had no refrigerating units to cool the water in these tanks, they were serviceable only during the early part of the day, as our water reached a temperature of 100 F by eleven o'clock in the morning The ice machine helped us out after it was in operation

The humidity did not put our shockproof apparatus out of commission as it did in the South Pacific After properly asembling the field unit and protecting the connections of the shockproof cables with petrolatum, we had no breakdowns

Communications from radiologists in the South Pacific indicate that in order to prevent breaking down of the connections, each unit had to be dissembled at the end of the day. This good fortune was appreciated by us as it was necessary to have the unit in operation during the twenty four hours of each day.

Because of the lack of a fluoroscopic room, practically no gastrointestinal work was attempted, and, as a matter of fact, there were few times when sufficient film was available to under take an adequate study of the gastrointestinal tract. Every patient requiring such a study was evacuated to Guam.

The electric power source for the hospital was a 75-kilowatt Diesel generator and under ordinary conditions the power supply for the x-ray department was drawn from this source. Our emergency source of power was a 15-kilowatt generator located between the Quonset hut housing the surgical operating rooms and the x-ray department. This was called into action on the occasion of failure of the main source of supply, as for in stance, during the typhoons of September 15 and October 7, 1945

Water during the early days of the hospital was hauled from water holes, sometimes five miled distant, in 300-gallon trailers and a 1,300-gallon tank mounted on a truck. Usually it was necessary to haul water night and day, though sometimes at night the sinpers made it too hot for ut to continue. Once the water arrived at camp we ran it through our own purification tanks before storing it in cypress tanks. Later on, the Seabees completed a pipeline from a large water purification plant about a mile away.

As summer progressed, it was evident that some

preparation would have to be made for the protection of our patients in the event that a typhoon hit the island—and here again the foreight of our commanding officer paid good dividends, as he pressed the matter of constructing a typhoon shelter. All of our structures with the exception of three Quonset huts and a galley of similar construction were framed tents with wooden deaks, and we know that they would never stand

up in a storm of typhoon intensity

A survey of available sites for a typhoon shelter
resulted in selecting an enclosure about sixty feet
square that formerly contained a group of build
ings occupied by a native family. The wall of
this enclosure was a combination of coral wall,
dense shrubbery, and an earthen embankment.
Inside this enclosure was erected a timber structure about six feet high, and this was covered
with tarpaulins held in place by bags of earth

Whenever storm warnings indicated that the wind might bring destruction to our tents all bed patients were carried into this shelter. In the typhoon of October 7 and 8, only six of our thirty ward tents remaind standing when the storm was over, yet no patients received any in jury and all necessary treatment was carried out by the medical officers and corpsmen in the typhoon shelter.

Originally, Special Augmented Hospital Number Three should have been taken over by a larger 2,000-bed Fleet Hospital, but the rapid changes during the summer of 1945 resulted in cancellation of that plan, and on October 25 Special Augmented Hospital Number 3 was decommissioned and its patients and personnel were absorbed by Special Augmented Hospital Number Six, and thus ended the story of a good outfit

PUBLIC HEALTH SERVICE APPOINTMENTS AVAILABLE

A competitive examination for appointment in the Regular Corps of the U.S. Public Health Service in the grades of Avsistant Surgeon (1st Lieutenant) and Sculor Assistant Surgeon (Captain) will be held in New York on March 6 at 15 Pine Street, U.S. P.H.S. District No. 1

Regular Corps appointments are permanent in nature and provide opportunities to qualified doctors for a life career in one or more of a large number of fields including research general hospitals, special hospitals foreign duty and federal state, and local public health programs assignments are made with all possible consideration of the officer's demon strated abilities and experience. There is ample opportunity for professional growth and development.

All applicants must be at least 21 years of age, must be citizens of the United States must present

a diploma of graduation from a recognized medical school, and must satisfactorily pass a physical examination performed by Public Health Service officers when directed upon successful completion of the oral and written examination

Applicants for the grade of Assistant Surgeon must have had at least seven years of educational and professional training or experience exclusive of high school.

Applicants for the grade of Sanior Assistant Sur geon must have had at least eleven years of educa tional and professional training or experience, exclusive of high school.

Application forms may be obtained by writing to the Surgeon General, US Public Health Service, Washington 25 D C. These should be retained and presented to the Board at the time the applicant appears for the oral examination.

ACUTE PERFORATION OF PEPTIC ULCER, EARLY AND LATE RESULTS

HENRY A KINGSBURY, M D, New York City, and John A Schilling, M D, Rochester, New York

IN 1930 White and Patterson's reported from the Roosevelt Hospital the late results of 53 cases of perforated peptic ulcers treated by simple suture, and 26 treated by simple suture plus immediate gastroenterostomy. The mortalities were 19 and 26 per cent, respectively. As a result of these studies, simple suture was adopted as the procedure of choice on the combined surgical services of the Hospital. This is a report of our experiences at the Hospital with 224 consecutive cases of perforation occurring in the twelve-year period following the adoption of this method of treatment.

Incidence — Table 1 shows the age distribution of these 224 cases of perforated peptic ulcer Sixteen (7 per cent) of the patients were females This is twice the accepted incidence of fifteen years ago Ten of the perforations occurred between January, 1939, and October, 1943, the years of spreading world conflict It is interesting to note that during the last half of the Nineteenth Century the incidence of peptic ulcer perforations in women was about 50 per cent reached an all-time high of 73 6 per cent in a report from Germany covering the years 1900 to 1910 2 Subsequently, it declined rapidly so that in the several large series recently reported it is generally less than 10 per cent No adequate explanation is offered for the reversal in incidence, and one cannot help but wonder if reports ten years hence will not show a generally higher incidence of this condition in women.

Pathology —In this series there were 207 cases of proved duodenal ulcers, 12 of gastric ulcers, and 3 of marginal ulcers. The anterior superior surface of the duodenum was the most common site of perforation of the duodenal ulcers, and the region of the lesser curvature of the stomach for the gastric ulcers. Multiple perforation was not recognized in any case at operation, but multiple ulceration was found in the duodenum in 4 cases at autopsy

Presented at the 140th Annual Meeting of the Medical Somety of the State of New York, Section on Surgery, May 3,

Diagnosis —In the great majority of cases perforation of a peptic ulcer is relatively easily recognized. The classic, sudden, agonizing abdominal pain and the rigid, board-like abdomen are highly suggestive. The history of indigestion or gastric distress is supporting evidence. One hundred and ninety-four (86.4 per cent.) of this series have such a history, 26 (11.6 per cent.) denied previous gastric complaint, and in 4 cases it was not stated.

The presence of free air under the diaphragm in the upright x-ray or between the liver and ribs in the left lateral recumbent position establishes the diagnosis of a perforated viscus. In this series, 199 patients (88 per cent) were x-rayed and in 103 (52 per cent) there was free air in the pertoneal cavity.

An erroneous diagnosis of appendicitis was made in 7 (3 1 per cent) instances. The McBurney incision was immediately closed and the perforation sutured through a separate incision.

In 2 patients with a preoperative diagnosis of acute cholecystitis, operation revealed a perforation which was sealed off In 3 instances an error in diagnosis was responsible for the death of the patient In 1 patient the presence of a strangulated scrotal hernia obscured the primary pathology, which was not discovered at the opera-The second patient was thought to have an acute pancreatitis Autopsy revealed a perforation on the posterior surface of the second portion of the duodenum and a large retropentoneal abscess The third error was made in a patient with signs, symptoms, and x-ray findings suggesting pyloric obstruction Autopsy revealed a huge dilated stomach, a perforated duodenal ulcer adherent to the gallbladder, and peritonitis confined to the upper half of the abdomen by adhesion of the transverse colon to the anterior abdominal wall

Treatment

Preparation —In all cases in which the diagnosis was made operation was carried out promptly. The preoperative preparation consisted of restoration of fluid balance by the use of plasma, glucose, and saline infusions as indicated in shocked or dehydrated patients. The introduction of the indwelling stomach tube with continuous suction has become a routine procedure. We have not found that the preoperative preparation requires more than one to two hours and have not deliberately delayed operation for longer periods as advocated by Graham. Morphine and atropine are used routinely preoperatively.

Can

Operation was performed under gas-oxygenether anesthesia, with avertin or pentothal occa somally for induction. Spinal anesthesia was not employed.

Incaron.—In 1937 Amendola advocated a subcostal approach for the suture of perforated peptic ulcers. It is our feeling that this subcostal incision offers adequate exposure for simple suture of the perforation, reduces visceral trauma and wound pain and also reduces the likelihood of postoperative hermation, since the deep surface of the wound is shielded against rupture by the presence of the liver. It is a simple matter to prolong this incision into a right rectus incision if additional exposure is required.

One hundred and nine patients in this series were operated upon through a subcostal incision 107 through a right or left rectus, and 3 through

the midline.

Suture—In 206 of the perforations, closure was by means of linen sutures of either the Lembert or purse-string type. In the remainder, catgut was used Follow up studies have falled to reveal any correlation between the type of suture employed or the method of application, and the persistence of syntptoms.

If the induration and friability of the tissues surrounding the perforation were of such degree as to prevent inversion of the perforation a pedical or free omental graft was used to seal the opening as advocated by Roscoe Graham. When closure was possible by inversion alone the suture line was runfored with a small tab of omentum.

In 41 patients, sulfanilamide crystals were placed in the abdominal cavity at operation. Of this group 2 died. One had perforated more than fifteen hours before operation and a drain had been placed down to the ulcer site. Death occurred eighteen hours after operation and autopsy revealed a generalised peritonitis. The second patient had perforated eight hours before operation and following simple suture a drain had been placed in the abdominal wall only. At autopsy ten days later, a chronic perforated duodemal ulcer and generalised peritonitis were found. One of the sutures used to close the perforation had not held

No general rule can be offered concerning the use of sulfanilamide intriperitoneally. The distinction between pentoneal irritation by acid gastric content and an established bacterial pertonitis is often difficult. No conclusions can be drawn from this group of 41 cases since the initial cathusnasm centering around sulfanilamide in the treatment of pentonitis resulted in its being used in some cases which had been perforated for less than two hours and in which the drug probably had not influenced the outcome. However, it may be justifiable to say that the longer the interval

from perforation to operation, the greater the indication for the use of sulfanilamide.

Simple suture was performed in 206 instances. In 1 patient a gastroenterestomy was performed in addition to suture because of narrowing of the lumen of the duodenum. One patient with a perforation of a marginal ulcer was given entero-enterostomy for the same reason. There are 2 partial gastrectomies 1 for perforated carcinoma of the stomach, in the other an un suspected acute perforation of a posterior wall duodenal ulcer was found during gastrectomy for intractable duodenal ulcer

Dramage —Drains were employed in 70 patents, fifty of the drains were placed superficially down to the anterior sheath or through the muscle to the personeum. In 20 instances, the drain was introduced into the personeal cavity because of marked personeal contamination or uncertain closure of the perforation. Two of the latter died as a result of continued leakage with generalized personitis. Although drainage was established in all cases of localized peritonitis with abscess, its efficacy in the presence of a diffuse peritonitis is open to question. None of the patients in whom the personeal cavity was drained developed incisional hernias, although 5 developed wound infections (Table 2)

TABLE 2

Abdominal Cavity Drainage
Perforated best than 12 hours
Saverity of peritoneal reaction
Deaths
Unsattafactory Closure
Deaths (peritonitis)
Perforated more than 12 hours
Sasied perforations and focal peritonitis
Open perforations and diffuse peritonitis
Deaths (peritonitis)

Closure—All wounds were closed with 0 chromic catgut, for all layers, except the skin which was closed with silk or Michel clips. Heavy silk or stainless steel wire relation software were used if a rectus or midline incision had been made. When a McBurney or low rectus incision had been made for drainage of the perts, the peritoneum was closed about the drainage tube and the remainder of the wound packed open with vaseline gause.

Complications — Over one half (112) of the patients operated upon had one or more postoperative complications. As indicated in Table 3, forty-seven were respiratory

The relationship of the type of incision to pulmonary complications is of interest. Amendola felt that patients with a subcostal incision had less wound pain, less inhibition of cough and hence fewer pulmonary complications.

The statistics of this group bear out this complication in the cases complication.

TABLE 8

Duodenal fistula	28
Miscellaneous	28

ated upon through a subcostal incision and 30 through a right rectus incision

Thirty-eight patients developed mild to severe wound infections. In 26 of these cases no drain had been placed in the abdominal wall. Since the great majority of wound infections occurred in the undrained cases, the routine use of a drain down to the peritoneum is recommended. If left in place for at least forty-eight hours, the incidence of this complication should be reduced.

There were 6 cases of wound disruption in this series of wound infections, with 3 patients eviscerating. One of these died of generalized peritonitis. Drainage of the peritoneal cavity had been carried out at the time of suture of the perforation. The other 2 patients with evisceration survived under conservative therapy. One had had drainage of the abdominal wall, and the other had not. Of the 3 cases of wound disruption without evisceration, 2 were subcostal incisions and 1 was a right rectus incision. None of these cases had drainage.

Gastrointestinal hemorrhage occurred in 8 patients postoperatively. One patient died, the remainder surviving with palliative therapy Autopsy revealed the fatal hemorrhage was due to an eroded vessel at the base of the ulcer.

Six of the series developed subphrenic abscesses subsequent to suture of the perforation. Five had been operated upon within twelve hours of the time of perforation, and in only I had drainage of the peritoneal cavity been instituted at the time of operation. In each case the abscess was drained as soon as the diagnosis was made. Four died, either of this complication or of subsequent complications such as perforation of the abscess through the diaphragm with empyema, multiple liver abscesses, and streptococcic septicemia. In none of the fatal cases of subphrenic abscess had there been drainage of the abdominal cavity at the primary operation.

Careful aspiration of escaped gastric or duodenal content from under the diaphragm and both lumbar gutters should aid in reducing the incidence of secondary abscess. If sulfanilamide is used in the abdominal cavity, an attempt should be made to distribute some of it over the superior surface of the liver

Four patients developed postoperative pyloric obstruction while in the Hospital

There were 2 cases of duodenal fistula following operation. One patient died of peritonitis, and autopsy eight days later revealed that a leak had developed at the site of suture. The second fistula occurred in a patient subjected to primary partial gastric resection for perforated carcinoma of the stomach.

There were 4 cases of secondary pelvic abscess One patient died as a result of a pelvic abscess associated with subhepatic and subphrenic abscesses. Two abscesses subsided spontaneously and one required drainage.

The remaining complications are best classified as "miscellaneous" In this group I have placed such complications as auricular fibrillation, cardiac failure, thrombophlebitis, uremia, delenum tremens, mild unexplained temperature rises, and hematomas of the wound

Repeated Perforation—Fourteen patients of the series gave a history of previous perforation Nine were admitted with a second perforation and 2 with a third—In these 11 patients simple suture had been done for the previous perforations—Two had perforation of a marginal ulcer which followed a partial gastrectomy

A review of the literature reveals an increasing incidence of repeated perforation (Cohn, Ross, Estes and Bennett, and Parker) We have had no experience with partial gastrectomy for uncomplicated acute perforation of a peptic ulcer (Judin, and Strauss¹¹) Finsterer believes a partial gastrectomy is indicated three months following closure of a perforation of an ulcer whether or not the patient is symptom free We feel this attitude is too radical However, we do believe that repeated perforation is one of the indications for partial gastrectomy

Mortality—In this series of 224 perforated peptic ulcers, there were thirty deaths, a mortality of 134 per cent. Since two of the fatalities were in patients who refused operation, our operative mortality is 126 per cent. Peritonitis was the chief cause of death in 19 (633 per cent), pneumonia in 3 (10 per cent), subphrenic abscess and cardiac failure, respectively, in 2 (6 per cent), and fatal pulmonary embolus, hemorrhage, multiple intraperitoneal abscesses and liver abscesses, and retroperitoneal abscess in 1 case each (3 per cent). Three of the twelve misdiagnoses terminated fatally (25 per cent) (Table 4)

TABLE 4

0-6	154	8	5 1
6-12 12-18	33	7	21 2 28 5
18-85	12	5	500
26 plus	15	5	38 Q

Approximately 70 per cent of the patients in this series were operated upon within six hours of the onset of symptoms. Of these 154 patients, 8 died, a mortality of 51 per cent for those operated upon during this early period Fifteen or over 50 per cent of the deaths occurred in those operated upon in the twelve-hour period following the onset of symptoms (Table 5)

Autopsy was performed on 6 patients who died even though operated upon within six hours of the onset of symptoms. Two had gastric per foration, one succumbing to a generalized perfonitis and the other to a massive gastric hemorrhage on the fifth postoperative day. Two patients died as a result of inadequate closure of the ulcer. One died as a result of duodenal leakage. The remaining death occurred four months after primary suture, and autopsy revealed a right subphrenic abscess, right purulent pleurisy right interlobar empyema, and a healed duodenal ulcer

Follow-up -- Before beginning a discussion of the follow-up of this series, I would like to em phasize several things First, a follow up which does not cover at least 90 per cent of the survivors of a given procedure does not permit or justify dogmatic conclusions Most reports indicate that a high percentage of patients are not followed for a sufficient time. This report is no exception in that respect. Second, we are slowly accepting the concept that "once an ulcer always an ulcer" An increasing number of patients regarded as cured for periods ranging from five to ten years or more, are returning with evidence of chronic gastroduodenal ulceration. As a corollary to this it would not be out of order to define a cure following a perforation as freedom from clinical or laboratory evidence of peptic ulcaration during a lifetime follow-up. It is extremely doubtful if this ideal will ever be attained Par ker has suggested that these patients be classified as "well" or "unwell." Those whom he classifies as "well" are patients who "consider themselves well free from stomach trouble, able to carry on their usual work with freedom from pain and vomiting, and having to exercise little or no care regarding their diet" With this classification Parker has reviewed the literature and found that approximately 50 per cent would not remain well Fifteen years previously, White and Patterson¹ had believed that 60 to 65 per cent would remain well, and four years after Parker's review, Estes and Bennett' report only 6 per cent well

The follow-up of the 104 survivers of reflections in this series has been instanced. Eighty seven (44.8 per cent) failed to the first tile. Recall Clinic even once. The remains the followed for less than a year and the reflection for more than a year. The reasons for working those followed for less than a year is to be followed for less than a year is to be followed for less than a year is to be followed for less than a year is to be followed for less than a year is to be followed for less than a year is to be followed for less than a year is to be followed for less than a year is to be followed for less than a year is to be followed for less than a year is to be followed for less than a year is to be followed for less than a year is to be followed for less than a year is to be followed for less than a year is to be formation of the followed for less than a year is to be followed for less than a year i

Thirty-ex patients were followed for a perso of less than a year. Of these, 21 (58.3 per cent stated that they had no symptoms and were not following a bland, convalescent ulcer det a put scribed on discharge from the Hospital. The remaining 42 per cent had symptoms of rayin degree. Three (8.8 per cent) had symptoms controlled by diet. Seven (19 4 per cent) had symptoms to me in spite of diet, and 5 (13 9 per cent) has severe enough symptoms to require hospitaliza

tion and further surgery

Seventy-one patients (36 6 per cent) were lob lowed for over a year Twenty three (32.4 per cent) state that they are completely free of symptoms and ar not following a diet. These can be classed as "well" The remaining 48 (68 per crat) must be classified as "unwell." Seven (9.8 per cent) have their symptoms controlled by die Eight (11.2 per cent) have symptoms in space or diet but not severe enough to prevent them to Thirty three (47 per cent) have her working such severe symptoms that readmission to Hospital has been necessary Twelve (1")cent) have responded to medical treatone or more occasions. Twenty-one (29 1 have required further surgery when there medical treatment failed (Table 6)

Summary

1 The early and late results in a recutive patients with perforated pept arms reported

During the last few years there has been a notable increase in the incidence of this condition in females

376

- 3 The diagnosis should be based on the classic symptoms and physical signs Pneumoperitoneum is present in only slightly more than one half of the patients Over 85 per cent give a history suggestive of ulcer
- In approximately 3 per cent an erroneous diagnosis of acute appendicitis or acute cholecystitis was made
- Simple closure of the perforation is the treatment of choice
- Routine drainage of the abdominal wall is Drainage of the peritoneal cavity in the presence of an established diffuse peritonitis us of questionable value
- There is a high incidence of postoperative pulmonary complications and wound infections
- Six and two-tenths per cent of the patients gave a history of one or more previous perforations

- There were thirty deaths in this series, a mortality of 13 4 per cent, with an operative mortality of 12 6 per cent There was a mortality of only 51 per cent in the group operated upor within six hours of onset of symptoms tonitis was the chief cause of death (63 3 per cent)
- The incidence of persistent gastroduodenal ulceration following perforation increases with the length of follow-up

GENERAL CONSIDERATIONS CANCER OF THE PROSTATE

REED M NESBIT, MD, Ann Arbor, Michigan*

(From the Department of Surgery, University of Michigan Medical School, Ann Arbor, Michigan)

ANCER of the prostate gland affects one out of every five men who live fifty years or more, and the high incidence of this malignancy constitutes a matter of grave concern for all physicians who are charged with the responsibility of caring for middle aged or old men We do not know why this neoplasm develops, but its occurrence is thought to depend upon testicular activity—for eunuchs have not been known to develop this disease

Some investigators believe that prostatic develops conjunction with carcinoma ın benign hypertrophy and conclude that the two conditions have a common etiologic back-But the investigations of Moore tend to contradict this viewpoint, for he found that the incidence of prostatic malignancy is as great among men with otherwise normal glands as it is among those afflicted with benign hypertrophy, and Ravisch has shown that Jews display a remarkable immunity to prostatic carcinoma although benign enlargements occur commonly among them

Cancer can arise in any part of the prostate and on rare occasions the entire glandular structure appears to have undergone simultaneous malignant transformation Occasionally, the pathologist recognizes focal areas of epithelial metaplasia that are deeply situated within adenomatous masses that have been enucleated surgically, and he often considers these areas to No one has adequately deterbe malignant mined whether infiltrative growth ever develops from these focal areas, a fact that prompted Eberbach to call them "academic cancers" In the vast majority of the cases prostatic carcinoma begins as a small nodule, situated in the posterior lobe of the gland just beneath the capsule, a fortuitous location that renders the lesion susceptible of early detection by the examining finger The speed with which the neoin the rectum plasm grows and extends into the remainder of the prostate and surrounding structures varies greatly In some instances its local spread occurs with surprising rapidity while in others the tumor Occasionally the develops at a very slow rate malignant process may involve the posterior lobe extensively without spreading into the rest of the gland, McLellan, while serving his residency in

^{*} Presented by invitation at the 140th Annual Meeting of the Medical Society of the State of New York, Section on Urology, in a Symposium on Cancer of the Prostate, May 2, 1946

the University of Michigan Hospital Ann Arbor. enucleated a large adenomatous gland by suprapublic operation. The patient died a few days postoperatively and autopsy disclosed the fact that all of the remaining prostatic tissues were neoplastic, yet subserial sections of the gland that had been removed at operation revealed no microscopic evidence of cancer

Distant metastasis occurs by way of the lympliatics and the blood stream. The commonest sites of early metastases are the lumbosacral vertebrae and the pelvic bones It was formerly believed that the tumor spread to these structures by way of the lymph channels, but Batson in 1940 pointed out that the lymphatic drainage of the prostate gland was not in the direction of these areas. He demonstrated that the venous return of blood from the pelvic organs, particu larly the prostate, often travels in a retrograde direction along the richly communicating palvic and vertebral veins, thus permitting widespread deposition of metastatic cells in the bony structures of this area. The size of the primary neoplasm often bears no relationship to the occurrence or extent of metastases Widespread and extensive metastases are often found in conjunction with a tiny primary cancer, while enormous primary neoplasms may be unaccompanied by any clinical evidences of distant metastases.

The clinical approach to the problem of prostatic cancer is concerned with three essential enterprises prevention of the disease, its cure, and palliative or suppressive treatment when it has fully developed

Prevention of the Disease

In general the prevention of prostatic cancer is not practically feasible, for nothing short of total prostatectomy can today be regarded as an absolute prophylaxis against the disease ever total prostatectomy is recommended for the treatment of many nonmalignant conditions today, and those urologists who routinely perform perineal prostatectomy in the treatment of benign enlargements might logically advocate total prostatectomy whenever the permeal approach is indicated thus adding the benefit of cancer prevention to the other advantages inherent in the permeal operation But, total prostatectomy is invaliably followed by complete sexual impotence and many individuals who suffer from prostatism would be unwilling to exchange their remaining rexual powers for the prevention of cancer if they knew that four out of five persons do not develop the discuse anyway

Cure of the Disease

The cure of prostatic cancer can be accom

plished only by radical perineal prostatectomy that is performed while the primary lesion is sharply localized and every patient found to have an area of induration in the prostate gland should be afforded the benefit of permeal exposure of the prostate so that frozen section biopsy can be performed and early radical removal of the gland carried out if malignancy is present, for only in this way can cure of prostatic cancer be offected Most women today have been edu cated to the importance of periodic examinations of the breasts, but the male population in general is totally ignorant about the dangers of prostatic cancer or of the need for periodic rectal examinations. Most early prostatic cancers are discovered not by urologists, but by the careful examinations made by conscientious practi tioners. The present writer during the year 1945 performed radical permeal operations for cancer upon three men who are employed by a corporation that requires annual examinations of its permanent staff. Let us hope that the day will come when all men are afforded the benefits of this far-seeing corporation in the matter of periodic physical examinations Radical perineal prostatectomy is not a difficult operation to perform and it is also a safe operation. A recent review of the data relating to the patients who have been treated for cancer of the prostate in the University of Michigan Hospital since 1925 reveals the interesting fact that all of the patients who had radical permeal prostatectomy survived operation, all enjoy urinary continence, and all are alive today

377

Palliative Treatment

The palliative or suppressive endocrine treatment of prostatic cancers which cannot be removed by radical surgery commenced in 1941 following the epoch-making discoveries of Charles Huggins who in that year demonstrated a functional relationship between this disease and certain hormones. Since that time physicians have treated patients suffering from carcinoma of the prostate by the administration of estrogenic hormones by irradiation of the testes, and by surgical castration and the series of cases that are being reported currently from many clinics will doubtless provide a means for final evaluation of the methods that are being employed. Spectacular regression of the primary neoplasm has been observed in many of the patients, and in some instances, complete disappearance of metastases has occurred but some of the patients have shown improvement of short dura tion only, and a few have apparently derived no benefit whatever from the endocrine modifications that have been employed Some observers have suggested that carcinogenic activity

in some cases might even be accelerated by the altered hormonal status that is being effected

Evaluation of Endocrine Therapy

It appears evident that a critical evaluation of endocrine therapy must take into consideration not only the spectacular remissions but also the failures, and must demonstrate as well whether the change in hormonal status produces any instances of adverse response. Such a critical evaluation must have control series of cases not treated by the newer methods to serve as a baseline for comparative study. There are few such series reported in the literature and those that are available are lacking in many of the statistical details essential to critical comparative analysis.

My associates and I have recently made a follow-up study on 795 cases of prostatic carcinoma that were diagnosed and treated in the University of Michigan Hospital between the years 1925 and 1940, inclusive

A detailed enumeration of the data on series is being published elsewhere. but some of the data that have a bearing on the present discussion will be presented at this time All but 12 of the 795 patients have been followed by our survey, thus 981/2 per cent of the entire series of cases have provided data that are available to us for statistical enumeration Seven hundred and thirtyseven of the patients have been reported dead 605 died of prostatic cancer, while 60 died following operations and 67 died of other causes—29 of cardiovascular disease Five of the patients died of unknown causes

The average survival of the entire group was twenty-one and two-tenths months, with the extremes less than one month and one hundred and eighty months. The influence of metastases at the time of diagnosis on the periods of survival is of interest. Four hundred and seventy-five of the patients had no evidence of metastases at the time of diagnosis, and the average survival was nearly two years, the extremes being less than one month and one hundred and eighty months (fifteen years)

There were 260 patients who had metastases at the time of diagnosis, the average survival of these patients was seventeen months, the extremes being one month and one hundred and seventy-six months. The patient who had this long survival period had metastases in the spine and pelvis at the time of diagnosis yet he survived nearly fifteen years. It is well to consider these survival data when appraising the longevity following endocrine therapy and, also, when considering the most appropriate time for instituting endocrine therapy.

At the University of Michigan Hospital we

have been following two closed series of cases that are being treated by endocrine therapy and are being followed until the last survivor is gone. One series of 75 patients had surgical castration while the other is composed of 50 patients treated by the oral administration of diethylstilbestrol. The survival data on these groups have been tabulated and compared with data on our control series which are given in Tables 1, 2, and 3

Conclusions

These comparative data indicate that survival rates in cancer of the prostate have been significantly prolonged by endocrine modifications in the series studied

Only a comparison of final data on a closed series of cases will finally disclose how the lon gevity of the greatest survivors in each series will compare, and will settle the question regarding a possible acceleration of neoplastic activity in isolated cases by the modification of hormonal status

THE INTERPRETATION OF PHOSPHATASE FINDINGS IN CARCINOMA OF THE PROSTATE

HELEN QUINCY WOODARD Pri D, New York City

(From the Chemical and the Urological Departments Memorial Hospital)

Since the effectiveness of endocrine treatment of caronoma of the prostate has been demon strated, phosphatase determinations have been used more and more as an aid in diagnosing metastasing prostatic cancer and in evaluating the effects of treatment. As numerous methods are used in measuring phosphatase activity, and as the results are expressed in arbitrary units, the results are likely to be confusing. This confusion may be clarified by a brief review of the proporties of phosphatases, and of the laboratory methods used in measuring them.

Phosphatases are ensymes which split organic phosphates to give free phosphate ion. They occur in many tissues, and differ in properties with the tissue of origin. They fall into two groups according to the pH at which they are most active. The acid phosphatases usually have a broad maximum of activity between pH 4.0 and 5.5, the alkaline phosphatases usually are most active in a narrow range between pH 9.0 and 9.5. The exact proporties depend on the tissue of origin and on the substrate used

Many phosphate esters have been employed in measuring phosphatase activity, but only a few are in common use. Bodansky,1 using sodium beta glycerophosphate as a substrate, developed a method for alkaline phosphatase modified by Woodard's for determinations in the acid range. Results are given in miligrams of phosphorus liberated under standard conditions. The method of King and Armstrong' employs phenyl phosphate as substrate, and results are expressed in milligrams of phenol liberated. The method was originally developed for alkaline phosphatase, and was modified by the Gutmans for acid phosphatase. Recently Huggins reported a method using phenolphthalein phosphate as substrate, results being expressed in milligrams of phenolphthalem liberated Since the relative activities of phosphatases of different origins in various substrates are usually not the same, results expressed in one arbitrary unit can not, in general, be converted by any simple arith metic process into another unit.

Acid phosphatase occurs in many organs, but with the exception of the prostate gland, no organ ordinarily contains more than one to two Bodansky units per gram of tissue In the human adult prostate, the acid phosphatase activity is vory high, reaching several hundred units per gram. The production of this enzyme by the prostate apparently requires androgens for its development, and does not take place until puberty. The acid phosphatase activity of prostate carcinoma tissue is usually of the same order of magnitude as that of the normal prostate although it may be diminished in some very anaplastic carcinomas.

Normal human serum contains small amounts of acid phosphatase. This obviously does not originate in the prostate, since the activities of the sera of normal men are the same as those of the sera of normal women. At present, the source of normal serum and is unknown. In 1938 and 1939 it was shown by the Gutmans, and Robinson. It that the acid phosphatase activities of the sera of many patients with metastasizing carcinoma of the prostate were greatly elevated. This observation was confirmed promptly by other workers.

Because of the importance of this discovery in the diagnosis of prostatic cancer, it at once became necessary to know how often elevations in serum acid phosphatase occurred in the presence of carcinoma of the prostate, and whether they ever occurred in other diseases. The present author has found no elevations above the normal range in the serum acid phosphatase of 34 women and 167 men patients with osteogenic sarcoma, Paget a disease, raundice of various types, plasma cell myeloma, lymphoma, and other diseases not involving the prostate In these determinations sodium beta glycerophosphate was used as substrate The Gutmans and coworkers, using phenyl phosphate as substrate, have found occasional borderline elevations in the serum acid phosphatase of patients with severe bone disease of nonprostatic origin but no marked elevations such as are found in the presence of metastasizing carcinoma of the prostate. Conspicuous elevations in serum acid phosphatase therefore appear to be pathognomonic of metastamzing carci nome of the prostate, especially if the Bodansky method of assay is used

The frequency with which elevations in serum acid phosphatase occur in patients with prostatic disease is shown in the following summary of our findings on 162 patients (Table 1) The Bo-

Presented, by invitation, at the 140th Annual Meeting of the Medical Bodisty of the State of New York Section on Urology in a Symposium on Cancer of the Presiate, May 1 1946.

dansky method was used, and the results are those obtained before the patients had received any endocrine treatment

In 7 of the patients without bone metastases evidence of extension of the disease beyond the prostate was minimal or lacking, and all of these had normal serum acid phosphatase readings. The remainder had local or distant soft part metastases of varying extent.

It appears that the acid phosphatase of cancerous prostatic tissue does not enter the circulation as long as the capsule is intact. It may enter the circulation and be demonstrable in the serum as soon as local invasion or distant metastasis occurs, but does so somewhat more readily when the metastases are in bone than in soft parts. In a few cases (probably not more than 10 per cent) elevations in serum acid phosphatase never occur even in the presence of extensive disseminated disease. In these cases it is possible that the tumor produces little acid phosphatase, but additional autopsy material is necessary to prove this hypothesis.

As shown in Table 1, we have not seen elevations in the serum acid phosphatase of patients with nonmalignant prostatic disease, or in patients with cancer of other origin invading the prostate. It is theoretically possible that an abscess or other ulcerating lesion of the prostate might permit prostatic phosphatase to enter the blood stream, but this evidently occurs rarely, if at all

A large amount of work by many investigators has shown that alkaline phosphatase occurs in the kidney, intestinal mucosa, bones, and some other tissues, but only that alkaline phosphatase from the bones enters the blood stream in significant amounts. Serum alkaline phosphatase is excreted by the liver, and when the liver is diseased alkaline phosphatase excretion may be impaired and the serum level may rise. Production of alkaline phosphatase by bone is increased whenever new bone is being formed, and this increased production results in an increase in the concentration of the enzyme in the circulation. When cancer metastasizes to bone, the bone may

or may not respond to the injury by an increase in the production of alkaline phosphatase, the reason for the difference in response being un-Metastases to bone from carcinoma of the prostate are nearly always osteoplastic Alkaline phosphatase production is increased as an essential part of the new bone formation, and there is a corresponding increase in the amount An elevation in serum alkaline in the serum phosphatase occurs in 90 per cent of patients with bone metastases from carcinoma of the prostate. and sometimes is evident before there are definite symptoms referable to bone In a patient without evidence of liver disease, a rise in serum alkaline phosphatase warrants a very strong suspicion that metastasis to bone has taken place

It should be emphasized that acid and alkaline phosphatases are separate enzymes with different Excess acid phosphatase in the serum comes from cancerous prostatic tissue which communicates freely with the circulation, whether it is invading local organs or is growing in the lungs, in the peripheral lymph nodes, or in the Alkaline phosphatase in the serum comes from the bones In a patient with carcinoma of the prostate metastatic to bone, both the and and the alkaline phosphatase are usually increased in the serum. The acid phosphatase comes from the tumor in the bone, the alkaline phosphatase comes from the bone around the tumor

The changes in the serum acid phosphatase of patients with metastasizing prostatic carcinoma following the institution of endocrine therapy are well known Our observations at Memoral Hospital do not differ materially from those at other institutions, and need only to be sum-When the serum acid phosphatase marized here is initially elevated, it usually exhibits a marked drop within a week after surgical castration, or within two to three weeks after the beginning of stilbestrol therapy Limited experience with estinyl suggests that the effect is similar to that of stilbestrol, although further work will probably show slight differences When the serum acid phosphatase is initially normal, it shows no imme-When an elevated serum acid dirte change phosphatase fails to show a prompt drop follow ing the institution of endocrine therapy, the patient usually experiences no clinical relief, and proves to be refractory to this type of treatment The presence or absence of a prompt acid phosphatase response is thus of considerable prognostic value

When a patient who has shown a drop in serum acid phosphatase with clinical improvement later relapses, the clinical relapse may or may not be accompanied by a significant increase in acid phosphatase. The rise in phosphatase some-

times precedes the return of symptoms by one or two months. When such a rise in serum acid phosphatase occurs, it always indicates a renowal in the activity of the disease Persistence of normal values for the serum acid phosphatase does not however, give any assurance that the duessa is still under control

The absence of a terminal rise in serum acid phosphatase is of considerable theoretic interest. Of 22 of our patients whose serum acid phospha tase was clevated when they were seen first, and who relapsed six months to three years after the beginning of endocrine treatment 12 or more than half, failed to show a terminal rise in serum acid phosphatase to values as high as the initial ones. These patients apparently had a much larger volume of cancerous tissue in their bodies at death than when they first sought treatment, yet the acid phosphatase reaching the blood from this tissue was less. We have also done phospha tase determinations on extracts of prostatic cancer tissue obtained at autopsy from three pa tients who relapsed after an initial favorable response to endocrine treatment The acid phosphatase in these tissues ranged from 5 to 54 units per Gm while the neid phosphatase activity of untreated prostatic cancer is from 100 to 500 units per Gm. when determined by the same method Dr F W Stewart reviewed the slides on these cases and found no unusual histologic features.

These findings make it appear likely that prostatic cancer tissue is so modified by existence in a feminized organism that its ability to produce acid phosphatase is permanently impaired, even though its growth capacity is only inhibited tem porarriy

The serum alkaline phosphatase in patients without bone metastases or liver disease is nor mal, and is not affected by endocrine treatment As stated above in patients with bone metastases from carcinoma of the prostate the serum alkaline phosphatase is almost always elevated a month after surgical castration 80 per cent of these patients show a significant further rise in serum alkaline phosphatase to readings which sometimes reach two to three times the initial In patients who experience sustained clinical improvement, the alkaline phosphatase begins to fall after about three months, and may reach normal as the bone lesions become quiescent When sustained clinical remission is not or heal obtained, the serum alkaline phosphatase usually remains high In patients with bone metastases treated with stilbestrol a rise in serum alkalino phosphatase, shortly after the institution of treatment is seen in only about one third of the cases In the remainder there is either no immediate change or if the clinical response is favorable, a gradual decline toward normal values. There thus appears to be a definite difference in the response of the involved bone to the two types of endocrine treatment.

Summary

The properties of different types of phosphatase are discussed

Conspicuous elevations in serum acid phosphatase appear to be pathognomonic of metastasising carcinoma of the prostate. Normal readings do not exclude this diagnosis.

Evidence derived from acid phosphatase studies on the serum and tissue of patients receiving endocrine treatment indicates that prostatic cancer undergoes a profound biochemical alteration after prolonged existence in the femi nized organism.

In bones which are the site of metastases from prostatic carcinoma, the response to surgical castration appears to differ from that to extrogen therapy

PURE POLIO VIRUS ISOLATED SAYS STANFORD SCIENTISTS

Successful isolation of what they believe to be nearly pure polio virus has been accomplished by two Stanford scientists, Dr Hubert S Loring and Dr C E. Schwerdt, it was announced on January 11 by the University

Laboratory tests, including photographs taken through an electron microscope, indicate that the isolated virus is 80 per cent pure or better according to the two Stanford chemists.

Production of purified virus is seen as an impor

tant step in the long and to date unsuccessful laboratory struggle to produce a vaccine effective against poliomyelitis.

Now that a virus which is relatively pure is available the experimental door is open Dr Loring pointed out, to render the pure virus noninfectious by chemical or physical treatment and, the scientists hope, to produce a concentrated vaccine free of the impurities which have plagued previous polio vaccine experimenters.

PROTEIN NUTRITION IN SURGERY

ROBERT ELMAN, M D, St Louis, Missouri*

(From the Department of Surgery, Washington University School of Medicine, and Barnes Hospital)

THE great attention given to vitamins in the L past few decades has tended to obscure the fact that other elements in the diet, particularly protein, may be of equal and sometimes greater significance The importance of protein has also been minimized by the general belief that the body possesses large stores of protein that are able to meet the needs of an emergency or during periods of deprivation It has been known for nearly a century that protein represents one of the most essential of the nutritional elements in asmuch as it supplies the very protoplasm of living cells, the plasma proteins of the blood as well as the many hormones and enzymes, all of which are proteins and without which vital processes are impossible

Protein has a special significance in surgical patients because of the fact that injury and operation lead to tremendous losses of it and that even the phenomenon of surgical shock is concerned with the lack of sufficient circulating plasma protein to maintain normal fluid relation-In spite of this, the recognition that protein metabolism is important in surgical patients came quite recently Jones and Eaton in 19335 showed the relationship between postoperative edema and protein intake Since then, an increasing number of observations have accumulated, all of which have emphasized the frequency with which protein deficiencies develop after Moreover, the importance of protein operation depletion in many surgical patients requiring operation has been shown to greatly influence operability and mortality, for these reasons it is obvious that unless the surgeon has adequate knowledge of the essential features of protein metabolism and sufficient information of the methods by which the protein deficiencies can be corrected, he will be unable to achieve sufficiently good surgical results following various operative procedures, particularly those involving the alimentary tract

General Considerations

Under normal conditions, protein nutrition is maintained by the intake of an adequate, well-balanced diet, containing among other things, about 1 Gm of protein per kilogram per day in the case of an adult Without an adequate intake of protein the body begins to live upon its

Presented, by invitation, at the 140th Annual Meeting of the Medical Society of the State of New York, Section on Surgery, May 2, 1946 own protein tissue and thus, sooner or late produces many of the now well-known manifestations of nutritional protein deficient

Protein Deficiency of Nutritional Origin—0 of the important features of protein deficien due to an inadequate intake of protein is the fr that all protein tissues in the body begin to was from the very beginning It is true, howev that hepatic protein is probably lost at a great rate for the first few days or until its store is i hausted Thereafter, all protein tissue apparent becomes depleted at an approximately equ rate, the total amount depending upon the dividual mass itself. For example, the to circulating plasma albumin comprises about o thirtieth of the total protein in the body been shown that after protein deprivation (thirtieth of the total amount of protein lost fr the body is represented by the loss of plasi albumin, the rest coming from the other tissi of the body The same relationship seems hold when protein is administered to such a pleted individual For every gram of fo which is used for the restoration of plasma bumin, about 30 Gm are required for replena ment of protein in the rest of the body physiologic concept is of great practical val because it shows how difficult it is to correct depletion in the plasma protein without consid ing the protein needs in the rest of the body

While the deprivation of protein is reflect immediately in the depletion of body proteinsue, clinical manifestations may not be a parent for some time. Perhaps the earlievidence occurs in the liver, as might be expect from the fact that hepatic protein seems selectively depleted early. Evidence has indeed be obtained to show the relationship between pitem intake and hepatic function. Moreover, the effectiveness of protein in protecting the liver against various to ins has been establish just as it has in the case of carbohydrate.

Many other manifestations of protein deprivion have now been observed and rest on fair well-established observations. These inclusions things as loss of appetite, asthenia, at general malaise. More specific manifestation include an increased susceptibility to infection which has been established particularly by the extensive observations of Paul R. Cannon at his coworkers. Failure of wounds to heal, a dominal distension, evidence of intestinal of

stuction have also been shown to follow severe poten deficiency probably because of the prodution of what is now known as nutritional edens.

hatnional or really malnutrational edema is perhaps one of the most striking and serious mani faistons of protein deprivation The etiologic relationship between nutritional edema and a bek of protein intake dates back only to 1922 or about twenty five years, following the original work of Mayer, of Kohman, and of Frisch and Mendel during the 1920's, and confirmed by many other workers since then. Nutritional edoma the to protein deficiency is obvious clinically when it affects the subcutaneous tissues, although the same pathologic changes undoubtedly occur within the body and are responsible for disturbtuces in pulmonary and gastrointestinal function, leading to accumulation of fluid, particularly in the walls of the intestine, in the lumen of the intestine, and even in the peritoneal cavity The tendency toward such an edema is often aggravated by the common practice of injecting

excessive isotonic saline intravenously Hypoproteinemia.—For the study of protein deficiencies, chemical measurements of the plasma proteins of the body is a readily available method of diagnosis However, such measurements must be made with care and interpreted with discrimination. The most common difficulty anses from the fact that patients with definite protein deficiencies may exhibit a normal con centration of total plasma protein. In this way a diagnosis of protein deficiency may be com plately missed On the other hand, a low plasma protein concentration definitely indicates the presence of a protein deficiency There are two reasons why a normal value for total plasma protem may be found in patients with protein deficiencies In one group of cases the blood is dehydrated, or to use another term, hemoconcentrated. This complication is often revealed when, after fluid balance is re-established by an adequate fluid intake, there is a fall in the initial measurements of both the red cell count and of plasma proteins It is important, therefore not to depend upon the initial measurement of plasma proteins as the patient enters the hospital, but rather to repeat the determination several days later or when dehydration has been corrected The second reason a normal value for total proteins may mask a protein deficiency is the frequent development of increases in the globulin fraction in patients with infections, with Hodg kin s disease with lymphogranuloma venereum, etc This is important because it is the albumin fraction which falls during protein starvation so that the low value will be completely missed if the globulin value is high. For example, many

patients will have a total protein of 7 Gm, per cent, which is normal, yet the albumin level may be as low as 2 Gm. per cent, which represents a serious depletion to about half the normal, because the globulin fraction will be 5 Gm. per cent or over twice its normal value. For this reason the diagnosis of hypoproteinemia should always be based upon fractionation of the plasma. Indeed, the term hypoalbuminemia should be used as the designation of protein depletion

The Effect of Surgical Procedures

Injury in general including surgical procedures, and the use of various anesthetic agents, increase the requirement for protein because they lead to abnormal and often large losses. These losses are based upon a variety of mechanisms which may be summarized in the two following categories

Actual loss of protein occurs not only in 1 hemorrhage, but also in wound exudates whenever there is an open defect anywhere on the surface of the body Actual measurements from burned skin surfaces have shown that as much as 50 Gm of protein a day may escape in this way

In addition to such external losses, large amounts of protein are similarly lost as a result of trauma within the body either into the tissue itself or into such body cavities as the pleural or peritoneal cavity, or even into the lumen of the gastrointestinal tract Actual measurements indicate that the equivalent of one to two liters of plasma may leave the circulation in this manner within a period of twenty four hours

Excessive destruction of tissue protein has long been known to occur after trauma of many kinds, as it does during infections and goes by the traditional term of "toxic destruction of tresue protein." More recently, studies have shown that this phenomenon is probably a part of what is called the catabolic phase of injury and is probably associated with hyperactivity of the adrenal cortex one of the hormones of which is known to provoke tiesue protein breakdown The magnitude of this loss of tissue protein may be very great indeed. It is probable that the equivalent of 1,200 Gm. of muscle tissue may be destroyed within twenty four hours during the height of such a catabolic reaction.

It is easy to see how a surgical patient may lose tremendous amounts of tissue protein within a relatively short period if we add the excessive losses mentioned above to the normal requirements, particularly when no attempt is made to meet any of the requirements by an adequate intake, in other words, when protein starvation is imposed upon the excessive losses which nearly always occur to a greater or less extent. If the intake of carbohydrate is inadequate, additional

wastage of protein tissue will occur to supply energy Instead of the normal requirement of about 70 Gm of protein per kilogram per day, the actual needs may easily reach 300 or 400 Gm of protein a day

To say that the administration of this large amount of protein each day would solve the problem is an oversimplification First of all, different kinds of protein are required to meet different needs In the second place, many surgical patients can take nothing by mouth, thus requiring the parenteral route In the third place, a well-balanced diet is often impossible in a sick surgical patient, and, finally, the metabolic response of a surgical patient is not necessarily the same as a normal individual All of these considerations are important in formulating a program aimed at meeting as many of the needs as possible and in preventing many deleterious effects of protein deficiency which occur in surgical patients

Practical Aspects in Therapy

It is obvious that no method for the administration of protein may overlook the need for other elements such as water and electrolyte, carbohydrate and vitamins. The interdependence of protein metabolism to these other elements is so close that consideration of them must be emphasized even though the details cannot be discussed in this short paper.

A second important feature in the practical administration of protein is exemplified by the well-known proverb "an ounce of prevention is worth a pound of cure" In other words, the administration of protein should begin at once Too often surgeons overlook this simple factor at the onset of therapy and awake to the need for protein administration only after serious evidence of deficiencies have developed

In discussing the administration of protein it has been useful to consider two types of requirements

A The need for replacement of acute deficits
B The need for meeting daily requirements

Acute Deficits —Plasma and whole blood transfusions will adequately and promptly correct acute deficits due to the actual loss of whole blood or of plasma either to the outside of the body or into the damaged tissues or body cavities. The surgical conditions which are associated with such losses are fairly well known and include various types of injury hemorrhage, burns, pneumonia, intestinal obstruction, peritonitis, extensive tissue infection, etc. The important point should be emphasized here also that such treatment must be carried out promptly. For example, the replacement of blood loss during the course of an

operation should not await the development of anemia or the clinical manifestations of shock, but should be carried out at once and indeed during the operation itself, and while the loss occurs. A second point concerns the need for using adequate amounts of plasma and whole blood. In most cases at least a liter of whole blood will be needed, although obviously the amount will depend upon the individual case. During the war, for example, after extensive tissue trauma on the battlefield, many liters of whole blood were necessary during the course of operative procedures designed to correct the effects of injury.

The question is often raised as to whether whole blood or plasma should be used. A categorical answer obviously cannot be made. Clearly, if the patient is anemic for any reason, whole blood is preferable and, indeed, red cells alone may be strongly indicated. On the other hand, when the red count is high and the patient has lost only protein-containing fluid, a plasma transfusion is preferable because per unit volume it contains twice as much protein as whole blood. The red cells occupy space and are, of course, essential when needed, but they exert no colloidal osmotic effect and therefore cannot meet protein deficiencies in the circulating plasma.

It should be mentioned, however, that both whole blood and plasma contain a considerable amount of electrolyte. This is due not only to the fact that plasma contains the same amount of sodium chloride as the extracellular fluid, but each liter contains in addition 5 Gm of sodium citrate. Whole blood, of course, contains half as much per unit volume. This is mentioned because in certain cases the added amount of electrolyte may prove deleterious.

Maintenance of Daily Requirements —An important feature of the nutritional care of surgical patients is the probability that much of the caloric requirements may be sacrificed for protem, which greatly simplifies the quantitative problem in that the total bulk of the intake can This we feel is justibe considerably reduced fied whenever the patient has sufficient stores of adipose tissue from which most energy require-On this basis we have set as ments can be met the minimum requirement for an adult 100 Gm of protein and 100 Gm of carbohydrate, and we believe that for a short period of time this will go a long way toward preventing protein deficiencies This basic without physiologic impairment requirement is used whether the patient is able to eat or requires parenteral alimentation.

If the patient is able to take this quantity of food by mouth, the problem of protein administration is simply that of overcoming anorexia and adequate supervision to see that the prescribed

amount of protein is actually ingested. While this is a straightforward problem it is much more difficult than it appears and may require a good deal of time and attention to details It has been our experience that a simplified liquid intake for a few days is of great practical advantage in many patients able and willing to take fluid but not For this purpose we have solid food by mouth devised a high protein drink made by fortifying whole milk with milk proteins so that a liter contains 136 Gm of protein and 1,700 calories Thus, the ingestion of 3 glasses of the drink, each of 8 ounces, will give the patient 100 Gm of protein and 1,200 calories. We have given this mixture to hundreds of patients and have expenenced little or no difficulty as far as taste and convenience are concerned. It has proved a very useful postoperative convalescent drink. It can be ordered just as medication and thus, automatically combats starvation which frequently follows the ordering of the usual types of dieta

Tube Feeding—A patient with a normal gastrointestinal tract who refuses to even drink may require tube feeding. Tube feeding is a planned procedure, of course, in patients with a gastrostomy or jejunostomy. Tube feeding has also been used after operation, during which the surgeon introduces a nasal catheter across the gastrointestinal anastomosis into the jejunum, for feeding purposes. Obviously all protein adminiered in this way must be in the form of liquids any mixtures for tube feeding have been desed

In many cases, the employment of a protein drolyate rather than whole protein offers ratin advantages. The use of such hydroly ites spares the need for protein digestion and in riain cases will effectively combat diarrheabich may follow the use of whole protein. A scond practical advantage is the fact that much ore protein nourishment can often be given in as form of hydrolyzed protein than is possible ith whole protein.

Parenteral Protein Feeding—Many patients an take no food by mouth for one of many reaons, so that all nourishment must be given hrough the parenteral channel. This is true aost commonly after abdominal operations. Procin may be given either as a whole blood or Masma transfusion or in the form of an amino end mixture. The latter is now generally available as a solution of hydrolyxed protein. Much sunknown of the metabolic fate of whole protein njected as plasma or whole blood as a source of protein nourishment. Nevertheless, ample clinical expenence has demonstrated the value of this form of protein administration in mal nourished patients suffering protein deficiency

As the sole source of parenteral protein feeding it has proved disappointing, fortunately it is now no longer necessary to rely entirely on transfusion in view of the availability of hydrolyzed protein which is a more physiologic, convenient, and inexpensive source of nitrogenous nourishment.

The use of appropriate solutions of hydrolyzed protein is now well beyond its experimental stage and has been extensively used in many thousands of patients. The author employs such a solution in conjunction with glucose in an almost complete regimen of parenteral alimentation. This is carried out as a routine in all patients, before or after operation, as long as they are unable to take protein nourishment by mouth cases two liters are given, one in the morning, one in the afternoon Each liter contains 50 Gm. of glucose, 50 Gm. of hydrolyzed protein (Amigen), and about 2 Gm. of sodium chloride In this way the daily requirements for water. glucose protein, and salt are met. Separately, adequate vitamins are injected. In addition whole blood, plasma, or supplementary saline solution is injected whenever deficits in red cells. plasma protein, or sodium chloride develop

Such a parenteral alimentation regimen has proved so much more effective than the usual in jections of glucose and saline alone that restoration to normal function has occurred much more rapidly. Thus the inclusion of protein has served to shorten the period usually required for parenteral injections. In most cases the patient is able to resume a normal, oral intake within a day or two after operation. Even in gastric resections all patients by one week after operation have been taking an almost full diet by mouth.

The inclusion of protein in the parenteral fluids has also improved convalescence by leading to an early restoration of physical well being, and by permitting an earlier termination of bed rest. We have also been impressed by the absence of impaired motility or obstruction at the gastrointestinal stoma following gastric resection or gastroenterostomy in patients given adequate protein before and immediately after operation. We have made no attempt to achieve positive nitrogen balance, but have observed a great decrease in the usual loss of nitrogen in cases given hydrolyzed protein For example, with the routine mentioned above in which the patient received 12 Gm of nitrogen a day the average negative balance in seventy-six postoperative days (all severe abdominal operations) was but 3 6 Gm, with the usual regimen of glucose only, the lose is usually 10 to 20 Gm a day Finally. we have found that at discharge these patients had lost very little if any weight, and an increase rather than a decrease in the level of serum al

TABLE 1 —Intravenous Amigen Injections January 1 to October 1, 1945

Total amount given		2,729 liters
Total number of patients		352
Average amount per patient		8 liters
Largest amount given one patie	ent	53 liters
Largest amount given one patie	ent in short	est time
		44 liters in 23 days
Total number of untoward re	actions	44 liters in 23 days
Pyrogenic		12 (54 per cent)
Allergic		6 (27 per cent)

THE THIRD AMERICAN CONGRESS ON OBSTETRICS AND GYNECOLOGY

The Third American Congress on Obstetrics and Gynecology will be held from September 8-12, 1947, in the Municipal Auditorium in St. Louis, Missouri Dr Fred L Adair, of Chicago, is the general chair-

While the Third Congress is similar in scope and program to the two previous meetings, it will be larger in every way The program under the direction of Dr William F Mengert, of Dallas, is being made up to appeal to the obstetric and gynecologic specialist, to the general practitioner interested in those fields, to the hospital administrator and to nurses

program will include sections for the public health doctor and the public health nurse The medical section of the program is under the direction of Dr Ralph A Reis, of Chicago, as in

The scientific exhibits are under the guidance of Dr Jean Paul Pratt, of Henry Ford Hospital The moving picture program is being made up by Dr John Park, of Washington, D C Dr John Rock, of Boston, heads the Committee on Evening Speakers The technical exhibit has been arranged by Dr

Philip F Williams, of Philadelphia A membership committee in every state and in the territories is being set up by Dr Ralph E Campbell, of Madison, Wisconsin, and plans are underway to have a special committee build up interest in the Congress in Central and South America Dr Harvey B Matthews, of Brooklyn, heads the committee in charge of publicity The General Advisory Committee is in charge of Dr Howard C Taylor, Jr The Local Organization Committee in St Louis is headed by

Dr Richard Paddock.

The Friday morning sessions of the Congress,
September 12, are to be given over entirely to the
National Federation of Obstetric-Gynecologic socie-The program for these sessions will be arranged by a committee working under Dr James S Taylor, of Altoona One member of this committee, Dr E Lee Dorsett, of St Louis, will arrange an evening speaker for the Federation of nation-wide prominence who will present his viewpoints to a joint meeting of the Congress, the Federation, and the general public For further information address Keyl S. Parlander Karl S Richardson, 24 West Ohio Street, Chicago, Illinois

CONFERENCES ON THERAPY

DEPARTMENTS OF PHARMACOLOGY AND MEDICINE, CORNELL UNIVERSITY MEDICAL COLLEGE AND THE NEW YORK HOSPITAL

THESE are stonographic reports of conferences by the members of the Departments of Pharmacology and of Medicine of Cornell University Medical College and New York Hospital, with collaboration of other departments and institutions. The questions and discussions involve participation by members of the staff of the college and hospital, students, and vintors. A selected group of these conferences is published in an annual volume, Cornell Conferences on Therapy by the Macmillan Company

The second part of this conference will appear in the March 1 issue.

The Rational Use of Cathartic Agents, Part I

Dr. David P Barr Today we shall discuss the use of cathartics from the point of view of rational therapeutics

When I started work in medicine we used ca thartics liberally, and it was the custom in Bellevue Hospital, when I first entered it, to give to every new patient who was not moribund a "three-by-ten," or 3 grams of calomel and 10 grains of sodium bicarbonate. To the alcoholics we gave a "five-by fifteen," which was 5 grains of calomel and 15 grains of sodium bicarbonate The entire range of cathartics was at our disposal. from the mild glycyrrhiza to the powerful oleum tiglii The first gross error which I made in the use of these drugs was in confusing the doses of glycyrrhiza and jalap The difference in dose was only eight-fold, but the difference in effect was extraordinary We learned at that time that there was such a thing as the abuse of ca thartics, and this thought has so thoroughly infil trated the minds of physicians that some have almost forgotten that there is a use for these agents.

Dr Travell will open the discussion today DR. JANET TRAVELL I think that the medical profession may appreciate the abuses of cathartics more than the public does If one judges from the advertisements, these compounds are more widely used than any other class of pharma cologic agents In spite of this, the answers are lacking to a great many questions of therapeutic importance, questions relating to potency and dosage and to the matter of tolerance example, we do not actually know whether there are any cathartics to which tolerance does not develop One sees the patient who has been taking a nightly dose of cascara or aloe for years and years, and we assume that tolerance has not developed since a normal evacuation occurs every day However, occasionally we find that if a placebo is substituted for the nightly cathartic,

the patient gets along just as well as if the cathartic were given. In other words, two things seem to have happened simultaneously tolerance has developed, and the need for a cathartic has disappeared. A great deal of work remains to be done in regard to the matter of tolerance.

There is hope that progress will be made in studying potency of cathartic agents by means of newer technics which were not montioned in our previous conference on cathartics* held about five years ago The first obstacle to the study of potency of eatharties is the wide species variation in the responses to these agents. In a cat weighing 3 Kg, for instance, a teaspoonful dose of phenolphthalein does not cause defecation, whereas in a 70-Kg man, 1/100 of this amount produces vigorous purgation The cathartic action of phenolphthalein in human beings was as a matter of fact, discovered accidentally after its pharmacology had been studied in animals. It was added to wines as a coloring agent, and the effects were rather surprising. It has been clearly demonstrated that the cat, dog, and the rodents are not reliable test objects for studying the potency of cathartics so far as the application of these results to man is concerned. A second obstacle to the study of catharties is the wide variation in the responses of different individuals of the same species, and even of the same individual at different times For instance in the monkey the average threshold laxative dose in one animal may be twenty-five times what it is in another

Dr Loewe has developed a form of bioassay which has surmounted many of these difficulties. The assay is carried out in the Rhesus monkey which, he has shown, behaves qualitatively and quantitatively toward cathartics very much like man. By means of a standard technic, a number of monkeys are calibrated against a standard cathartic, and then varying doses of the unknown cathartic are given and their effects compared with that of the standard. It is necessary to use

Management of Constitution New York State J Med., 41: 1989 (Oct. 1) 1941.

a sufficient number of animals to make the results statistically sound, and also to select a suitable endpoint. Only monkeys are used which have a hard or constipated stool, since the index of the effect is the change in the consistency of the stool from a solid to a watery evacuation. The principles of the method are essentially the same as for USP methods of bioassay.

The final answers regarding potency and dosage of cathartics must, of course, be obtained directly on human beings, just as in the case in the digitalis materials, and it is only recently that such systematic studies of laxatives have been undertaken. Either the normal or the constipated patient will serve, as long as a suitable effect is measured. For example, Dr. Gold has used the constipated patient for comparing the cathartic action of fumerates and tartrates, and Gray and Tainter have compared various gums in the normal individual

Obviously, poisoning by cathartics is relatively infrequent in view of the large number of doses taken. However, one must remember that harmful effects and disagreeable side actions may occur not only as the result of changes in the physiologic reflexes of the gut due to cathartic addiction, but also to drug action in the usual A number of examples of such deleterious effects of laxatives may be cited Liquid petrolatum may impair nutrition by interfering with the utilization of fat-soluble vitamins leak from the rectum carrying carotene with it and stain the clothing It may delay the healing of rectal wounds by forming a dirty layer of fecal matter and petrolatum which adheres to It is apt to convert the rectum into the mucosa a reservoir for fecal material by allowing leakage from the sigmoid colon into the rectum and thus do away with the stimulus to evacuation which follows the mass movement of material from the colon into the rectum It has been demonstrated in animals that liquid petrolatum is absorbed from the gastrointestinal tract and is deposited

Phenolphthalem has been reported as causing a variety of toxic effects including skin eruptions and renal irritation. Dr. Loewe has had special experience in the use of phenolphthalem and I should like to leave this topic for him to discuss. However, I should like to point out that hypersensitivity to the cathartic action of this drug may be encountered so that excessive purgation after an ordinary therapeutic dose may be observed, with sequelae amounting almost to collapse. Even in the average person, the ordinary dose of phenolphthalem often has prolonged effects which extend over two or three days.

The magnesium salts undergo considerable absorption and may cause a rise in the blood level

of magnesium, especially if the excretion of this ion is restricted owing to renal damage. If given in hypertonic solution they may cause vomiting. The saline laxatives should therefore be given in isotonic solution. In the case of the USP salt of magnesium sulfate, a 4 per cent solution is approximately isotonic. In considering the salines, perhaps it should be mentioned that the tartrates have been shown to exert a nephrotoxic action in animals.

Griping, or cramps, may present a problem in the use of cathartics This disagreeable side action is supposed to be counteracted in the case of cascara by the other ingredients of the familiar AB and S pill, aloe is given to stimulate intestinal motility, belladonna is given as an antispasmodic, and strychnine is included for its "tonic" effects on the gut Pharmacologically such preparations are ridiculous The anthracene compounds are excreted in the milk and may cause diarrhea in the nursing infant mel may give rise to mercury poisoning strongly irritant cathartic drugs may cause extreme violent irritation of the bowel and abortion

If one takes into consideration all of these dangers and difficulties, what does one do if one must give a cathartic to relieve constipation? In acute constipation, the cathartic of choice is the suitable dose of any one which will produce a prompt and complete evacuation without excessive purgation A watery stool is usually desirable under these conditions Magnesium sulfate or magnesium hydroxide (milk of magnesia) are usually preferred. At times, the use of an enema is often more rational than a cathartic, if the trouble lies in the lower end of the intestinal tract In chronic constipation, the choice is again the appropriate dose of any one which will regularly produce a soft, formed stool rather than a watery evacuation The gums seem to be the most satisfactory agents for this purpose Cascara, senna, sodium phosphate (the disodium salt), and milk of magnesia are also frequently used over long periods of time Owing to the ready adaptation of the bowel to new stimuli, it is often necessary to alternate one cathartic with another, and, therefore, several cathartics should be included in your therapeutic armamentarium

DR BARR Dr Heffner will continue the discussion

DR REID R HEFFNER At the previous conference we discussed the indications for and the actions of a number of the well-known cathartics, but our remarks about the so-called bulk producers were confined largely to agar Since these bulk producers, or colloid laxatives, occupy an important place in the treatment of constipation, we shall discuss their action in some detail Fortunately, during the past few years several studies

have been carried out in animals and in humans which shed light on the choice of a bulk producer

In this hospital we used to prescribe agar frequently in the treatment of chronic constipation without much thought about its merits as compared with some of the other colloids. Now, with changed world conditions and agar difficult to obtain, we have been forced to prescribe some of the other members of this group. In our experience most of them are superior to agar and that opinion is in line with the experimental evidence.

A number of colloid laxatives, or gums are available for clinical use under a variety of trade names. Gray and Tainter in 1941 made a useful classification of these substances In one group is colloidal clay from which a commercial prod uct, elkonite is obtained I believe that this is not available for commercial use. In the next group is agar As you know, agar is a mucilaginous substance which comes from sea algae which are found along the eastern coast of Asia. It was introduced by Schmidt as a laxative in 1905 Its action is not essentially different from that of other gums. Next are the mucilages, derived from kelp, which exert the same type of action as agar and which are typified by the commercial product, Kelgin Acacia acts likewise, but is not used much for its laxative effect. The members of the tragacanth group are closely related to gum acacia However, the powdered form differs from acacia in that it swells readily in cold water Tragaconth contains about 10 per cent of gum arabin or tragacanthin, together with about 60 per cent of the insoluble gum bassorin Bassorin swells to a large bulk in water In the same group are the karaya and bassora gums, which consist mainly of bassorin. These gums differ from the true mucilages in that they swell up as large granules rather than as a soft mucilaginous mass. These tragacanth granules do not tend to stick in the teeth and can be easily swallowed if washed down with water The plantago gums or psyllium seed preparations have been used as laxatives in the Orient for over a thousand years. This group is said to supply roughage and promote peristalias through mechanical irritation Several proprietary prepa rations are available for clinical use, among which are mucilose, metamucil serutan, and siblin

Bastedo summarises the experiments on the relative hydrophilic potency of the gums as follows. When the degree of swelling of flaked agar in water was taken as 1, granulated agar was 25/2, whole psyllium seeds 10, hulled psyllium seeds 14 and bassorin 29

From the experiments in animals and in humans as carried out by Parsons, Ivy and Isaacs, and Gray and Tainter, it seems that the traga canth group of colloids passes through the intestine unchanged and owes its laxative properties to its marked ability to imbibe water Although processed psyllium products possess this colloidal power to a lesser degree, they are, in addition, partially broken down to irritating end products which are incompletely absorbed and do not in crease significantly the dry weight of the stools. These irritant substances, however, do increase the water content of the stool as a result of the more rapid passage of material through the intestinal tract

When a colioid larative is prescribed, large quantities of water should be taken in order to prevent impaction. These agents should be used with caution in the aged and in debilitated patients. There are a number of reports of impaction at various sites, ranging from the esoph agus down to the rectum, after administration of psyllium seeds and other gums.

Sensitivity to karaya gum has been reported. The manifestations may be hay fever, asthma, dermatitis, or gastrointestinal distress.

In stubborn cases of constipation, the addition to the gum of small amounts of other laxutives, such as cascara, is frequently prescribed for a short time. Several of the commercial tragacanth granule preparations are reinforced with cascara, such as karajel and mucara. A bedtime dose of the emulsion of liquid petrolatum may enhance the action of the gum. Liquid petrolatum (60 to 90 cc.) as a retention enema at night is often used for short periods in obstinate cases.

We all know that dried and fresh fruits, as well as cooked fruits, are helpful not only in mild cases but as an adjuvant in stubborn cases of constipation. Their action depends upon two principles. The first is that the unabsorbable carbohydrute exerts a certain amount of exmotic pressure and thus increases bulk by retaining water. The second is that the indigestible residue, or roughage if you like, produces mechanical irritation of the intestine and thus stimulates mothly directly.

There is no good experimental evidence to warrant the routine addition of vitamin B₁ to any laxative preparation. It is true that the intestine is supposed to be atonic in thiamin deficiency, but in the ordinary case of constipation without avitaminosis, thiamin is not helpful. Dr. Loewe has been interested in the effect of this vitamin on intestinal motility and can give us first-hand information about his experiments

DR BARR Dr Loewe, you have been quoted this afternoon, and we should like to hear from you.

Dr. S Loewe In our experiments in the monkey, vitamin B, showed no capacity for increasing the laxative effect of phenolphthalon find such drug combination accordingly showed no promise for the treatment of constipation

I would like to discuss the problem of constipation as illustrated by other observations in The first point is that the administration of a laxative may result in constipation With the aid of continuous daily stool records, I studied the incidence of stool-free days in more than 300 monkeys during a period representing one hundred and eighteen years of monkey life Originally this study was undertaken in the search for constipated monkeys to serve as test objects for assaying the potency of laxatives found that spontaneous constipation is extremely rare in monkeys, and that such attacks of constipation as do occur almost never last longer than one day. In these one hundred and eighteen years of monkey life, only 2 per cent of the days showed an absence of stool, and it is interesting that 86 per cent of these constipation-days occurred after the administration of a laxative, that is, as the aftermath of the laxative effect phenomenon was discussed in one of these conferences a few years ago, when Dr Martin showed by x-rays in patients that after vigorous catharsis the lower intestine is empty These observations both in the monkey and in man may be explained as a consequence of emptying the bowel of fecal material

Only the Rhesus monkey gives a response to laxatives which is qualitatively and quantitatively comparable to the effect of these agents in man. When the purgative potencies of a series of drugs in the monkey were compared with the anticonstipating potencies of these same drugs in patients, the sequence of potencies was the same in the monkey and in man. To determine such a parallelism is an essential requirement, but often neglected, for a bioassay method

Many attempts have been made to test laxatives in species other than the monkey instance, some investigators observed that in a transparent water flea the entire intestinal tract and its motility are visible, and, hence, concluded that this must be an excellent test object for laxa-They did not take into account the enormous species differences in the physiology and pharmacology of the intestinal tract, which distinguish all species of animals, cats, and dogs, as well as water fleas, from man The Rhesus monkey, so far, seems to be the only exception to Another example of madequate biothis rule assay is the recent use of guinea pigs for testing anthragumones, as they were formerly tested in In both instances, the results were unhesitantly considered to apply to the therapeutic action of these drugs in man When we compared these results with those obtained in the monkey, it turned out that some of the anthraquinones which were strongly active in guinea pigs or in cats, were ineffective or poorly effective in our experiments in monkeys, and vice versa. Those which I found effective in the monkey were those which are, for the most part, used in human therapy

Our experience was similar when we tried to reproduce in the monkey the classic work which Abel and Rowntree did on phthaleins in dogs. They found, for instance, that phenoltetrachlorphthalein was about as potent as phenolphthalein in the dog, whereas I found it without any laxative effect in the monkey, it has since also been shown to be ineffective in man. Also, thymolphthalein and isophenolphthalein, which on the basis of tests in other species of animals were suggested as laxatives, in our monkey experiments were disclosed to be virtually ineffective

As for the mechanism of lavative action, one can only speak of makeshift explanations at the present time One of the makeshifts in this respect is to consider such phenol derivatives as anthraqumone and phenolphthalem as phenols, and to attribute to them the local irritant properties of phenol itself In fact, none of the laxative phthalems, which I know, has any demonstrable local irritant action Even undiluted phenolphthalem when powdered into the eye does not cause local irritation. When injected subcutaneously in gram doses in a rabbit, there follows no local reaction, it behaves like an entirely mert deposit of foreign material The reason for this makeshift theory of purgation by local irritation is. of course, that there is no obvious other explanation Certainly, the mechanism of the laxative action of the phthaleins is not a simple one that can be disclosed by a motor response of a surviving intestinal strip to added phenolphthalein

From an entirely different approach I recently studied the one chemical reaction which is characteristic of both the anthraquinones and the phenolphthaleins Both have an oxygen group, ketonic or lactonic, which can be replaced by the nitrogen of ammonia or of primary amines, resulting in the formation of imido derivatives tendency of the various phthaleins to form imido derivatives interested me as a possible basis of detoxification of phthaleins in the body, since there are so many amino groups available in every biologic substratum The results of measurements of the "imido-affinity" of a series of different hydroxy-diphenylphthalides performed with Hubacher, Doernberg, and Horner were entirely unexpected Phthalein number 1, for instance, in arbitrary but comparable figures, had a laxative potency of 0 3 and an imide affinity of about 4, number 2 had a potency of 0 68 and an

affinity of 21, number 3 had a potency of 10 and an affinity of 34, and number 4 had a potency of 163 and an affinity of 52

If a chemical reaction of this kind plays a role in detoxifying phthaleins in the body, the affini ties should be reciprocal to the potencies stead, there is a clear-cut parallelism between laxative potency and imide affinity gests that imide formation by reaction with some primary amine of the tissues may represent an important link in the mechanism of laxative action of these drugs This concept is far from being proved conclusively But I believe that it is a stimulating hypothesis because it brings the trend of ideas away from existing makeshift con cepts and draws attention to the possibility that a specific reaction between the drug and some body component may be the basis of the mechanism of action It would explain the enormous species differences in sensitivity, and it would bring the action of two groups of phenol laxatives, phthaleins, and anthraquinones under one and the same mechanism

Such an hypothesis would also do away with the particularly vague idea that being irritant phenois the phthaleins should be considered toxic, whereas in reality they appear to be particularly harmless. This latter fact may be stressed because the assumption again has been aired repeatedly that phenolphthalein is toxic to the kidney I believe this assumption is based on the assumption of local irritant properties If phenolphthalein were a local irritant, then it might indeed irritate the kidney if it were to appear unchanged at this site of excretion cause of this trend of ideas, whenever kidney damage coincides with the use of phenolphthalein, there is a great tendency to assume a causal relationship I have been eager to see somebody take the buil by the horns and try phenolphthal ein in individuals with kidney injury course, a deliberate experiment of this kind is not possible. But when kidney function was studied after a thousand doses of phenolphthalein given to patients as well as to healthy individuals there was no indication of kidney injury by phenol phthalein On the contrary in a number of indi viduals in the group who had a disturbance of kidney function prior to the dose, the existing albuminuria was found to be less after phenol phthalein than before

DR. BARR The meeting is now open for com ments and questions

Dr. Charles H. Wheeler I would like to ask Dr Heffner how one decides between something like cascara and one of the bulk forming gums in the treatment of a particular patient.

Dr. HEFFER I cannot answer that specifically One has to use the trial and error method

If possible, we like to get away from the so-called habit-forming laxatives, if there are such things.

Dr. BARR Are there not?

Dr. HEFFNER Perhaps, in some cases, but there is debate whether a tolerance to cascara can be built up or not.

Our procedure is usually to try first one of the bulk producers, adding large quantities of fluid plus other details of the general management. Then, if necessary, we give one of the stronger cathartics, such as cascara, milk of magnesia, or one of the phosphates Not that it does any harm to the bowel to use the stronger laxatives, but the patient usually objects more to taking one of those laxatives than he does to taking a bulk producer Also, we must be guided in our choice of a laxative by the way the individual tolerates the preparation

DR BARR I should like to ask a very practical question. On the cathartic rounds of my intern days I had approximately 30 different products and preparations from which to choose was very confusing, because it seemed that it might take a lifetime to master the knowledge of the cathartics available. I am wondering, Dr. Travell, if you could give us any idea of how many of these preparations you feel are at all necessary

in the practice of medicine today

Dr. Travell I think that there are relatively You might include in your inventory one or two of the gums with which you are familiar, magnesium sulfate, milk of magnesia, and disodium phosphate, as representatives of the saline cathartics, cascara in the form of tablets and the fluid extract, compound powder of senna for those who prefer it to cascara, and, possibly, castor oil in selected cases That is probably all that you really need. You might add phenolphthalein if you like but I do not prescribe it.

Dr. Wheeler No mineral oil?

DR TRAVELL I think mineral oil is not essen The present trend is to do without mineral oil for many reasons. But if you must use it, you will probably obtain a better laxative effect by using an emulsion of liquid petrolatum rather than plain liquid petrolatum. It has been shown that the emulsion is more miscible with the or game matter in the stool. The United States Pharmacopana emulsion of liquid petrolatum is an extremely palatable preparation which is not reinforced with one of the irritant cathartics.

DR McKEEN CATTELL. Why did you name more than one saline cathartic?

Dr. Travell Largely because of the matter of preference by the patient One patient may object to the taste of epsom salts and another to the taste of milk of magnesia. Disodium phosphate in average doses is nt as pregomin thartic as the m

produces a soft and formed, rather than a watery, evacuation, and probably has a certain place in the treatment of chronic intestinal stasis

DR CATTELL Is that difference in effect not a matter of dosage?

DR TRAVELL Yes, probably it is a matter of dosage, but that is so fixed by tradition that it seems to be easier to vary the drug than the dose, and there is still the problem of palatability

DR HARRY GOLD At this point, I should like to say a few words about the choice of cathartic agents, and the reason for their choice Generally speaking. I believe that the patient who is in need of a frequent or even daily cathartic because of chronic constipation will do best to take one of the emodin agents, namely, cascara, senna, rhubarb, or aloe He takes the dose at night and he is likely to have a bowel movement in the morn-The reason for using it this way is that it takes six or more hours for the material to reach its site of action and for the elaboration of the active principle, and if he has taken it during the day, it is possible that its effect might awaken him at night I do not believe there are any persons whose bowels cannot be made to move by this group of agents provided the dose is large Therefore, if one starts with any one of them, it would be unwise to abandon it for lack of action until one has explored a reasonable range of dosage The reason for having more than one of these emodin cathartics at one's disposal is that these resins are mixtures of varying composition, some containing more tannin and other principles, which contribute to a favorable or unfavorable result in some patients are some patients in whom one of these drugs either produces no effect or, when the dose is increased sufficiently to produce an evacuation, gives rise to abdominal cramps With another member of the group, it is often possible to widen the margin between the laxative action and the griping action, so that when this unfavorable situation is encountered with, let us say, cascara, one might explore the possibilities of using aloe I think we should never forget that all laxative agents may produce griping if the doses are too large, and that the first step in the escape from griping is not to shift to another preparation, but to attempt to adjust the dosage of the preparation which is being used

In regard to the saline cathartics, while they can be used for the same type of condition as the emodin cathartics, they are particularly applicable to a special type of constipation problem. They are especially useful for the patient whose bowel movements seem to follow the law of diminishing returns, who finds himself at the end of a week with inadequate evacuation and a sense of general discomfort which, in his experience, is

relieved by a satisfactory "cleaning out" discovers this discomfort when he arises in the The emodin cathartic is not suitable morning for this problem because it takes too long to act Such a patient does better by taking a saline cathartic which produces a response very quickly. much like the response to an enema, in somewhere between one-half hour to an hour or two, if an adequate dose has been taken and with sufficient water to make an isotonic solution know why we continue to use epsom salts or glauber salts, which have a perfectly awful taste, when disodium phosphate is very pleasant to take, and if the dose is large enough, produces an equally satisfactory response I would recommend the most palatable preparation of this salt containing also some tartrate and citrate, namely, the effervescent sodium phosphate USP dose of 15 Gm or 6 teaspoonfuls of the granules dissolved in a glass of water, followed by another glass of water is extremely effective The patient should learn how much he needs by reducing or I doubt very much that increasing that dose there is need for any more than this one saline ca-What we do need is greater attention to the adjustment of the dose to the need of the individual case The problem here is the same as that for so many other drugs, we spend more time shifting from one preparation to another than we do solving a more basic problem, determining the needs for the individual case

There is one point about mineral oil which has not been mentioned, namely, the problem of the individual with a mild form of constipation in whom the chief problem is spasm of the rectal sphincter with or without sore hemorrhoids or fissure. There is no cathartic agent which quite fills the needs in such a case so well as appropriate doses of mineral oil.

A' word about magnesium sulfate I do not believe it is generally realized that as much as about 40 per cent of a dose of magnesium sulfate used as a purgative is absorbed This produces a negligible rise in the blood magnesium in normal persons because it is so rapidly excreted Hirschfelder published a study in 1934 in which he showed that in patients with nephritis, the magnesium level of the blood plasma may rise from the normal of about 2 mgm to 11 mgm per 100 cc of plasma after 20 to 30 Gm of epsom salts, and that such doses may produce drowsiness verging on coma He further pointed out that blood levels of 5 mgm of magnesium in animals render them extremely sensitive to ordinary doses of morphine I recall Dr Barr raising the point of the danger of morphine in the uremic patient at one of our previous conferences Hirschfelder's paper refers to what may be the origin of that observation, namely, Osler's statement that patients with nephritis and very old persons should receive morphine with caution, the favorite saline purgative on his wards at Johns Hopkins was epsom salts

DR. BARR There are several matters concerning the use of eathertic agents which should be con sidered, but our time is now up Perhaps we might continue this discussion at the conference next week

(To be continued in March I issue)

THE EARLY DIAGNOSIS OF TUMORS OF THE PROXIMAL (RIGHT) COLON

346

THOMAS H RUSSELL, M.D., New York City (From the Surgical Service of the Post-Graduate Hospital)

DURING 1945, the author operated upon 14 patients for intestinal obstruction due to malignant tumors of the right colon. Eleven patients had a palpable mass when first examined At operation 5 patients presented metastases in the liver and other intra-abdominal organs to such an extent as to render radical resection impracticable. Many of the patients showed symptoms which had remained unrecognized for months or even years. In this discussion, we thought that it might be appropriate to call the attention of the members of this Society to the following

- 1 Frequency of carcinoma of the right colon and the ease with which it may be over looked until its late manifestations
- 2 The necessity for careful gastrointestinal x ray examination especially barium colon enema, when a lesion of the proximal colon is suspected

Presented, by invitation, at the 140th Annual Meeting of the Medical Society of the State of New York, Section on Surgery May 2 1946 Anatomically, the most common tumor of the right colon is the polypoid proliferative carci noma, in contrast to the annular scirrhous type found in the left colon Tumors in the proximal colon are usually of a low order of malignancy. They grow alowly and do not tend to encircle and constrict the intestine The contents of the right colon are liquid in character, and since it is a capacious structure, obstruction is a late manifestation. Thus, a palpable mass is a late again of this disease. Like carcinoma elsewhere, the mortality and morbidity and the extension of life are dependent upon early diagnosis.

The early picture of malignancy of the prox mal colon may be separated roughly into two groups which frequently overlap. The first is characterized by vague signs and symptoms suggestive of inflammatory lesions of the appendix or the gallbladder. Among our patients the most prominent early symptom of this group was a sensation of fullness in the abdomen after meals. These patients complained of dyspepsia and anorema, and in addition, of vague inconstant.

pain in the right side of the abdomen Careful questioning usually will reveal that, within the past few months or weeks, there has been some change in the bowel habits

The following two case histories are examples of this group, and in addition, they demonstrate that the proper evaluation of early signs and symptoms might have led to an earlier diagnosis of carcinoma of the right colon

The Dyspeptic Group

Case 1 -R. S, a 53-year-old white woman, was first admitted to Post-Graduate Hospital in June. 1945, with a chief complaint of "gallbladder trouble" Two years before, the patient first noticed intolerance to fried and fatty foods, characterized by pyrosis, gaseous eructations, and right upper quadrant Several months before admission to the Hospital, the patient had an episode of severe right upper quadrant pain which radiated to the right flank and to both shoulders This was associated with dyspepsia, nausea, and moderate retching Symptoms subsided after medication During the ensuing months, the patient suffered many similar attacks, though less severe in character Since the onset of her illness, there had been a weight loss of ten to fifteen pounds

Past history and family history were unsignificant Physical examination revealed a well-developed and well-nourished white woman who did not appear ill. Temperature was 98 8, pulse 72, and respirations 20 Except for enlargement of the heart, and blood pressure of 192/96, there were no noteworthy physical findings Laboratory examination revealed negative urinalysis, a sedimentation rate of 38 mm per hour, a red blood counto f 4 4 million, with 11 9 Gm (71 per cent) hemoglobin, and a white blood count of 8,900 with normal differential patient was treated by duodenal drainage and bellergal She was discharged after a few days, with a diagnosis of chronic cholecystitis Three weeks later, she was re-admitted complaining of cramplike pain of moderate severity, located in the right lower quadrant and associated with anorexia, weakness, fatigability, and continued loss of weight Since her discharge from the hospital, the patient complained of increasing constipation

At this admission, the significant physical findings were a tender, palpable mass in the right lower quadrant. The blood count and blood chemistry were within normal limits. After preparation, the patient was operated upon and found to have an obstructing carcinoma of the ascending colon with metastases to the liver and peritoneum. An ileotransverse colostomy with exclusion of the distal ileum was performed.

This history illustrates the type of carcinoma of the proximal colon which mimics gallbladder disease. It is important to note that the workup on the first admission did not confirm the diagnosis of cholecystitis. It is suggested, with a patient of this type, that a barium colon enema be performed, to rule out a malignant lesion of the right colon, even though none of the manifested symptoms point to the colon as the site of the disease.

Case 2 —O B, was a 60-year-old unmarried business woman, who was admitted to the hospital complaining of epigastric distress and gas, of ten months' duration. The gas was associated with mild, generalized abdominal pain, progressive weakness, anorexia, and continued weight loss. Since the onset of her illness, the patient had consulted several physicians, who prescribed symptomatic treatment.

An x-ray of the colon, taken six months prior to admission, was said to be negative. One week before coming to the hospital, the patient complained of abdominal distention, obstipation, and increasing weakness. Physical examination on admission revealed a chronically ill woman. The abdomen was distended and tender, and a mass which appeared to be fixed, was palpated in the right lower quadrant Rectal examination was negative. Blood count revealed 4.5 million red cells with a hemoglobin of 12.8 Gm. (77 per cent), 13,500 white blood cells, and a normal differential

At operation, the patient was found to have an obstructing carcinoma of the cecum with generalized abdominal carcinomatosis. A palliative, low, transverse ileocolostomy with exclusion of the distal ileum, was performed

This patient illustrates the dyspeptic type of history manifested in some cases of carcinoma of the right colon. She was treated only symptomatically by her family physician. On one occasion, however, a tumor of the colon was suspected, but after a negative barium colon enema, no further procedures were instituted.

The Anemia Group

Another clinical picture of carcinoma of the right colon is the anemia group. These patients complain of lassitude, weakness, and weight loss, and frequently may have no other symptoms, Examination of the blood reveals a microcytic type of secondary anemia. Occasionally the anemia may be profound. Nine of the 14 patients in our series had pronounced secondary anemia. The following two case histories illustrate this group, and indicate that the recognition of the importance of an existing secondary anemia might have led to earlier diagnosis.

Case 3 -F P, a 53-year-old foreman, was admitted to the Post-Graduate Hospital on the thirteenth of November, 1945, complaining of weakness and fatigue of three years' duration The patient stated that he had been well until three years before, when he began to suffer from weakness, fatigue, and pallor He saw his physician, who told him that his hemoglobin was only 42 per cent After two months' treatment with liver injections and lextron, the hemoglobin had risen to 72 per cent ensuing six months, in spite of continued therapy, it dropped to 52 per cent Treatment was continued for two and a half years, without any further change in hemoglobin The patient continued to suffer from increasing fatigue, weakness, and shortness of breath He also complained of numbness

and tingling in the lower extremities, and of difficulty in walking. He reported passing numerous tarry stools, but these were ascribed to the lextron capules. Throughout his illness, he suffered no loss of weight, and there was no change in bowel habits

Upon admission to the Hospital, physical exam ination revealed a well-developed and well-nour ished white man of 52 years, who appeared pale and chronically ill. His blood pressure was 120/30 temperature 100 pulse 96, respirations 22 Skin and mucous membranes were very pale. Examina tion of the abdomen revealed a mass in the right upper quadrant. Upon laboratory examination there were 3.2 million red blood cells with 5.5 Gm. (33 per cent) of hemoglobin 4 000 white cells with a normal differential There were 360 000 platelets. The reticulocyte count was 0 0 per cent. Bleeding and coagulation times were normal. There was a normal blood chemistry and a negative urinalysis Guaiac examination of the stool for occult blood tested 3 plus. Barium colon enema revealed an annular neoplastic type of infiltration at the hepatic flexure of the colon At operation, an obstructing carcinoma of the hepatic flexure was found, and a right colectomy was performed. Pathologic diag nosis was adenocarcinoma of the colon with metastases to the regional lymph nodes.

This patient illustrates the slowness of growth of carcinoma in the right colon, and reveals that the warning sign of unexplained secondary anemis may pass unheeded. This man had undergone treatment with liver and iron for two and a half years. The original improvement in the blood picture, although transitory misled the physician into a false security. It is possible that a barium colon enema, if performed early, would have resulted in a diagnosis many months before.

Case 4.—The second patient in this group was a 71 year-old-man admitted to the Hospital suffering from generalized weakness and a chronic anemia. Two years before, the patient had been hospitalized for rectal bleeding. A year after discharge, he experienced a second episode of bleeding from the rectum, for which he received no treatment. Shortly before his second hospital admission, the patient had a third, quite profuse, rectal homorrhage. Ex amination at that time showed the presence of a sovere anemia with a red count of 2.8 million and a hemoglobin of only 6.3 Gm (38 per cent) examination was negative. Sigmoidoscopic ex amination was negative except for internal hemorrhoids The patient received several blood transfusions, and was discharged with a diagnosis of arteriosclerotic heart disease and internal hemor rhoids. The following year he returned to the Hospital complaining of intermittent episodes of rectal bleeding. Except for extreme pallor physical ex amination was negative. The red count at this time showed 3.6 million cells with a hamoglobin of 7.5 Gm (45 per cent) Gastrointestinal series revealed a duodenal deformity suggestive of an ulcer The roentgenologist suspected a lesion of the proximal colon and advised a barium colon enema, which the patient refused. He left the hospital and a few months later was re-admitted, complaining of repeated attacks of severe rectal bleeding, continued anemia, and weakness. Upon admission, the partient appeared chronically ill and extremely pale. His abdomen was distended, and there was a mass palpable in the right lower quadrant. The blood ount showed 307 million red cells with a hemoglobin of 7.3 Gm. (44 per cent) After multiple transfusions of whole blood, he was operated upon. At operation a large carcinoma was found in the cecum, with metastases to the liver A low transverse fleocolostomy with exclusion of the distal fleum was performed

This patient illustrates the anemic type of car curoma of the right colon The danger sign had remained unheeded for two years, study having been directed to the lower colon and the upper gastro-intestinal tract. The diagnosis was not made until the symptoms had progressed to the stage of in operability

Comment

By the preceding case histories, we have tried to point out that an early diagnosis of malignant lesions of the right colon does not require any extraordinarily astute clinical sense. It does demand the awareness that a patient in or near the cancer age group who suffers from dyspeptic symptoms which are not readily ascribable to the appendix gallbladder, or stomach, and who, in addition, may have lost weight or has had a recent change in bowel habits, should be studied carefully for the presence of carcinoma of the right colon The same is true for the patient in the cancer age group who has an unexplained second ary anemia. Repeated x ray examinations by means of barium colon enema afford the safest and surest means of early diagnosis. If the enema is negative, a gastrointestinal series occasionally may reveal the presence of an early lesion.

Summary

- 1 Since so many of the patients seen in 1945 with carcinoma of the right colon, came to us undiagnosed and with the disease well advanced, we have emphasized the early manifestations of tumors of the proximal colon.
- 2 There are two clinical pictures of carcinoma of the right colon—the dyspeptic type and the anemic type.
- 3 Patients in the cancer age group with dyspepsia, which is not readily ascribed to the duodenum appendix, or the gallbiadder, should have a barium colon enema.
- 4 Patients in the cancer age group with unexplained secondary anemia should have a barium colon enema.
- 5 Repeated x ray examinations by means of barum colon enema afford the safest and the surest means of early diagnosis of carcinoma of the right colon.

ABSTRACT OF MINUTES OF THE COUNCIL OF THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

HE Council held its regular meeting on Thursday I morning, January 9, 1947, at the Society's offices In addition to minor routine matters, the Council has taken action and has under consideration matters as shown under the headings indicated.

Secretary's Report

Remission of State Assessments —The remission of State assessments was voted on account of service with the armed forces for 23 members in 1947, 12 in 1946, 3 in 1945, 1 in 1941, also on account of illness for Drs Lawrence Jacobius, Theodore N Alpert, Bernard F Schreiner, Edward H. Storck, Raymond E Elliott, and George W Guerinot The refunding of previous remission of State assessment for one member was authorized

Meetings Attended —Two days following the last Council meeting, your Secretary repaired to Chicago, first to attend the American Medical Associa-tion Conference of State Society Secretaries and Editors, and then the House of Delegates, December

9, 10, and 11

On December 13 he attended the first meeting of Committee appointed by Miss Mary Donlon, chairman, Workmen's Compensation Board, State Department of Labor, to consider and report to her concerning proposed changes in the Workmen's Compensation minimum fee schedule Present were Dr. France M. Conveys and Dr. Joseph Raphael of Dr Francis M Conway, and Dr Joseph Raphael of the Medical Practice Committee, Workmen's Com-pensation Board, and Miss C Hafele, executive secretary, Workmen's Compensation Board, also attended

On December 17, he attended the Annual Meeting of the Public Relations Committee of the Medical Society of the County of Monroe where the active Subcommittees' reports showed what fine endeavors are being brought to fruit for the welfare of Monroe County In the evening, President Hale, Mr An-derson, Mr Farrell, and myself attended a dinner given by the Medical Society of the County of Monroe to their new members Subsequently, we attended the Annual Meeting Dr Hale delivered attended the Annual Meeting Dr Hale delivered a very fine address, and Mr Farrell read an in-

formative paper

Also your Secretary has attended the various

committee meetings

Deaths —On December 17, he attended Dr James M Flynn's funeral in Rochester - Flowers had been sent from our Society, and a telegram of condolence The large medical attendance at to Mrs Flynn Dr Flynn's funeral was a fitting tribute to this forthright leader in our State

A telegram of condolence was sent in the name of the State Society that day to Mrs Sherman M Burns on account of the death of her husband,

President of the Fifth District Branch

Nomination to Grievance Committee -In accordance with the authority delegated to President Hale, a letter was sent to the New York State Education Department, nominating Dr William Walter Street for membership on the Medical Grievance Com-mittee, and Drs Fenwick Beekman and Gordon D Hoople, as alternates, also a telegram was sent to the Department, nominating Dr Austin G Morris to succeed himself on the same committee

Biennial Registration with State Department of Education —At the Secretary's request it was voted to instruct him to write each county society secretary that about 5,000 physicians in New York State were delinquent on January 1, 1947, in their biennial registration with the NY State Education Department as required by law, and to urge the secretaries to publicize the fact

Illness—It was voted that letters be sent to Drs Aranow, Sullivan, and Winslow, expressing sym-

pathy, and the hope for speedy recovery

Communications—1 Letter from Mrs Sullivan stating that Dr F Leslie Sullivan's condition had improved 2 Let

Letter of appreciation from Mrs Kirby Dwight for the tribute paid to Dr Dwight in the resolution passed by the Council and Board of Trustees, and for the flowers sent to his funeral

Invitation from the American Social Hygiene Association, Inc, for the Medical Society of the State of New York to be a cosponsor of their Re-

gional Conference on February 5, 1947

It was voted to serve as one of the cosponsors of this meeting

Treasurer's Report was accepted

Report of the Executive Officer

Dr Hannon reported verbally that on December 5 he attended a conference in Albany on revision of the Education Law The discussion was on the section governing the practice of medicine A proposed revision developed by the Joint Legislative Committee of the Governor's and the Department of Education, primarily straightens out the law, bringing in the amendments and rewording certain sections of it without any essential alteration There will be a change in the numbering of sections and articles, and a proposed change in title to read "Medicine, Osteopathy, and Physiotherapy" The reason for the new title is mainly for indexing These proposed revisions have been considered by the Legislative Committee, and nothing objectionable has been found

He received a letter from the Medical Society of Monroe County about proposed legislation on practical nurses The Legislative Committee and the Council have already expressed an opinion that the existing laws should not be altered, and against changing the name of "practical nurse" to "trained attendary" and that the beauty of practical nurses of the standard of th attendant," and that the licensing of practical nurses should not be discontinued. He informed Monroe

County Legislative Committee accordingly

He also received a letter dated January 3, 1947, from Chancellor William D Wallin of the Board of Regents, stating in part that the Board of Regents has authorized a Conference on Nursing Supply and Professional Preparation to be held at 200 PM, January 15, in the Regents Room, State Education Department, Albany It is planned that the Com-mittee on Higher Education of the Board of Re-gents and representatives of the State Education Department will meet with individuals and representatives of interested groups for a discussion of this subject

Dr Hannon reported he attended the House of Delegates of the American Medical Association in Chicago, and the Annual Meeting of the Medical

Society of Monroe County
Dr Hannon stated that the Legislature had opened the previous day, and he would appreciate

receiving copies of any bills to be introduced for the Society at the earliest date possible

The report was accepted

Activities of Committees

Committee on Legislation -As Dr Aranow Chairman, was ill and excused, Dr Hannon s report

as given above, was accepted for the Committee.

Committee on Constitution and Bylaws.—Dr Reuling Chairman reported that there were two requests for approval of changes in the Constitution and Bylaws-one from Eric County was approved the other from St. Lawrence County was not clear, so the Secretary has written and asked that

it be clarified.

Committee on Questions on Ethics.-Dr Reuling, Chairman requested the Secretary to report on a query he had received from Richmond County Medical Society Dr Anderton reported that they had inquired whether or not a doctor returning from service, or a doctor commencing to practice in a community for the first time, was ethically justified in sending, indiscriminately, notices through the mall of the location of his office. After consultation with Dr Reuling word was sent to them that this was a direct violation of Section 51-A of the Principles of Professional Conduct, and that there also is a passage in the Education Law that makes it illegal to advertise by handbills or other methods.

Joint Committee of the Hospital Association of

New York and the Medical Society of the State of New York .- Dr Werts Chairman, stated a meeting of the Joint Committee of the Hospital Association of New York and the Medical Society of the State of New York was held on December 30 at this office. Drs. Mott, Kenney and Anderton, and Mr Farrell represented the Society and Dr Kaliski represented the Workmen's Compensation Bureau, Dr M J Fein the Joint Council of Radiologists Pathologists, Anesthesiologists and Physical Ther apy Physicians Dr Hinenburg, and Messus. McCormack and McDermott represented the Hospital Association. Mr Roderick Wellman, counsel for the Hospital Association also attended After more than two hours of discussion on the resolutions passed by the Council and approved by the State Hospital Association's Special Committee it was decided to adjourn and hold another meeting in the near future. The question at issue is the status of the four specialties (x ray, pathology anesthesia and physical medicine) as the practice of medicine Although the Margital Although the Special Committee of the Hospital Association, under the chairmanship of its then president, Mr John McCormek adopted resolutions which recognized these specialities as the practical which recognized these specialities as the practical state of the special transfer of the special tice of medicine, the New York State Hospital Asso-clation as a whole we are now informed never took any action approving the unanimous report of its own committee

Counsels for the State Hospital Association, for the Council of Radiologists, Pathologists, Anesthesiologists, and Physical Therapy Physicians and Counsel for the State Medical Society met after the above meeting and discussed pertinent legislation on this subject for submission to the Legislature and agreed upon an amendment to both the Work men's Compensation Law and the Education Law to label these four specialties the practice of medi

These amendments were discussed but no action was taken

Malpractice Insurance and Defense Board.—Dr Kenney, Chairman, reported that the Board met on January 7 1947, that they were studying several problems and giving serious consideration to certain policies, but have come to no final conclusions that they were devoting a great deal of time to considera tion of the resolutions submitted to the House of Delegates from Bronx County relative to fundamental changes in policy The Board was to reconvene on the fourth of February, and on the eighteenth, at which time decisions should have been reached for report to the Council.

Final action was taken on one of the resolutions about the annual audit, and is submitted to the

Council for action, as follows

This resolution as amended requires that the Society have made a yearly audit including an in-spection of the vouchers of the Group Plan by a cer-tified public accountant, and that the audit be submitted to the Comitis Minora of each county medical society at least thirty days previous to the annual meeting of the State Medical Society

"This resolution was adopted by the House of Delegates leaving the plan, the method, and the time of the audit to the Council. It was referred by the Council to this Board for its recommendations.

'After thorough discussion, the Board is of the opinion that the first step in compliance with this directive is to fix the scope of the audit. The resolu-tion specifically calls for an inspection of the vouchers. All vouchers, back to January 1, 1936 are accumulatively included in current cost accounting and to audit them would require an examina tion of original data in the office of the legal counsel and the Yorkshire Indemnity Company Such an audit would be a long drawn out and expensive un dertaking

The Board recommends, therefore, that the accountants be directed to inspect all vouchers to see that they are properly made signed and accounted for, and that the cost of tabulation and rate computations are correctly made from them While such an audit is more properly the work of independent insurance actuaries than public accountants, the services of independent actuaries are very expensive and it is believed that public accountants will be able to verify the correctness of the records and accounts so as to comply fully with the directive

If the regular auditors of the Society are unable to take on this additional work, the Board will be willing to select and recommend a firm of accountants to the Council. In the meantime, the Board recommends that the Council request the Board of Trustees to appropriate a sum not to exceed \$1,200 to cover the probable outside cost of the audit.

Dr Kenney so recommended.

After discussion,

It was roted to pass the recommendation and request Dr Kenney to obtain an estimate of the cost of such audit for submission to the Board of Trustees.

Committee on Medical Publicity -Mr Anderson, in the absence of Dr Winslow, stated that the report as distributed with the agenda is as follows

"Releases concerning teaching days and other educational events sponsored by the Committee on Postgraduate Education were sent to newspapers in the counties of Richmond, St Lawrence, Jefferson, Chenango, Tioga and the cities of Troy and Geneva.

"Mr Anderson, Miss Lyon and Mr Walsh attended the midwinter meeting of the A.M.A. in Chicago from December 9 to 11, including the or ganisation meeting of the Medical Society Executives Conference

Mr Anderson attended the annual meeting of

the Monroe County Medical Society in Rochester.

December 7

"Mailings have been started on 'Check and Double Check' with 16,000 circulars about to go out Orders have been received for 3,750 copies, of which 2.900 have been sold at our quoted prices Some of the large orders received from various parts of the country include 1,000 from the A.M A., another 1,000 for the National Physicians Committee, 400 for the Ohio State Medical Society, and 100, respectively, for the Texas State Medical Society, and

the Medical Society of Virginia
"'Check and Double Check' started coming off the presses in time for distribution to officers and and executives attending the AMA, meeting in

December
"Of interest to the Public Relations Bureau was a recent newscast from Chicago featuring a statement of Dr Frank G Dickinson, new head of the Bureau of Medical Economics, A M A, in which facts and figures from 'Check and Double Check' were quoted

"Miss Lyon held conferences with Mrs Madden. President of the Woman's Auxiliary on December 16, and with Mrs Schultz, program chairman, on December 17 Possibilities were discussed for dis-tribution to school libraries of 'Check and Double

Check' through the Auxiliary

"Assistance was given Miss Marshall, a writer for King Features Syndicate, in the preparation of an article on genatrics Another writer, Mrs Sara Carlton, is preparing to write a magazine article on the antivivisection issue and is receiving assistance from the Bureau'

Committee on Office Administration and Policies —Dr Anderton, at the request of the Charman, Dr Masterson, reported that the Committee met on January 7, 1947, and voted one recommenda-

tion to the Council

"That the State Society join the National Industrial Conference Board as a source of business and professional information of value to the Society and to the Office Administration and Policies Commit-The dues are \$150 a year "

It was voted that approval be given to this recommendation

Committee on Public Health and Education -

Dr Mitchell, Chairman, reported as follows

December 9, 10, and 11 In Chicago, the Chairman attended the meeting of the House of Delegates of the American Medical Association

December 18, 1946 In Syracuse, held a conference with some of the members of the Council Committee on Public Health and Education and representatives of the New York State Department of Health, the New York State Health Preparedness Commission, and the Joint Hospital Board of the New York State Postwar Public Works Planning Commission to discuss medical and health problems in Otsego County

January 8, 1947 In New York City, held a meeting of the Council Committee on Public Health and Education and the Subcommittee on Child Welfare Also present were some of the officers of the Medical Society of the State of New York and representa-tives of the New York State Department of Health

It was a long session and several matters were discussed First, the proposed use of BCG vaccine in New York State as part of the tuberculosis program There is in the Division of Laboratory Research in connection with tuberculosis control, a very able man who has devoted years of his life to this particular subject Dr Conrad Birkhaug, who was born in Norway, but has been an American citizen since 1915 He has consented to help

It was the consensus of opinion that the medical practitioners in our State should be informed about BCG immunization, not with the idea that the doctor in general administer it, but he ought to be in a position to tell people what he thinks of it, and of the new developments The idea was to have small groups of men, who know the most about it, meet in conference with representatives of the Government and decide what should be done, and to choose speakers who can go before various audiences This was agreed to by Dr Birkhaug, the Deputy Commissioner, and Dr James E Perkins, who is in charge of the Tuberculosis Control Program, so that within the next four to eight weeks such groups can meet

Second, The Health Department is anxious to get information about hepatitis and jaundice from anybody who has received injections of their plasma products. They submitted a form to be sent to the doctors which the Committee approved

The third thing that came up concerned the consultation service in pediatrics. The plan has not been developed sufficiently to receive our approval The plan has not

No final action was taken

Also on this same day in New York City, held a meeting of the Council Committee on Public Health and Education and the Subcommittee on Rehabilitation, and the Subcommittee on Hard of Hearing and the Deaf Also present at this conference were some of the officers of the Medical Society of the State of New York and representatives of the New York State Departments of Health, Education, and Social Welfare

The Deafness and Hard of Hearing Program is oving slowly We have a good committee, but do moving slowly not have the facilities or personnel to make the program progress well It goes best in New York City where conservation of hearing clinics have been established To sum up, we again called attention to the need for the Government to provide personnel, hoping that something could be accomplished at the

meeting of the Legislature or in Washington Subcommittee on Mental Hygiene —The report from the Chairman of the Subcommittee on Mental Hygiene, Dr Wortis, which was not received in time

for the last Council meeting, is as follows

The Branch Office of the Veterans Administra-tion has set up for the New York City area an Ad-visory Board of Neuropsychiatrists to assist the Veterans Administration in establishing the highestethical professional standards in the care and treatment of veterans suffering from neuropsychiatric disabilities The names of the Advisory Board are

available through Dr Anderton's office It was felt that all psychiatrists seeking certification to treat veterans in the New York City area should complete a questionnaire which would in-clude their background, education, training, and evperience in psychiatry, and whether they were certified by the American Board of Psychiatry and Neurology All psychiatrists seeking panel recognition should complete such form and this questionnaire was to be submitted to the Advisory Board who would give temporary approval for a six months' period to such neuropsychiatrists they felt were qualified to do this work with veterans

It was also agreed that a screening unit be established at the local Veterans Administration Mental Hygiene Clinic where veterans needing neuropsychiatric treatment would be seen and proper treatment recommended Such screening, it was believed, was an important portion of the treatment

program

It is believed that this plan of setting up a panel

of qualified psychiatrists was desirable and should perhaps be copied in other areas of New York State

Your Committee also believes it is important that Veteran Administration physicians when refer ring a veteran for treatment, should submit to the physician who will give such treatment a brief transscript of the relevant military medical record that would aid the physician in his treatment program.

This information is sent to you for transmission to the Committee on Public Health and Education with the hope that it will receive your approval.

Dr Mitchell replied as follows

This is in reply to your letter of December 4 regarding the plan for approval of neuropsychiatrists in connection with the Veterans Administration. I see no objection to the scheme which is outlined but I do not read into it that the Subcommittee on Mental Hygiene of the Medical Society of the State of

New York has any part in the plan
At the time of the meeting, I endeavored to ex plain that several of our committees were advisory committees to some of the state agencies dealing with medical and public health activities I think it would be very denrable and in keeping with the policy of the Medical Society of the State of New lork to have your Committee on Mental Hygiene regarded as an advisory committee to the Veterans Administration on approval and certification of physicians dearing recognition as approved psychia trists. It has been our experience that this plan has been most satisfactory in other specialties. Please let me know as soon as possible if this suggestion meets with your approval and whother any action has been taken by the Veterans Administration to desire such cooperation.

Dr Wortis replied that it met with his approval

He also reported on a meeting of the Joint Leg islature Committee to Study the Problem of Cerebral Palsy which was held in New York City Dr Wortls was not able to attend, but Dr Steckel, an other member of the Subcommittee, was present

Dr Steckel indicated that the meeting was crowded and he, therefore, did not have a chance to make a statement but suggested we write a letter to Senator Frederick Hammer endorsing research and additional work in this field of cerebral palsy approved a letter should be sent to Senator Fred erick Hammer 261 Broadway New York City, along the following lines, indicating that our Com mittee believes there is real need for additional facilities for research and treatment for patients afflicted with crebral palsy also that considerable reconstruction work in the field of cerebral palsy has been done in the past at the Newark State School, New

ark, New York.

Dr. Mitchall stated he had not done this as he was awaiting a report and opinion from Dr Steckel. When he receives it he will proceed accordingly
It was roted that this part of the report be received

by the Council.

A communication was received from the State Education Department regarding the reappointment of your Chairman to the Advisory Council on Health and Physical Education, for a term of three years, beginning October 1, 1946

This appointment has been accepted

As Dr. Rogers, the assistant commissioner for
Medical Administration in the NY State Department of Health is resigning. Dr Mitchell suggested that the President appoint Dr James E. Perkins as adviser on the Public Health and Education Committee, in his place

It was roled that this appointment be made Postgraduate Education.—Postgraduate instruction is being presented in Nassau, Jefferson. On tario, Richmond, and St Lawrence county medical societies.

Requests for instruction to be given in the near future have been received from Saranac Lake Medical Society and the county medical societies of Al-

bany, Cattaraugus, Saratoga, and Sullivan

Committee on Public Relations and Economics.-Dr Worts, Chairman, requested Mr Farrell, Drector of Medical Care Insurance Bureau, to report on the activities of the Bureau, which he did as follows

On December 6 your Director went to Chicago On December 7 he had an invitation from Dr Bauer to attend the meeting of the Council on Medical Service of the American Medical Association. On December 9 your Director attended a meeting of the Associated Medical Care Plans, also the House of Delegates Meeting on the ninth, tenth, and eleventh of December

On December 17 he spoke at the Annual Meeting of the Medical Society of the County of Monroe on

the progress of medical care plans

On December 30 on invitation of Dr Wertz, your Director attended a meeting of the Joint Committee of the Hospital Association of New York and the Medical Society of the State of New York at the Society's offices.

The report was received.

Publication Committee.—Dr Kosmak, Chairman, reported verbally as follows "The Publication Committee held its meeting on January 7, and discussed the usual routine matters that come before it

every month.

Directory The 1947 issue of the Directory will probably be distributed in April. It is likely there will be many errors in it because of the difficulty of obtaining the necessary information. In view of this fact and the numerous changes in addresses, it is felt that preparations should be begun as soon as possible to issue another volume in 1948. It is necessary in developing this Directory to have a compe-tent staff As it is difficult to organize such a staff, it is felt that it would be of great advantage to continue the present staff

Journal The JOURNAL is operating satisfactorily

from a financial point of view The advertising

revenue is keeping up
The Publication Committee and the Office Ad ministration Committee have been rather concerned with the Society's income in the sense that the allocations for the JOURNAL and Directory from the treasury will have to be largely increased in the next treasury will have to be largely increased in the next year or two. The costs of printing have gone up to a very marked degree. They may be as much as 20 per cent more than they were previously. That brings up the question of possibly increasing the Society's dues. That matter, of course as you know, can only be taken up by the House of Delector, gates, and whether it will be taken up at the next meeting or not remains to be seen. However, we feel that some effort should be made to acquaint the members with the need for increasing the dues to meet the necessary expenditures of the Society

The Society has grown enormously in recent years. Its obligations have increased. It is necessary therefore to have more funds on hand than we have had in previous years for the reasons I have

stated.

We are publishing in an early issue of the JOURNAL a compilation of the dues of all other state societies, and I hope you will give this your particular attention because it is quite evident from comparison that most of the state societies have larger annual dues than we do California, I happen to remember, is \$100 a year, some of the Mid-Western states have \$25 a year, and we are among the lowest with only a \$10 assessment

We would like to carry some articles in the JOURNAL showing what the Society is doing, and what the members receive for their dues, and wish to have the approval of the Council to do this

This approval was given The report was accepted

Committee on Veterans Affairs —Dr Mellen, Chairman, reported that a questionnaire had been sent to secretaries of the county societies, and that their cooperation had been good Inquiries have almost ceased, and he thought that probably in another month or so, the Committee would no longer be needed

Committee on Liaison with Veterans Administration.—As Dr Bauckus, Chairman of Committee on Liaison with Veterans Administration, was unable to be present, Dr Wertz reported for him He stated that Dr Bauckus was quite concerned about, and thinks that the Council ought to protest the fact that the Veterans Bureau is now making contracts with the Blue Cross Organizations in four areas in the State under which they are going to render hospital care for veterans The contracts will include full care at the old EMIC rate of costs, which would include x-ray, anesthesiology, and some other services which we have in our fee schedule He also stated that the Committee had already sent a strong protest to Mr Lee B Mailler, president of the N Y State Hospital Association, a month ago, that hospitals should not enter into contracts pro-viding for these services, but that no answer had been received from Mr Mailler

It was brought out in discussion that there had been agreement by the Hospital Association to recognize these four specialties as the practice of medicine, and that the Blue Cross would remove them from the hospital contract, whenever medical care contracts were available, and transfer them to the medical care contracts, that the Veterans' Service Corporation's contract is in effect a medical care contract, therefore, there is no excuse for their incorporating them into a hospital contract when provision has already been made for the payment of

these services in the veterans' program

It was voted that it be called to the attention of the Hospital Association that their effort to put these specialties into a hospital contract is in effect a violation of the agreement or the spirit of the agreement which they made with us on the subject, and also that this communication be sent to each of the Blue Cross organizations in the four areas—Syracuse, Buffalo, Albany, and New York City

Woman's Auxiliary - Dr Reuling, Chairman of the Advisory Committee, read a report in which the President of the Woman's Auxiliary stated that she had attended and addressed four meetings of county societies, that Delaware County could not organize due to lack of available meeting space, and that Monroe County could not organize until February, due to the illness of Dr Lakeman, that on December 9 to 13, 1946, she and the President-Elect had attended the midwinter conference of presidents of the Woman's Auxiliary to the American Medical Association, and that New York State was the only state to date which had worked on the Pediatric

Committee on Workmen's Compensation —Dr Dattelbaum, Chairman, reported as follows

We have removed the office of the Bureau to the

sixteenth floor of this building

The Bureau has been very busy in preparing lists of physicians for various county medical societies and for the coordinators of the veterans' bureaus We contemplate a revision of all county lists in the near future so that the names of all doctors qualified under the Workmen's Compensation Law will be readily available The lists are now up to date in all the larger counties

Fees for Orthopedic Specialists A conference was held with officials of the New York City Board of Transportation concerning the fees payable to orthopedic specialists for diathermia treatment This organization has persisted in interpreting the fee schedule to mean that only physical therapy specialists are entitled to a fee of \$3 00 for treatment It is and was our contention that the fee for orthopedic specialists for after-care is \$3 00 and they are entitled to this fee for all treatments regardless of the type of treatment A satisfactory agreement was reached concerning future payments to orthopedic specialists. The specific item in the fee schedule calling for \$2.00 has been removed from the proposed fee schedule A request for an opinion on this matter was made to the Chairman of the Medical Practice Committee on October 7, 1946, and again on December 10, but to date we have failed to

receive a reply

Trial in Sullivan County No decision has as yet been handed down by the Chairman of the Workmen's Compensation Board in connection with the case of a physician who was recently tried in Sullivan County for failure to file reports with the Workmen's Compensation Board and with the employer

or carrier

M-17 Thoracic Surgery No decision has thus far been rendered by Miss Donlon concerning the sym-

bol M-17 (thoracic surgery)
Report Forms There is a persistent and increasing demand from all parts of the State for the various forms required for reporting compensation cases—C-104, C-4, C-5, C-14, and C-27 On a number of occasions we have informed the Workmen's Compensation Board of the needs of the various county medical societies based upon a survey made by this Bureau, but the situation has not been im-proved This matter was drawn to the attention of Miss Dolon, who has replied that the Department during the past year distributed over three million forms to county societies and there is no possibility in the near future of obtaining a larger supply of forms owing to the paper shortage It was her opinion that the physicians should be more careful in the use of the forms We therefore issued Bulletin number 71 to all county medical societies throughout the State and asked for additional information concerning the needs of the doctors, based upon a direct Some years ago we studied the feasibility of printing and distributing forms at cost to the county medical societies, but at that time it was not deemed advisable to enter into this project physicians do not receive forms in adequate numbers they cannot report promptly The Bureau through your Director will shortly confer with Mr Henry D Sayer of the Compensation Insurance Rating Board on this matter

Fee Schedule We have submitted additional let-

ters concerning the proposed fee schedule to the chairman of the Workmen's Compensation Board but have no further information concerning the status of this matter at this time. The proposed schedule has been submitted by Miss Donlon to a Committee appointed by her to consider it and make recommendations The Chairman of the Committee is Dr Nathan B Van Etten.

1 Domestic Workers On December 27 we issued Bulletin number 70 referring to the coverage of domestic workers, an amendment to the Workmen's Compensation Law which went into effect on Jan

Joint Meeting of Hospital Association and State Medical Society The substance of this is essentially the same as reported by Dr Wertz Chairman of the Joint Committee of the Hospital Association of New York and the Medical Society of the State of New

York (q 🕶)

Other Meetings Your Director attended meetings of the New York Association of Anesthesiologists and participated in a conference held before the Superintendent of Insurance on December 18, 1940 concerning the right of hospitals to collect fees for services rendered by physicians under various forms of medical insurance and hospitalization policies

It is very simple for us to write an amondment to the Workmen a Compensation Law to include the four specialties of anesthesiology pathology, radi closy, and physical therapy as a practice of medicine under Section 18-f because the Workmen's Compensation Law states that only a physician shall be paid for medical and surgical services and that the hos-pital shall not be paid the fees coming to physicians. We have no trouble under the Workmen's Compensation Law, and the Council has already approved an amendment to that section including these four specialties. On the other hand the hospital group states that if there is an amendment to the Educa tion Law to include these specialties there would be no necessity to amond the Workmen a Compensa tion Law because that is already in the fundamental basic law After discussion,

It was voted to receive the report

New Business.—The President, Dr Hale, an nounced that the Annual Reports of Committees should be in the hands of the Socretary by the first of March at the latest.

Because of the recent death of Dr Sherman M Burns, of Oswego, the President of the Fifth Dis-trict Branch the First Vice-President, Dr Vickers, will now assume the office of President of the Fifth

Dutnet Branch.

At the last meeting it was voted to appoint a subcommittee under the Legislative Committee on the Study of Podiatry Dr Aranow Dr Beverly C Smith, and Dr Robert Boggs are the committee suggested.

It was roted to approve this committee
Approval was roted on the appointment of Dr W
Geensey Frey, Jr., to the Council Committee on
Numing Education.

It was soled that the President be authorized to appoint a member to the Malpractice Insurance and Defense Board to take the place of Dr

James M Flynn, deceased.

It was roted that Dr Edward R. Cunnific be appointed to fill the position of Trustee left vacant by the death of Dr Kirby Dwight, until the next meeting of the House of Delegates. The President appointed Dr Floyd S Winslow to well.

to write a memorial resolution on Dr James M Flynn to be introduced at the next Council meetlog.

It was roted that our two ex Presidents of the A.M.A. be sent to the Annual Meeting of the A.M.A., and their expenses be taken care of on the same basis as a delegate

Report of A.M.A. Meeting.—The following re-port was presented by Dr Anderton for Dr Floyd 8 Winslow

The Medical Society of the State of New York was represented by the following delegates at the meet represented by the following designates of the American Medical Association in Chicago, Illinois, December 0to 11, 1946 Dr. Herbert H. Bauckus, Dr. James R. Reuling, Dr. Stophen H. Curtis, Dr. O. W. H. Mitchell, Dr. W. P. Anderton, Dr. B. Wallace, Hamilton, Dr. Albert F. R. Andresen, H Mitchell, Dr W r Angerum, Dr D use lace Hamilton, Dr Albert F R Andresen, Dr Floyd S Winslow, Dr Clarence G Band, ler, Dr W Guernsey Frey, Jr, Dr Thomas A. McGoldrick, Dr John J Masterson Dr Stephen R. Monteith, Dr J Stanley Kenny, Dr George W Kosmak, Dr Thomas M D Angelo Dr Edward P Flood, Dr Harry Aranow Dr Scott Lord Smith, and Dr Walter W Mott.

'Dr Louis H Bauer, Trustee of the American Medical Association, and Dr Charles Gordon Heyd, ex President of the American Medical Association

ex President of the American Medical Association Dr Roy B Henlino, Delegate from the Section on Urology of the American Medical Association, and Dr Edward R. Cunnific Chairman of the Judicial Council of the American Medical Association, were

also in attendance

The delegation met Sunday evening, December 8 when Drs Bauckus, Mitchell and Anderton were appointed to compose and introduce a resolution urging the U.S Veterans Administration not to include the practice of anesthesology pathology radiology and physical therapy in contracts with hospitals. Such a resolution was introduced by Dr Bauckus, favorably reported by the Reference Committee on Miscellaneous Business, and adopted

On Tuesday evening, December 10, 1946 the New York delegation met with Mr McDavitt of the Logal Department of the American Medical Association. We studied in detail proposed amend ments to the bylaws of the American Medical Asso-ciation. These proposed amendments were not acted upon by the House of Delegates, but were referred back to the appropriate committee for presentation at the Annual Meeting next June.

It gives me pleasure also to report that Dr Albert Frank Andresen was Chairman of the Reference Committee on Sections and Sessions, that Dr Ed ward P Flood was Chairman of the Reference Committee on Rules and Order of Business, Dr John J Masterson was a member of the Reference Committee on Legalation, Dr Clarence G Bandler Chauman of the Reference Committee on Report of Secretary and Board of Trustees, and Dr Her bert H. Bauckus was Chairman of and Dr J Stanley Kenney, a member of the Reference Committee on Report of Council on Medical Service.

Also present were Meeers. Anderson, Walsh, Farrell, and Miss Yolande Lyon...

'Copies of Check and Double Check on Sickness Insurance' were distributed to many members of the House of Delegates

The House of Delegates received a Committee report on the report of the Rich Associates, Public Relations Counsel regarding the American Medical Association, and transacted other business delegates attended the sessions regularly and took an active part in the proceedings I believe our Society was officiently represented.

This report was accepted

MEDICAL NEWS

New Era for Medical Practice Predicted by Dean Rappleye

MEDICAL practice in the United States faces a new era in the near future, an era to be marked by gradual changes in the fundamental form of medical practice, it was predicted on January 15 by Dean Willard C Rappleye, of Columbia Univer-sity's College of Physicians and Surgeons The advances will come, he declared in his annual

report to acting president of the University, Dr Frank D Fackenthal, as a result of underlying changes in community responsibility for health services and the enormous advances in medical science in recent years. Noting that the increase in medical knowledge has been greater in the last fifty years than in the previous four thousand, Dean Rappleye asserted that knowledge is now so complex that complete medical service can no longer be rendered by an individual physician alone of the precedity of contraction between specialists.

"The necessity of cooperation between specialists in the care and treatment of many illnesses and in many phases of individual preventive medicine

suggests some form of group responsibility and coordination of the services and knowledge required for the care of a given patient," he declared

"The general community hospital will be the base of modern medical service in the future," Dean Rappleye predicted "It will be a wholly self-sufficient

organization"
"It must include not only laboratories equipped and manned to provide diagnostic services but increasingly must provide determinations to guide the doctor in the control of therapeutic procedures," he declared 'It must include an outpatient service for follow-up, rehabilitation, ambulatory, and home treatment, much of which, if well-utilized, can relieve the demands for expensive inpatient hospital care It should gradually provide office facilities for more practitioners who on the basis of 'geographic full-time' can greatly increase their effectiveness and service to the community at lowered cost and with greater satisfaction to themselves'

Tuberculosis and Health Conference to Be Held in March

THE Annual Conference of the New York Tuber-culosis and Health Association will be held Thursday, March 20, 1947, at the Hotel Pennsylvania, New York City
Authorities on various phases of tuberculosis work, social hygiene, and health education will

present papers at morning and afternoon sessions A noted health authority, to be announced later, will address the luncheon meeting

Election of officers of the Tuberculosis Sanatonum Conference of Metropolitan New York, which will

meet simultaneously, also will be held

Personalities

Dr N Thomas Saxl, of New York City, was re-cently awarded the New York State Conspicuous

Service Cross

Quotation from communication reads "The New York State Conspicuous Service Cross 18 awarded by the Governor in the name of the Legislature to citizens of the State whose service to their Country in the Armed Forces has been exceptionally meritorious "

Dr Lewis FitzSimmons was 90 years old, December 13, and is still active in his practice as physician in the Pulteney area although he says that

from now on he is "going to take it easy "

"Perhaps people of an older generation will remember me best," smiles the doctor with the trim, white, pointed beard that gives him such a dis-tinguished air, "as the doctor at Savona some 65 years ago who drove a team of mustangs up and down the Cohocton valley and over the adjoining hills, and of whom it was commonly said that 'he would visit his patients if the devil himself stood in front of him '"

The doctor was born in the Town of Bath, near Savona He was graduated from Haverling Academy

and Madison, now known as Colgate University
He did what he calls "studying to care for the
sick" at Walters Park sanitorium near Warnersville, Pa, and later in the office of Dr J D Mitchell He also attended medical lectures in New York City, graduating from the Long Island College of Medicine He began his practice at Savona but came to Pulteney about 60 years ago

and has been active as a physician in that section of Steuben County ever since.*

Dr Grosvenor S Farmer, of Watertown, Northern New York's oldest physician and one of the oldest in the State, was 97 recently He was born in the town of Fowler, near Hallesboro, January 6, 1850, was graduated from the New York Homeopathic Hospital in 1874.

Thereupon he began practice in Gouverneur where he remained until 1880, when he came to Watertown, opening an office in the Paddock Arcade, where he remained forty-three years A son, Dr Harlow G Farmer, is carrying on in the profession since his father, is carrying on in the pro-

fession since his father retired

Dr I Newton Kugelmass, New York City pediatrıcıan, has been appointed consultant nutritionist in the Department of Health and the Department of Hospitals in New York City

Dr Arthur Hacker, of Albany, began the practice of medicine in Round Lake January 2

Dr Hacker was recently discharged from the Army after serving as a captain in the Medical

He saw active service in the European Theater of Operations for two and a half years

^{*} Asterisk indicates that item is from a local newspaper

Dr Hacker is a graduate of Albany Medical Col lege and interned at Albany Hospital

Dr Frederick H. Ben, a former resident doctor of South Nassau Community Hospital, Rockville Centre, has opened a private practice in Rockville Centre.

Dr Ben was a resident doctor at the Hospital for two years prior to entering the Army in 1944. He had practiced medicine for ten years prior to that in the State of New York. While in the Army he

served in Oklahoma and overseas in Italy He has been a resident doctor at the South Nassau Community hospital since his release from the

Army in April, 1946.

Dr Adolph G De Sanctis, director of the de-partment of pediatrics of the New York Poet-Graduate Medical School and Hospital, Columbia University, spoke at a two-day scientific program in January in New Orleans observing the completion of the new Hotel de Dieu pediatrics department.

Dr Julius C Gray, of New Rochelle, was granted an active fellowship by the American College of Surgeons at its annual meeting in Cleveland.

Dr Gray a practicing physician in New Rochelle for many years, received his fellowship in the division

of obstetrics and gynecology

Dr Abraham Stone, of New York City, was named on January 25 as a winner of the third annual Lasker Awards of the Planned Parenthood Federation of America by Dr Robert L. Dickinson, spokesman for the Federation's Lasker Award Committee

The awards were given this year for distinguished

leadership in marriage counselling

Dr I Newton Kugelmass, of New York City, spoke on 'Individual vs. Mass Management of Malnutrition, at the Pratt Institute, on January 22

County News

Albany County

Dr Konrad Birkhaug, associate medical bac-tenologist, New York State Division of Laboratories, was the guest speaker at the January meeting of the County Society. His topic was "Twenty Years of Experimental and Chnical BCG Vaccination in Scandinavia." Dr Birkhaug, a graduate of Johns Hopkina, class of 1924, is internationally known for his article. for his studies in chemotherapy and vaccination in the field of experimental tuberculous. He discussed the history of BCG and its exhaustive experimental and chnical data, a work in which he has been ac-tively engaged since 1926 in this country France, and Norway

Bronx County

The regular meeting of the Bronx County Medical Society was held at the Concourse Plaza Hotel on

January 15
Dr Abraham Hyman spoke on 'Nephrolithians'
Dr Abraham Hyman spoke on 'Nephrolithians' (a) Etiology and Pathogeness, (b) Diagnous, and (c) Treatment. Drs. Moses L. Gottlieb, Isidor Palsis, and John J Roth were the discussants.

Erie County

Dr William H. Handel, Erie County medical director has announced the appointments of Dr. Milton J Schulz, and Dr Aaron Wagner both of

Buffalo, as County medical examiners.

Dr Schuls was graduated from the University of Buffalo Medical School in 1925 and was engaged in private practice until 1942, when he was called late the Army as a captain. He was discharged last December

Dr Wagner who is a medical investigator in the welfare department, was graduated from the Uni-versity of Buffalo Medical School in 1933 and was cagaged in private practice late in 1934. He was affined to practice at the Home Relief Sheltor Wells and Carroll, from 1935 until 1942. Dr. Wag ner entered the Army in 1942 as a lieutenant and was discharged as was discharged as a captain last January

The other medical examiners are Drs. Paul J

Rutecki Rocco N De Dominicis, and Eugene W Wallace.*

Fulton County

At a regular meeting of the Saranac Lake Medical At a regular meeting of the carana Lake Medical Society on December 11 Dr Harry M. Rose, assist-ant professor of medicine, College of Physicians and Surgeons, Columbia University, presented a paper entitled, "The Common Enteric Infections Their Clinical Mamfestations, Diagnosis and Treatment."

On December 18 Dr K. G Hansson, assistant professor in charge of physical medicine, Cornell University Medical College, New York City pre-sented a paper entitled, "The Prescription of Phy sical Medicine in General Practice,' and on Januof Saranac Lake, presented a paper entitled, "Report on 75 Cases of Intracavity Drainage (Monaddi)"

At the January 15 meeting Basil G Bibby B.D.S. Ph.D., D M.D., Dean, Tuits Dental School, Boston, Mass., presented a paper on "Progress in Carles Control.

Kings County

At the regular stated meeting of the Medical Society of the County of Kings and the Academy of Medicine of Brootlyn on January 21 Dr Abra ham Koplowitz newly elected president of the Society, presented the inagural address entitled Are We Right? The scientific program connected of a lecture by Dr Samuel J Kopetsky, professor of cology New York Polychine Medical School, His subject was "Medical and Surgical Treatment for Deafners. Dealness.

The President's Dinner given annually to honor the outgoing president of the Society, was held on January 29 at the Hotel St. George. Dr. Thurman B Givan was the guest of honor. The dinner marked

the beginning of the one hundred and twenty-fifth year of the Society's activities. The dinner committee consisted of Drs Herbert T Wikle, charman, Charles F McCarty, secretary-treasurer, Louis Berger, Leo S Drexler, Abraham Koplowitz, George H Lordi, Charles H Loughran, John J Masterson, Henry Rascoff, Jacob Sarnoff, and Finer A Sunde and Emar A. Sunde

Nassau County

Cancer of the skin and allied tumors was the subject of a lecture given to members of the Society by Dr Earl D Osborne on January 28 Dr Osborne is professor of dermatology and syphilology, at the University of Buffalo School of Medicine This instruction, arranged by the Council Committee on Public Health and Education of the State Society, is presented as a cooperative endeavor between the Society and the State Department of Health

New York County

The role of the New York Academy of Medicine in medical progress in the last 100 years was described by Dr George Bachr, its recently re-elected president, in his address at the Academy on January He also spoke of the centennial year, observance of which begins March 6 with a dinner at the Waldorf-Astoria Hotel, at which Prof John A. Ryle, former Regius Professor of Medicine, Cambridge, England, and now head of the Institute of Social

Medicine at Oxford, will be the speaker

In his reference to the part played by the Academy in the century since its founding, Dr Baehr said that one can point with satisfaction to the masterly accomplishments of the institution in the reduction of maternal deaths, the establishment of a national quarantine service, the sanitation of cities, the abolition of the obsolete coroner system, the establishment and improvement of vital statistics, and the development of a standard nomenclature of disease that is now used in almost every medical school and hospital throughout the United States The Academy also played an important part, he said, in educating the public through the radio, the daily press, other publications, and laity lectures

Dr Baehr said that, with the help of the City Planning Commission, the Department of Hospitals, the United Hospital Fund, and the Hospital Council of Greater New York, a centennial celebration exthe older municipal and voluntary hospitals of the older municipal and voluntary hospitals of the city, at which plans for their post-war develop-ment will be shown. At this exhibit of hospitals, he said, a master plan for the future hospital development of Greater New York will be revealed to the medical profession and to the public for the first

fame

Dr Harrison H. Shoulders, president of the American Medical Association, was guest speaker at the meeting of the Society on January 27 Shoulders discussed recent developments in the evolution of the progressive policies and public relations technics of the national organization.

Rensselaer County

A nonprofit medical insurance plan, under which workers and their families may pay advance pre-miums for surgical and medical care in hospitals, was introduced in Rensselaer in February

Dr Stephen H. Curtis, representative from Rensselaer County and vice-president of the Northeastern New York Medical Service, Inc., declared recently that the estimated 200 physicians in the County have been sent application cards to join the

Approved by the American Medical Association and accepted by all county medical associations in the State, the plan is expected to become national in scope and is being instituted by physicians to fore-stall socialized medicine Known as NEMS, the service will have its office in Albany and will include the following counties Rensselaer, Saratoga, Albany, Schenectady, Clinton, Columbia, Essex, Fulton, Greene, Montgomery, Schoharie, Warren, and Washington.

Richmond County

Dr Nathan Sobel was the speaker at the January session of the Society's postgraduate series held in the US Marine Hospital Auditorium, Clifton, Staten Island His subject was "Diagnosis and Treatment of Common Skin Diseases"

Saratoga County

Governor Dewey on January 9 appointed Dr Frank A Mastrianni, Mechanicville, as coroner of Saratoga County to fill the vacancy caused by the death of Arthur W Johnson, Mechanicville

was a memoer of the American Medical Association, the State and County medical societies, and a Fel-low of the American Collego of Surgeons. Joseph A. Novelli, M.D., 54 of Brooklyn, died on January 14. He was graduated from the Fordham University Medical School in 1018. He was associate pediatrician to the Evangelical Deaconess Hospital in Brooklyn, and a member of the Ameri-can Medical Association, and the State and County

medical societies.
Ladislaus J Perenyi, M.D., 47, of Rockville
Centre, died on January 20 In 1923 Dr Perenyi
received his medical degree from New York Uni versity School of Medicins.

He was on the staffs of Polyclinic Hospital, New York, and of Mercy Hospital, Hempstead, and South Nassau Communities Hospital, Rockville

Centre.

He was a member of the American Medical Association, and the State and County medical socie-

George S. Price, M.D., of Fairport, died on January 18 For several years he had been treasurer of the New York State Health Officers Association. During the first World War he had served in the Army Medical Corps.

Dr Price had been a practicing physician in Fairport for more than fifty years and retired in

1944.

He was a member of the American Medical Association, the State and County medical societies, the Rochester Academy of Medicine, and associate of the staff of the Genesee Hospital, in Rochester He received his medical degree in 1892 from Eclectic Medical College, Cincinnati. He was 81 years old.

COLLEGE HEALTH CONFERENCE TO BE HELD IN NEW YORK CITY

Thirty-five leading organizations in health and education will sponsor the Third National Conference on Health in Colleges to be held in New York City May 7 to 10 1947.

The first meeting of its kind in more than ten years, the Conference is called to meet new health problems arising during the postwar period.

National organizations sponsoring the meeting include the Association of American Colleges, the American Association of Teachers Colleges the American Student Health Association, the Ameri can Association for Health, Physical Education and Recreation, and the National Health Council.

HOSPITAL NEWS

New York's Blue Cross Plan to Raise Rates and Increase Benefits

A SSOCIATED Hospital Service—New York's A Blue Cross Plan—will raise subscription charges to its members by about one third beginning May 1 as the result of a rise in hospital costs amounting to approximately 40 per cent, it has been announced by Louis H Pink, president At the same time, members will be given an improved contract with greater benefits in private rooms, an increase in the allowance for maternity care from \$60 to \$80, and the inclusion of penicillin and other benefits pre-viously granted as "dividends"

Instead of a daily cash allowance, members who occupy private rooms will be entitled to the service benefits now available in semiprivate accommoda-They will be required to pay only the difference between the hospital's charges for the room and an allowance of \$6 a day paid by Associated

Hospital Service

According to Mr Pink, the granting of service benefits to members who occupy private rooms will be particularly advantageous to persons in the lower income brackets "Many members in this category," he declared, "are compelled to occupy private rooms for medical reasons or because semiprivate accommodations are not available at the time of their hospitalization When the illness is simple, our allowance covers the major part of the bill. But when expensive drugs, use of the operating rooms, and other special services are required the hospital charges are often much more than the member can afford to pay The new contract will remedy this situation "

Mr Pink declared that the increased cost of hospital service makes it more necessary than ever for people to budget against the expense "If, in the future, costs should decrease," he said, "we will continue our policy of increasing benefits or we will reduce rates"

Monthly rates for group membership will be \$1 for an individual, \$2.20 for a husband and wife, and \$2 72 for a family The cost of nongroup membership will be \$1 20, \$2 50, and \$3 10 respectively

VA Makes Available More Hospital Beds for Veterans

The Veterans Administration is initiating a new program to make more beds available for veterans who have not been able to enter VA hospitals

because of bed shortages

Under the new program, the managers of the 11 VA hospitals in New York State are authorized to furlough patients whose treatment can be completed adequately out of the hospitals and thereby make the beds they would occupy available to other veterans also in need of hospitalization Thus, a greater number of veterans can be given medical care than previously was possible

The program divides the patients whose hospitalization may be shortened by this procedure into service-connected and nonservice-connected cases

Service-connected patients, whose disabilities have improved sufficiently to be treated elsewhere, will be discharged from VA hospitals and will re-

ceive outpatient treatment in VA hospital clinics or field stations, or on a fee basis "as circumstances warrant" Transportation for this treatment may be furnished at government expense

Nonservice-connected patients, who can be given final treatment on an outpatient basis, will be granted leaves of absence from VA hospitals but will continue to be carried on the hospital rolls as patients They then will report for treatment only in VA hospital clinics or field stations. The government will not pay transportation costs, or other expenses for this treatment, and will not provide treatment outside VA installations. lations

The program will apply only to those patients whose actual period of hospitalization may be shortened by this method, without prolonging treatment or impeding recovery

Newsy Notes

The children of the late Gertrude Vanderbilt Whitney, sculptor and founder of the Whitney Museum of Art, through a memorial subscription of \$94,200, have assured a complete obstetrical department for the new building of the North Country Community Hospital at Glen Cove, H Irving Pratt, chairman of the hospital's \$1,750,000 building fund, announced recently

Cornelius Vanderbilt Whitney and his sisters,
Mrs. G MacCoullouch Miller, and Mrs Barbara
Whitney Henry, made the gift in the name of the
Gertrude Vanderbilt Whitney Charitable Trust Fund, of which they are trustees The Whitney Memorial will be located on the first floor of one of the new wings of the enlarged hospital The building fund will not only double the size of the present hospital, but will create several new departments, modernize the present building, and increase the endowment fund *

A streamlined diagnostic clinic which was maugurated at the Mary Imogene Bassett Hospital, Cooperstown, late last summer has compressed the diagnosis of most cases into a single day's time, eliminating the usual series of return visits or lengthy stays by out-of-town patients

Proving highly successful, according to Dr Daniel H. Deyoe, superintendent of the Hospital, the new procedure is based on a total mobilization of all the hospital's medical, surgical, and technical staff for an intensive concentration on the patients whose cases are being studied.

All regular diagnostic tests are conducted as in other clinics, but the entire procedure is speeded up

^{*} Asterisk indicates that item is from a local newspaper

by the integration of the efforts of the entire staff from the hospital clerks to the chiefs of the various services.

Patients come in at 10 AM prepared to spend the The first hour is spent in getting records started and in taking basic laboratory tests. The next step is a detailed history and physical examination by one of the junior staff members.

When all this preliminary information is on hand the junior staff member then reviews the case with a senior physician or surgeon who suggests any further investigative procedures and arranges for the patient to see the necessary specialists within a few

ролля-Following the completion of this second phase of the studies, the case is again reviewed by the senior physician who integrates the findings, discusses them with the patient and prepares a report to be sent to the referring physician. All members of the staff are available for consultation at any time

during the period of the clinic The new procedure is an effort to improve on the schedules followed by the better known clinics in this country where examinations have been spread out over a number of days with the patient in the meantime living in hotel type of accommodations.

Residue of the estate of Dr John A Sampson who died December 23, will be placed in trust, after deduction of \$70 000 in specific bequests, and the income will be divided equally between Albany

Hospital and Albany Medical College.

The Sampson home at 244 Pawling Avenue, Troy, and 710 acres of land at Grafton are to go to Rensselser Polytechnic Institute. Williams College Dr Sampson's alma mater, is to receive \$1,000 for its loyalty fund. Various friends and charitable institutions are to receive bequests.*

Oswego County board of supervisors at their ninth and final day's session of the annual meeting on December 31 voted unanimously to establish three county laboratories, appropriating a \$75 000 fund to meet the cost of establishing and maintain

ing them during 1947
The laboratories will be situated at the Oswego
City Hospital Lee Memorial Hospital in Fulton and at the county tuberculosis sanatorium at Or well. These places were designated in 'view of the distribution of population the situation of hospitals and transportation facilities, according to the resolution adopted by the board.

The board also approved a request for a state aid

grant of \$7 500 toward initial equipmentand installa tion of the three laboratories as well as one of \$22,500 toward the maintenance of the three laboratories during 1947 This state aid for maintenance will not exceed half the actual cost of maintenance of

each laboratory for the year A board of managers for the three laboratories will be appointed at the next meeting, and shall consist of at least five members, two of whom shall be physicians fully licensed to practice in New York State.

The annual Maimonides Lecture under the auspices of the Clinical Society of the Beth El Hospital

was presented on February 13, at the Jewish Santarium and Hospital for Chronic Diseases, Brook lyn. Guest speaker was Dr Chester S Kiefer, chairman of Committee of Chemotherapy, and Other Agents of the National Research Council. His subject was 'Antibiotics in Chaical Medicine.

A clinic for the prevention of cancer in children was opened January 3 at Memorial Hospital New York City It is the first of its kind in this country Dr Harold Dargeon, one of the country's fore-

most experts in the field, is in charge.

Purpose of the clinic, he said, would be to ex amine apparently normal children up to 15 years of age to detect abnormalities, and, in particular, any evidence of cancer or related diseases.*

Final figures at the close of the year for the House of the Good Samaritan's new hospital campaign in Watertown were recently announced by Henry H. Babcock, general chairman Mr Babcock said that 2,790 subscriptions received to date amount to \$842,863 17 *

The North Country Community Hospital in Glen Cove is the first hospital in Nassau County to develop a complete chest survey service for both pa tients and personnel, and the hospital is a pioneer in this work in the United States, according to Dr Everett C. Jessup of Roslyn, chairman of the County Medical Society's subcommittee on tuberculous.

The initial step was taken in the summer of 1941 when all the physicians on the hospital staff had their own chests x rayed. Soon after chest x rays were required of all newly-employed personnel and in March 1943, an x-ray was required of all volunteers. Patients were offered this service at a reduced fee also *

At the Helm

Appointment of Dr Edward G Eschner of Ebenezer as acting director of the x-ray department of Meyer Memorial Hospital, Buffalo was

A graduate of the University of Buffalo, School of Medicine, Dr. Benher studied radiology at Temple University of Pennsylvania University and the University of Pennsylvania Homital at Dhiladalphia and the Presbyterian Hospital at Philadelphia, and the Presbyterian Hospital at New York. He was chief of the Army's 28d General Hospital x-ray service in Africa, Italy, and France.

Nowly appointed members of the active staff at Dansville General Hospital are Dr Charles Gullo, Dr Anderson V Vickers, Dr Gerald E. Murphy and Dr C. T Andolina, all of Mt. Morris.

Dr Stanley J Jackson also of Mt. Morris, was appointed to the courtesy staff, and Dr E. Willis Hainlen of the Mt. Morris Tuberculosis Hospital was named a member of the consulting staff.*

At the annual meeting of the board of directors of the Long Beach Memorial Hospital, Dr George Reiss was re-elected president, Herman Wood, first vice-president, Jack Green, treasurer, and Moe Kerman, secretary

A resident physician, Dr Hugh Reed has assumed duties at Corning Hospital, Dr C M Lapp, president of the hospital board, has announced

Dr Reed is a graduate of the medical school at Georgetown University He comes to Corning from Rochester through an arrangement with the Council of Rochester Region Hospitals Incorporated, Dr He is expected to remain about two months and will probably be succeeded by another man selected by the Council.

Dr Arthur S Moore, returing superintendent at Horton Memorial Hospital, Middletown, was guest of honor at a testimonial banquet at the The banquet was Mitchell Inn on December 21 given by the attending staff at the hospital.

Speakers included John G. Martin, superintendent

at St Barnabas Hospital, Newark, James Norris, of New York City, consultant for the Associated Hospital Service, and Judge Edmund C Faulkner, president of the Horton Board of Directors Dr Moore will take up duties as consultant for James

Hamilton & Associates, hospital consultants
Earl F Mitchell, of Lockport, has been named
superintendent to succeed Dr Moore Mr Mitchell, a layman and a veteran of twenty-four years in hospital administration, took over his new duties February 1 He was formerly superintendent of Lockport City Hospital.

Dr Gordon Meade, formerly of Rochester, has been named associate director of Trudeau Sana-

He replaces Dr Spencer Schwartz who left several weeks ago to accept a position in the Veter ans' Hospital at Drecksville, Cleveland, Ohio

Dr Meade will serve as an associate to Dr Edward N Packard, medical director of the sanatorium

Dr Ward H Cook has accepted a position as director of laboratory and pathologist at the Long Island College Hospital in Brooklyn Dr Cook recently resigned as director of the Yonkers Health Department's Bureau of Laboratories *

Evaluation of Disabilities

To the Editor

In an article entitled "The Evaluation of Disabilities," published in the November 1 issue of the NEW YORK STATE JOURNAL OF MEDICINE, the author gave percentage standards for computing so-called "Schedule Loss" He gave the impression that these standards are used by members of the medical division of the Workmen's Compensation I respectfully but firmly object similar paper read by me a few years ago, the percentage standard figures are mostly at variance with the eleven enumerated by Dr Leder checkup with the former chief medical examiner and his first assistant, whose life's work was devoted to successful evaluation methods throughout the State, corroborate my dissent

Picture the absurd setup of two injured workmen with the same type trauma and exactly the same end result sent into the medical division for final adjustment examination One will get \$1,435 less than the other, if the objected listed standard is followed and not the one set by Drs Lewy, Johnson, Schmitter et al Even carrier surgeons, some former State employees, agree that the listed percentage standard for rigid foot, namely 60 per cent, is much Similarly a workman would receive 10 per too low cent less or be deprived of \$683 20 if the examiner used the published standard for rigid rotary motion of the forearm. In like manner, 5 per cent less of the forearm In like manner, 5 per cent less for ankylosis of the knee, or in terms of money, \$403 20 There are other differences but sufficient has been mentioned to show that clarification is im-

Computation of schedule loss is the peculiar duty of the medical division of the Compensation Board In actual practice there is no appeal. Uniform basic standards within the division are manifestly needed for proper and just payments

should have no place here

It is my considered opinion that mathe-atical precise minimum standards can be matical matical precise minimum standards can be adopted for exact evaluation in these post-traumatic conditions. Of course, minor personal differences in regard to rating active and passive restriction and malingering will always occur. The present administration of Workmen's Compensation has real "reorganization" work to do here which will truly "expedite payments."

The author of the article in the Journal has confirmed his astrontics recently solely to schedule loss.

firmed his activities recently solely to schedule loss cases, thus apparently lending credence to the supposition that the present supervising powers ap-

prove the disputed percentage standards

Yours truly,
(Signed) WILLIAM J JACKSON, M D
Associate Compensation Examining Physician (1932 to date)

January 10, 1947

Comment

Why should there not be a more standardized procedure based upon experience over the years? would appreciate the views of our readers on how to evaluate disabilities more scientifically and equitably

-Editor

WOMAN'S AUXILIARY

TO THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

The mid winter meeting of the Executive Board of the Woman's Auxiliary to the Medical Society of the State of New York was held at the Hotel Rocee-

vel, New York City, January 23 and 24, 1047
Mrs. Alfred L. Madden, State President, called
the meeting to order at 1 30 r.m., and greeted all
present. The roll call was taken by Mrs. John J
Rainey, recording secretary

Following the acceptance of the agenda, the Pledge of Allemance and the Collect was given in unison. The minutes of the October meeting were read and

approved.

A luncheon of the Auxiliary was held in the Georgian Room of Hotel Statler on January 28 Guests were the president of the County Medical Society, Dr Arthur F Glaeser, and members of the Advisory Board Dr A H. Aaron, Dr Herbert H. Bauckus, Dr Carlton E Wertz, Dr Alfred H. Nochren and Dr Helen G. Weller.

Bauckus, Dr Cariton E Wertz, Dr Aired H. Noehren, and Dr Helen G Walker Mrs Arthur L Bennett, newly elected president of Eric County, has made her appointments as follows

Mrs Stuart A Good—membership, Mrs Clarence J Durshordwe—program, Mrs Lawrence J Radice—public Health and Hygera, Mrs Thurber LeWin—project, Mrs John J Maisel—economics and public relations, Mrs Thomas F Houston—legislative, Mrs Arthur C Hassenfratz—house and hospitality, Mrs Wade B Ellis—press and publicity, Mrs Fred St John Hoffman—historian and parliamentarian, Mrs Robert W Lipsett—national bulletin, and Mrs George F Marquis—telephone

A decline in physical activity and mental alertness may be due to any one of a variety of factors such as climacteric changes natural aging, or anemia When the metabolism test and clinical picture indicate that the disturbance is of thy roid origin, the selection of thyroid medication becomes important Medici nal thyroid may vary greatly for there is a marked regional and seasonal variation in natural animal thyroid substance Armour scientists working with the U S Public Health Service demonstrated this variation years ago and instituted meth ods of blending and assaying thyroid glands to fixed standards in order to achieve the greatest possible uniformity of potency

The Armour Laboratories, satisfied only with the best in glandular products

is still actively engaged in research on thyroid For example, Armour has in troduced recently a new method of assay for thyroid by metabolic studies on guinea pigs to assure greater uni formity of potency in finished products

Have confidence in the preparation you prescribe—specify "ARMOUR"

Supplied in 1/10, 1/2 1/2, 1 2 and 5 grain tablets, plain and enteric coated and in powder U S P

Privileged Communications

THE following is an austration of a document of question of privileged communications handed "HE following is an abstract of a decision on the down by the Supreme Court of Oklahoma, which appeared in the Journal of the American Medical Association, November 23, 1946

Privileged Communications Physician's Report to Insurer -Plaintiff obtained an award for an industrial injury, the award being against the defendant Subsequently the insurance insurance company carrier filed a motion to reopen the case and discontinue payments on the award Attached to this motion was a physician's report as required by the Workmen's Compensation Act On the theory that this report was libelous, the plaintiff filed suit for damages against the insurance company and obtained judgment in the trial court, from which judgment the defendant appealed to the Supreme Court of Oklahoma.

The physician's report, in the form of a letter addressed to the manager for the insurance carrier, stated among other things that in his opinion the plaintiff evaggerated his condition and appeared to be in good health, suffering from no disability and able to do light work. The report then contained

this paragraph

This patient has had a positive Wassermann test on two previous occasions, a positive Wassermann test was obtained during my treatment. He was given several shots of Mapharsen and seemed to improve but he absolutely refused further Luetic treatment because it made him sick. He flatly refused to have a spinal puncture done to determine his Wassermann reaction and colloidal curves for Lues.

The plaintiff contended that the statement was libelous and was not relevant and pertinent to the issue involved in the proceeding to discontinue compensation, whereas the defendant contended that the statement was absolutely privileged.

The Oklahoma statute (12 O S 1941 section 1443)

provides

A privileged publication or communication is one made First. In any legislative or judicial proceeding or any other proceeding authorised by law. No publication which under this section, would be privileged, shall be punishable as libel

Furthermore, rule 17 of the state industrial commission provides

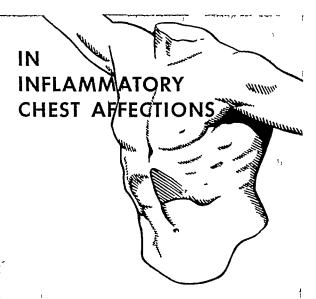

The Commission will not consider nor set for hearing any motion to discontinue payment of compensation ordered unless such motion to discontinue compensation sets up sufficient grounds supported by a physician s report.

It is clear, said the Supreme Court, that a proceeding before the state industrial commission is a "proceeding authorized by law" within the purview of section 1443 It is also clear that it is proper and necessary to file a physician's report with a motion to discontinue compensation under rule 17 "Bearing in mind the foregoing rules, we are of the opinion, and hold," said the court, "that the statement here complained of was pertinent to the question raised by the motion to discontinue compensation." The motion contained the allegation that the claimant "is able to return to ordinary manual labor and is entitled to no further compensation" by reason of the injury The physician's report tended to sus-tain such allegation. If the disability was due en-tirely to syphilis, the court continued, the insurance carrier was not liable for further compensation. And, since the matter complained of was filed as a part of the pleading in the case, the question as to whether the matter was pertinent or relevant was one for the court to determine as a matter of law and not one to be submitted to the jury The court accordingly concluded that the matter complained of was absolutely privileged, that a question of its being false or made with malice was immaterial, and ruled the judgment in favor of the plaintiff be reversed — Pacific Employers Insurance Company v Adams, 168 P (2d) 105 (Ölla , 1946)

CORNELL UNIVERSITY MEDICAL COLLEGE ALUMNI ASSOCIATION, INC

The Annual Alumni Day for the Cornell University Medical College will be held this year on March 13, at the College It will include registration in the morning, with luncheon at the nurses' residence,

to be followed by the business meeting and a schedule of rounds and conferences in all departments Dinner will be served at the Hotel Roosevelt, and dancing will conclude the day

REVIEWED

A Handbook on Diseases of Children Including Dietetics and the Common Fevers By Bruce Wilhamson, M D Fourth edition. Duodecimo of 388 pages, illustrated Baltimore, Williams & Wilkins Co , 1945 Cloth, \$4 50

This well-knit compendium on the diseases of children covers the field of pediatrics, contagion, and nutrition in a condensed, yet complete manner

The main stress is put on the description of the [Continued on page 416]

[Continued from page 414]

various diseases, with a short note as to treatment The book is written in an easy reading style and will be found of interest to both pediatrician and student

MARK J WALLFIELD

The Effect of Smallpox on the Destiny of the Amerindian By E Wagner Stearn, Ph D, and Allen E Stearn, Ph D Octavo of 153 pages Boston, Bruce Humphries, 1945 Cloth, \$2 50

The authors seem to have collected and utilized everything that has been written about the relations of the Indians to this disease They have certainly demonstrated the serious effect on their existence The references are precisely stated Anyone wishing to prove the truth of the contention can do so through this book and can, from the source material referred to, secure more detail, if he so desires

WALTER D LUDLUM

Electrocardiography Including an Atlas of Electrocardiograms By Louis N Katz, M D Second edition Quarto of 883 pages, illustrated Philadelphia, Lea & Febiger, 1946 Cloth, \$12

In the second enlarged and revised edition of this medical classic several new chapters have been added and some theories of questionable practical value have been deleted The chapter on coronary thrombosis bulks large, but the importance of the subject

makes a complete and detailed analysis essential.

We agree with the author that an abnormal tracing is positive evidence of cardiac disturbance, whereas a normal tracing does not exclude the possibility of cardiac damage. We see no advantage in substituting left axis shift for left axis deviation Left and right cardiac strain and coronary insufficiency are of distinct advantage and are terms in common usage at the present time On the whole, this volume is a valuable addition to the library of a physician at a time when heart disease is captain of the men of death.

SIMON FRUCHT

Exercises in Electrocardiographic Interpretation By Louis N Katz, M D Second edition Quarto of 288 pages, illustrated. Philadelphia, Lea & Febiger, 1946 Cloth, \$6 00

Exercises in Electrocardiographic Interpretation is a postgraduate course for the practitioner who has mastered the rudiments of electrocardiography enables the advanced student to test his knowledge and to correlate his findings with the clinical history of the patient and occasionally to follow through his first impressions with one or more follow-up All types of electrocardiograms are presented and their interpretation carefully analyzed The illustrations are clear and distinct The value of serial tracings for confirmation is stressed repeatedly There is, however, one fault that the reviewer would like to see corrected, if possible The abnormal findings would be more clearly listed if they were tabulated for each lead separately, so that the reader could go from the tracing to the interpretation without going through the text a number of times This book is a great help in the understanding of the electrocardiogram

SIMON FRUCHT

The Modern Attack on Tuberculosis By Henry D Chadwick, M D, and Alton S Pope, M D Re-

Octavo of 134 pages vised edition New York.

Commonwealth Fund, 1946 Cloth, S1 00

This revised edition of The Modern Attack on Tuberculous by Dr Chadwick and Dr Pope well measures up to the high standard achieved by the first edition More new material has been added in the way of recent developments in administrative practice, and in the technic of tuberculosis case finding and control—also, a new evaluation of the role played by photofluorography in mass x-ray examinations in industry and other population groups has been added

To those interested in the epidemiologic aspects of the tuberculosis problems, this little book should

prove invaluable

FOSTER MURRAY

Pneumoperitoneum Treatment. By Andrew Ladislaus Banyai, M D Octavo of 376 pages, illustrated St Louis, C V Mosby Co, 1946 Cloth, \$6 50

Pneumoperatoneum as a therapeutic procedure has been known to the medical profession for over fifty years, and in this volume Banyai brings to-

gether a wealth of data on this procedure

The volume is well written and well illustrated although one wonders why no illustration of pneumoperitoneum technic is presented, for one picture is better than a thousand words. There are numerous references, international in scope, and many communications from workers in Europe, Asia, Central and South America, which marshal convincing data on the proper value and use of this procedure The book is worthwhile reading, especially by chest physicians, for they will be able to revaluate their own experiences in the light of Banyai's sixteen years' devotion to this type of therapy

HERMAN E WIRTH

Public Health the American Way By H B Anderson Octavo of 238 pages New York, Citizens Medical Reference Bureau, Inc., 1945 New York, Cloth, \$2 50

This book attempts to show that any scheme for compulsory health insurance would infringe upon the liberty of the American people by "circumventing the principles laid down in the bill of rights"

B M BERNSTEIN

Diseases of the Retina By Herman Elwyn, M D Octavo of 587 pages, illustrated delphia, Blakiston Co, 1946 Cloth, \$10 Phila-

This work of Elwyn can find a welcome spot on the bookshelves of ophthalmologists and interns as it gives clear and well-authenticated descriptions of a great number of retinal entities and relates the ophthalmoscope picture with the changes as seen with the microscope The illustrations are well chosen and clearly reproduced Each chapter is very well documented and the ideas expressed are in keeping with the progress of the subject

The only suggestions the reviewer can make is that more detailed descriptions would be helpful and that more space could have been devoted to a discussion of the basic anatomy and physiology

It is hoped that Dr Elwyn will produce a second volume on the choroid so that one may use the work as a descriptive text of all eyeground problems and not just the one limited to the retina

JOHN N EVANS

[Continued on page 418]

Allergic or Infectious?

Whatever the etiology of the condition, the patient is interested only in relief ARLCAPS* brings rapid symptomatic relief of nasal congestion, sneezing, and the itching of nose or eyes which accompany coryza. Often, relief is obtained soon after administration of the first capsule.

ARLCAPS acts synergistically through a combination of ephedrine hydrochloride phenobarbital and aspirin, together with tartar emetic and potassium nitrate.

DOSAGE One 3 or 5-grain capsule night and morning, depending upon individual tolerance, while symptoms persist. Use with caution in diabetes, cardiovascular disease or thyroid disorders.

*The word ARLCAPS is a registered trademerk of The Artington Chemical Common v

[Continued from page 416]

Women in Industry Their Health and Efficiency Issued under the By Anna M Baetjer, Sc D auspices of the Division of Medical Sciences and the Division of Engineering and Industrial Research of the National Research Council Octavo of 344 pages, illustrated Philadelphia, W B Saunders Co, 1946 Cloth, \$4 00

This book is well written and answers many problems and questions arising out of large scale employment of women in industry It would be well for every physician interested in industrial medicine

and in problems arising therefrom to read it

IRVING GREENFIELD

German for the Scientist (Chemist and Physicist) By Peter F Wiener With additional sections by Duodecimo of 238 pages Paul Spoerri, Ph D Brooklyn, Chemical Publishing Co, 1946 \$3 50

This little book is suitable for scientific workers who are unable to attend classes and yet wish to acquire a reading knowledge of German author wants to enable the user to extract the essential meaning of a scientific test or article without too much waste of time The book is built upon a good and long practical teaching experience
The passages in chemistry and physics are very

well chosen The student who has learned to digest them correctly, will certainly be able to overcome any linguistic difficulty

418

MAX G BERLINER

Demonstrations of Operative Surgery for Nurses By Hamilton Bailey, F.R.C.S. (Eng.) Octavo of 348 pages, illustrated Baltimore, Williams & Wilkins Co, 1945 Cloth, \$5 50

The demonstrations and illustrations in this book are very clear and well done, although many of the technics are rather out of date for this country This book is splendid for both interns and medical students entering the field of surgery, but is not a good reference book for student nurses, as it is too advanced

A table of contents would help the reader to get acquainted with the material Part of the book is written in the first person which seems strange for a textbook. Suggested readings and a bibliography would add to the book. The book should prove very helpful to a nurse teaching surgery

MARIE M BEHLEN

Mother and Baby Care in Pictures By Louise Third edition Octavo of 203 Philadelphia, J B Lippincott Zabriskie, R N pages, illustrated

Co, 1946 Board, \$2 00
The author has written a simple and well-illustrated book for expectant mothers and fathers The subjects covered include prenatal care, physiology of labor, aftercare of the mother and baby, and development of the baby for the first year of life. The book is authoritative and has been used in nursing education

There are 229 illustrations, principally photographs, which in themselves clearly explain the subject matter. Pictures from Dr. Robert L. Dickin-

son's Birth Atlas are included

This revision places emphasis on nutrition, the mechanism of labor, and the care of the baby

The book is clearly one of the best available to the laity and should be most helpful to prospective

parents ALEXANDER H. ROSENTHAL

The Early Diagnosis of the Acute Abdomen. By Zachary Cope, M.D. Ninth edition Octavo of 262 pages, illustrated. New York, Oxford University Press, 1946 Cloth, \$3 75

This little volume continues its excellent style of presentation and is, in general, rather complete in its differential diagnosis of disturbances which present themselves to the doctor However, it appears that several rather important conditions in the acute abdomen such as ileitis, ruptured graafian follicle, perforation in ulcerative colitis and Meckel's diverticulitis, have been overlooked in the author's discussion of acute appendicitis

Also, the increase in blood amylase in acute pancreatitis does not appear in the text, nor does any reference to blood chemistry in acute intestinal ob-

struction.

Such omissions should be rectified at the earliest possible date, if completeness is to be achieved

B M. Bernstein

Renal Diseases. By E T Bell, M D Octavo of 434 pages, illustrated Philadelphia, Lea & Febiger, 1946 Cloth, \$7 00

This most excellent, compact and scientific monograph covers fully the entire field of renal diseases from anomalies and obstructive uropathies to all the nephritides, neoplasms, as well as related diseases of the blood-vascular system and metabolic disorders

It represents the true modern method of presentation of clinical pathology and includes references at the end of each chapter—It is fully illustrated by 115 engravings and four color plates, also numerous tables. The rationale of treatment is also given

This is one of the finest books that has come to the reviewer's attention. A feature is the fostering of fuller cooperation between the pathologist and the

clinician

The work should be on the shelf of the urologist, practitioner, and surgeon, as well as medical student, for ready reference In fact, it could well serve as a text for undergraduates in medical school

AUGUSTUS HARRIS

A Manual of Tuberculosis. Clinical and Ad-By E Ashworth Underwood, M D ministrative Third edition. Duodecimo of 524 pages, illustrated. Baltimore, Williams & Wilkins Co, 1945 Cloth,

The third edition of this manual has been extensively revised, rewritten, and rearranged in order to present the many aspects of tuberculosis more com-prehensively This accounts for the change in title Many new chapters have been added These concern the evolution of tuberculosis, allergy, and immunity as related to tuberculosis, x-rays, and mass radiography, mental aspects of this disease, routine methods employed in the clinical laboratory, social medicine, and tuberculosis, and tuberculosis in its relation to war All the chapters on the clinical approach have been retained and the work as a whole gives a good bird's-eye view of the tuberculosis prob-lem as it exists in England and Wales and methods projected to adequately solve this important prob-

The manual is written in simple style, well illustrated, and is a source of helpful advice for those confronted with the practicable phases of tubercu-

losis control.

Bowel Hygiene and Modern Living-

High speed living - the cause of increased nervous tension, inadequate diet, variable eating hours and irregular bowel habits—is a product of the machine age, producing an increase in irritability of the digestive tract which often results in constipation

STREPTOMYCIN NOW IS AVAILABLE

Physicians now may obtain adequate supplies of this remarkable new antibacterial agent, without restriction, from their local pharmacists and hospitals

CLINICAL INDICATIONS

Streptomycin is effective in the treatment of Urmary Tract Infections, Bac teremia, and Meningitis due to susceptible strains of the following organisms

Esch. coli Proteus vulgaris

B lactis aerogenes Klebsiella pneumoniae (Friedfönder a bodilus)

TULAREMIA All H influenzae infections

Streptomycin is a helpful agent also in the treatment of the following diseases, but its position has not been clearly defined

Peritonitis due to susceptible organisms Pneumonia due to Klebsiella pneumoniae (Friedländer s bacillus)

Liver abscesses due to streptomycin-sensitive bacilli

Cholangitis due to susceptible pathogens

Endocarditis caused by penicillin-resistant,

streptomycin-sensitive organisms

Chronic pulmonary infections predominantly due to streptomycin-sensitive flora

Empyema due to susceptible organisms

Reliability of contraceptive action...freedom from fritation and fine esthetic qualities have made Ortho Gynol the most widely prescribed contraceptive preparation

Orthor-Cypnol is instantaneously spermicidal. It has a buffered acidity to conform to the normal vasinal pH—is readily miscible with vasinal secretions and season -and is sale to use over long periods because of uniform stability and freedom from irritation. Ortho-Cynol is available with and without the Ortho measured dose applicator

> It is usually prescribed in conjunction with the Ortho Disphragh. Active ingredients: Ricinoleic acid 0.7%, boric acid 3.0% and oxyquinoline sullate 0 026%.

for Decongestion without Rebound

.... Follow the ARGYROL Technique in treating Para-nasal Infection

In the recent literature, reports are multiplying on the frequency of rebound congestion following use of many vasoconstrictors. This vicious circle of vasoconstriction and compensatory congestion is avoided with the use of ARGYROL, which produces no such effect, and restoration of normal function is more readily attained

The ARGYROL Technique

- 1 The nasal meatus by 20 per cent ARGYROL instillations through the nasolacrimal duct.
- 2 The nasal passages with 10 per cent ARGYROL solution in drops
- **3** The nasal cavities with 10 per cent ARGYROL by nasal tamponage

Its 3-Fold Effect

- 1 Decongests without irritation to the membrane and without ciliary injury
- 2 Definitely bacteriostatic, yet non toxic to tissue
- 3 Cleanses and stimulates secretion, thereby enhancing Nature's own first line of defense

Made only A C BARNES COMPANY • NEW BRUNSWICK, N. J.

Trauma and Nitrogen Equilibrium

Recent recognition of the direct relationship between trauma and protein loss has greatly improved the prognosis in postsurgical and post-trauma patients

Striking and hitherto unsuspected protein loss has been observed in patients with fractures Excessive urinary nitrogen excretion reaches its maximal point about a week after the injury is sustained, and thereafter slowly diminishes in extent, so that nitrogen balance is restored in approximately four weeks 1

In patients sustaining severe burns, the daily protein loss may be equivalent to 400 cc. of plasma 2

In a study embracing 23 burned patients, nitrogen balance determinations revealed excessive urinary nitrogen excretion. Nearly all patients were in negative nitrogen balance which was most marked during the first ten days ³

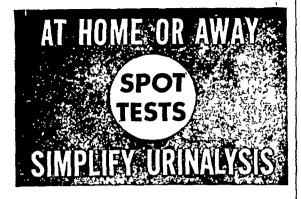

It thus appears that protein destruction and loss are prominent and potentially detrimental sequelae of trauma, and that every effort must be made to restore nitrogen equilibrium as quickly as possible to prevent the many deleterious consequences of protein depletion. The recommendation has been voiced that "whenever possible, protein losses or deficiencies should be corrected by oral feeding."

Among the protein foods of man, meat ranks high not only because of the generous supply of protein it provides, but also because its protein supplies all the essential amino acids, making it applicable for every protein need—growth, tissue maintenance, and tissue repair

FOR DETECTION OF ACETONE IN THE URINE

SAME SIMPLE TECHNIQUE FOR BOTH

A LITTLE URINE

COLOR REACTION IMMEDIATELY

A carrying case containing one vial of Acetone Test (Denco) and one vial of Galatest is now available. This is very convenient for the medical bag or for the diabetic patient. The case also contains a medicine dropper and a Galatest color chart. This handy kit or refills of Acetone Test (Denco) and Galatest are obtainable at all prescription pharmacies and surgical supply houses

stable tyrothricin

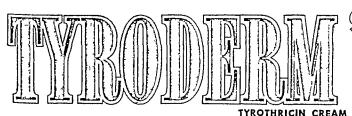

in ointment form!

"TYRODERM Tyrothricin Cream is particularly designed for treatment of a variety of skin infections. Developed by the Medical Research Division of Sharp & Dohme it contains 0.5 mg (500 micrograms) of stable tyrothricin per gram in a special emollient base. • The tyrothricin present in TYRODERM Tyrothricin Cream is stable

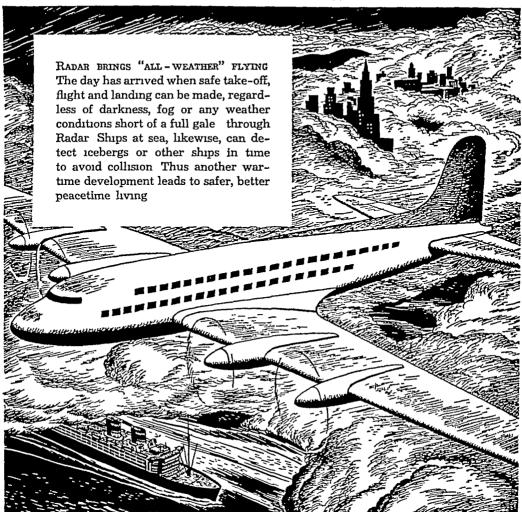

exhibits approximately the same range of bacterial specificity as penicitin remains in contact with site of application for a prolonged period of time—acts promptly—TYRODERM Tyrothricin Cream is indicated in the treatment of pyodermatoses such as acree vulgaris, impetigo dermatitis vegetans, infectious eczematoid dermatitis, and other dermatoses caused by gram positive organisms. It is also useful in the treatment of varicose decubital and ischemic ulcers, selected accessible postsurgical wounds and minor second and third degree burns. Sharp & Dohme Philadelphia 1 Pa

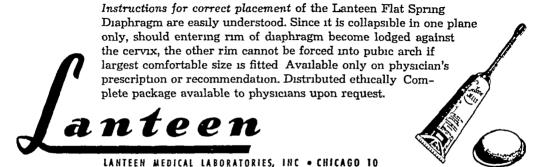

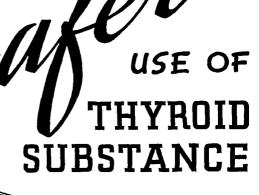

Supplied in 1-oz. tubes and 1 lb [ars.

Toward a Better World

An advance is also being made toward future sociological betterment by Lanteen Medical Laboratories' promotion of Lanteen products. These leaders in their field are produced under the most rigid scientific standards.

Serious disturbances may result from moderate doses of thyroid unless an adequate intake of the B Vitamins is assured (1, 2, 3, 4, 5). A relative hypovitaminosis is produced with loss of appetite and the occurrence of katabolic destructive changes in the animal organism.

PANTABEEROID Tablets contain thyroid with liberal amount of all the B ritamins, so that the supply of the latter is rendered adequate even with minimal thyroid dosage

IT IS TO BE BORNE IN MIND THAT THE PRESENCE OF THE B VITAMINS DOES NOT ELIMINATE THE NECESSITY FOR CARE FUL ADJUSTMENT OF THYROID DOSAGE

THYROID PLUS "B" COMPLEX

A revolutionary

advance

in the

treatment of

cough

ESKAY'S ORALATOR, an oral inhaler, applies an entirely new principle to the treatment of cough

The Oralator contains a remarkable new anesthetic-analgesic compound—
2-amino-6-methylheptane, S K F
The vapor of this compound is carried by inhalation directly to the principal zone (see illustration) where the cough reflex originates
There it checks cough almost instantaneously

by local action at the periphery

The effectiveness of

Eskay's Oralator

has been established by extensive clinical trials

77% of the patients were benefited

Smith, Kline & French Laboratories, Philadelphia, Pa

The advice is always "SEE YOUR DOCTOR"

For over 18 years, Parke, Davis & Company has conducted an educational advertising campaign in behalf of the medical profession—teaching the importance of prompt and proper medical care Now appearing in color in LIFE and other leading magazines, these "See your doctor" messages reach an audience of more than 23 million people.

Some things you should know about heart disease

No. 202 in a series of messages from Parkis Gavis & Ca. on the importance of prompt and proper medical care

IT is true that heart disease is the greatest single cause of death in this country

But it is not true as many people think, that heart disease must automatically cut short your life or make you an invalid.

A common type of heart disease-the so-called functional type-is not actually heart disease at all It is the reflection of some other usually correctable, disturbance in the body. It is often merely a temporary condition. It does not alter the heart itself, nor does it shorten life.

Even organic heart disease which ac tually changes the heart's structure need not be a serious disability. The handicap it imposes on a normal life will vary widely with the nature of the disease and the individual case

Symptoms are no indication of the seri ousness of a heart condition.

Two men may have identical symptoms One man's heart condition may dictate a careful limitation of his activities. The other man may be able to live a normal life span with only slight restrictions on his coas of lange

Medical science during the past few years has made great progress in under

standing the nature of heart disease and in developing new methods of prevention and treatment

Doctors today by proper treatment of theumatic fever in children, prevent many

future cases of heart disease. And doctors can also cure some cases of disease which would have been cons hopeless a few years ago.

There is for instance a kind of lea ease known as subacute bacterial endoci A few years ago doctors were help combatting what was practically alfatal infection. But now through the penicillin, an increasing number of are being successfully treated

Other drugs help your doctor to re the action of an irregular heart and duce the strains that are put upon i

And his modern knowledge of di vitamins, and the prevention of a and acute respiratory infections give other weapons to use against progi heart disease,

SEE YOUR DOCTOR. If at any tim find yourself wondering "Is there thing wrong with my heart? doctor at once.

If he finds your heart in good conan enormous load will be lifted fron mind And if something should be v your doctor a prompt diagnosis and ment give you the best chance for h long and normal life.

Makers of medicines prescribed by physicians

To these advantages may be added the emotional uplift or feeling of well-being which is so ofter encountered in the potient following therapy with "Premarin." This aspect is being favorable commented upon by an increasing number of clinicians.

To permit flexibility of dosage and enable the physician to fit estrogenic therapy to the particula needs of the patient "Premarin is supplied in two potencies."

Tablets of 125 mg — bottles of 20 100 and 1000
Tablets of 0.625 mg — bottles of 100 and 1000
Liquid-containing 0.625 mg in each 4 cc.
(one teaspoonful) — bottles of 120 cc.

REXALL FOR RELIABILITY

The barber pole is a relic of the middle ages, when barbers professed also to be surgeons and dentists. The pole was originally a red staff, wrapped with removable bandages, hung with dental instruments and topped by a brass lathering bowl. Later, as a concession to sanitation (or possibly to prevent theft), bowl, bandages and instruments were replaced by a painted replica.

The familiar blue and white Rexall sign is a modern symbol of superior and dependable pharmacal service. There are more than 10,000 independent, reliable drug stores, conveniently located throughout the country, which display this sign. It assures you of drugs laboratory checked for purity and uniformity under the rigid Rexall system of controls—and of selected pharmacal ability in compounding them.

why Dexedrine is so beneficial in menstrual dysfunction

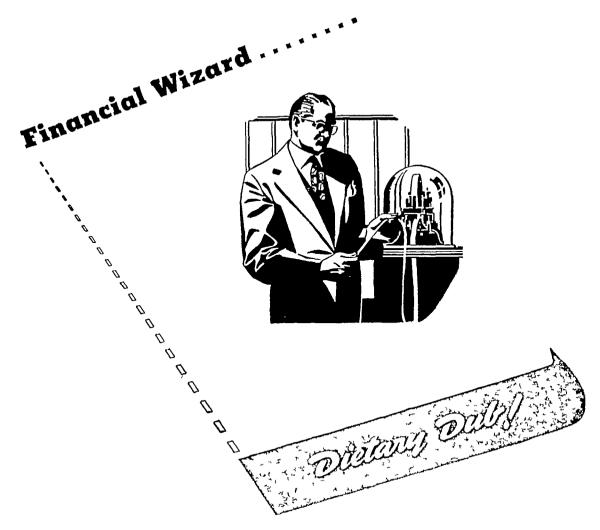

"The Central Nervous Stimulant of Choice"

Dexedrine therapy not only alleviates

the mental depression and psychogenic fatigue which ordinarily accompany dysmenorrhea, but also, through its marked amelioration of mood, beneficially alters the patient's reaction to pain Smith, Kline & French Laboratories Philadelphia, Pa-

Dexedrine Sulfate tablets

(dextro-amphetamine sulfate, S.K.F.)

He may not be one of your patients, but you know his dietary counterparts Men—and women—too deeply immersed in "important" affairs to take time to eat properly With them, scanty breakfasts and hasty, badly balanced lunches are the rule, dinners which fail to compensate for the defects of earlier meals, far from uncommon The in evitable result is an increase in the ranks of the self made victims of borderline vitamin deficiency. You know them the ignorant and indifferent, food faddists, persons on self imposed and badly balanced reducing diets, alcoholics, excessive smokers and many others • You know, too, that

since the bodily reserves of the vitamin B complex group are not large, even in patients whose diets are good, the more frequent results are deficien cies of the B factors • This is one of the three important reasons why we think you will wish to know about Surbex, a pleasant tasting, high potency vitamin B complex tablet. An even more important consideration is that Surbex contains all of the B complex factors in therapeutic amounts. The third reason is the availability of Surbex to your patients through good pharmacies everywhere Remember the name, Surbex Abbott Laboratories, North Chicago, Illinois

EACH TABLET CONTAINS:
Thiamine Hydrochloride, 6 mg; Riboflavin 6 mg;
Nicotinamide, 30 mg, Pyridoxine Hydrochloride 1 mg;
Pantothenic Acid (as calcium pantothenate) 10 mg;
Liver Concentrate * 5 grs
and Brewer's Yeast, Dried, * 2½ grs.
*For other B complex factors.

"Disposed" to Hypochromic Anemia

Nutritional Deficiency

'During growth, pregnancy and menstruation increased intake (of iron) is necessary. If any condition interferes with absorption, there will be a deficiency of iron for the manufacture of hemoglobin. *

The frequency with which in women hypochromic anemia is associated with nutritional deficiencies (promoted by finicky appetite poor absorption gastrointestinal upset) suggests the need for combining hemoglobin regeneration therapy with B-complex reinforcement.

Licuron B—the bi active antianemic—provides folic acid choline and other B complex factors as present in liver augmented by the crystalline vitamins thamine ribofiavin and niacinamide.

Licuron-B acts rapidly to restore hemoglobin to normal while concurrently it raises the patient s nutritional status.

Sugar-coated tablets in bottles of 100 500 1000

CLAIMS

VS.

DIFFERENCES

WHAT value have claims of superiority unless there is a difference in formula or process to justify such claims?

Take cigarettes for example

PHILIP MORRIS Cigarettes are <u>made</u> differently In the clinic as well as in the laboratory, the <u>advantages</u> of Philip Morris have been repeatedly observed, repeatedly reported by <u>recognized authorities</u> in leading medical journals Yes, Philip Morris <u>claims</u> superiority <u>and that superiority</u> <u>has been proved</u>*

May we suggest that your patients suffering from irritation of the nose and throat due to smoking change to Philip Morris—the one cigarette proved definitely less irritating

PHILIP MORRIS

PHILIP MORRIS & Co, Ltd, Inc, 119 Fifth Avenue, N Y.

*Laryngoscope, Feb. 1935, Vol. XLV, No. 2, 149 154 Laryngoscope, Jan. 1937, Vol. XLVII. No. 1, 58 60 Proc Soc Exp Biol and Med., 1934, 32, 241 N Y State Journ Med., Vol. 35, 61 35, No. 11, 590 592

TO THE DOCTOR WHO SMOKES A PIPE We suggest an unusually fine new blend—COUNTRY DOCTOR PIPE MIXTURE Made by the same process as used in the manufacture of Philip Morris Cigarettes.

And now Beech-Nut introduces VEGETABLES with BACON

A flavor most babics enjoy

Most babies like the taste of bacon This new Beech Nut food has a pronounced bacon flavor It is a tempting combination of good wholesome foods contributing to a good diet for bables.

Hom it is made

Fine bacon is ground and mixed with choice vegetables. All are then strained, vacuum pressure-cooked and sealed in glass jars for final processing

What it is made of

Water, carrots tomato purée, bacon pota toes, milk, rice, barley, celery, onions, and salt Ingredients listed in order of decreasing amounts

PACKED IN GLASS A most important fact to remember when you recom mend baby foods to mothers

Beech-Nut

Foods for Babies

CONTRACTOR TERMINATED THE MANAGE

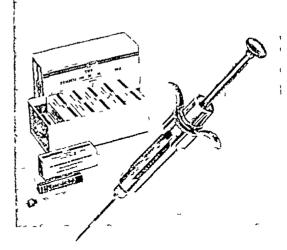

In many varieties of vegetables, meat combinations, soups, desserts and fruits.

PENICILLIN ADMINISTRATION

is safe, simple, and fast with TUBEX®

Before injecting aspirate to insure that needle is not in a blood vessel

- Designed for immediate injection no transfer from ampul to syringe
- Administration is rapid—300,000 units injected in less than 30 seconds
- Tubex has a special safety feature—by aspirating, it is easy to make certain that a blood vessel has not been entered
- Positive plunger of the syringe eliminates awkward administration

Prolonged therapeutic blood levels (12 to 24 hours) have frequently been observed after a single injection of 300,000 units. Nearly all cases of acute gonorrhea are cleared up by a single injection. Other susceptible coccal infections respond to one or two injections per day

Available in 1 cc Tubex, 300,000 units of penicillin calcium, with Tubex needle (20 gauge, 1½ inch) The Tubex syringe is supplied separately

Tubex syringes and needles, developed and produced by J Bishop & Co. are used exclusively by Wyeth Incorporated

TUBEX PENICILLIN in OIL and WAX

Editorial

Important Information for Physicians

Veterans' Medical Service

In this issue on page 510 will be found a highly important report to the 27,000 doctors of this State who are eligible participants in the veterans' medical service care plan. The report contains suggestions regarding procedure to be followed when reporting medical care given to veterans.

The Veterans Administration has made every effort to speed and facilitate the authorization of treatment, has reduced the paper work and "red tape" to a minimum, but can only depend on the doctors rendering the treatment for prompt, correct, and adequate completion of the simplified report forms If these are promptly completed and returned, payment for services rendered will be prompt.

The report tells in detail what to do as well as what not to do Careful reading will aid participating doctors of the State in the avoidance of errors Needless delays will thus be avoided to everybody's satisfaction

A word from the Editors of this JOURNAL to physicians participating in the medical service care plan for veterans' service-connected disabilities

 Service connection must be established by the Veterans Administration before treatment can be authorized (2) After authorization reports must be filed promptly for services rendered (3) Changes in procedure may be made from time to time (4) The Editors will attempt to publish information concerning these changes when they are made, as rapidly as possible for the guidance of participating doctors. (5) It is therefore highly important that all doctors in the State read the editorial section in each issue, and also the special department in the JOURNAL devoted to veterans' medical care Preserve your Journals containing this information.

Read carefully the extensive report The fee schedule will be circulated at a later date

Costs of Illness

Repeatedly in these columns we have commented on the threat to high quality, moderately priced, modern medical service which is inherent in the increasing unionization of the nonmedical ancillary services ¹

The continuity and cost both direct and indirect of these nonmedical but essential supportive services are vital. Their continuity is the life line of the helpless sick, their cost is the largest item entering into the complex thing that is modern medical service. Professional medical fees are a relatively minor item.

It is doubtful whether the public, even when it is economy minded, troubles to analyze carefully the thing it refers to broadly as "medical care" Because the public does not usually dissect carefully the phrases it employs, there is created an assumption that "medical care" refers to the professional medical services of doctors and This assumption is confirmed by the motion picture industry when it depicts operating rooms, hospital scenes, and the like Only doctors and nurses are portrayed Seldom if ever in their professional roles is the motion picture audience aware that in addition to the medical professional personnel (doctors and nurses) there is the vast army of the nonprofessionals the suppliers, the builders, the engineers, the electricians, elevator operators, building service employees, clerical help, technicians of all kinds, whose services are essential to the actual, if not to the pictorial production of "medical care" in its modern meaning

This nonprofessional army is not restrained by professional ideology, but is motivated by economic necessity to adopt modern methods of collective bargaining in dealing with its various employers employers are not the doctors and nurses except in rather isolated instances Nor have the doctors or the nurses for that matter any control over the working conditions, wages or other possible matters of dispute between the employers and the employed matter of fact, the scene of the disturbance² may be remote from any location directly related to the popular conception of a place where "medical care" is rendered The effect on the continuity of medical service of work stoppages by nonprofessional groups either local or remote may be profound. Also the cost of medical service will reflect rising labor costs in the ancillary or nonprofessional services, while professional fees or salaries remain at nearly the same levels

The educational program of the medical profession has been inadequate if not entirely neglectful of discussion for the information of the public, of the components of "medical care," and their relative effects on the continuity and costs of modern medical service. It is time now to analyze these carefully and to present the facts. If this is not done it is highly probable that in the public mind the rising costs of "medical care" will be laid at the door of the professional component, since the term "medical" is associated in most peoples' minds only with doctors and nurses.

The Importance of the General Practitioner

We have just read an article in the Wisconsin State Medical Journal under the title "Is Overspecialisation a Threat?"

Our answer is an unqualified "Yes"

We happen to be a Diplomate of a Speciality Board so that the remarks that follow may be accepted as coming from one looking from the inside out, and not, enviously, from the outside in

The article is so good and the questions it poses of such general interest that we should like to have it reprinted in full. Unfortunately, this is not possible because of the paper situation

But with or without the complete text we

¹ Aug 1, 1946, p 1687, Sept 1, p 1912, Sept 15, p 2024

¹ Work stoppages, slow down strike jurisdictional controversy or walk-out

¹ Dawson, C A. Wisconsin Med J 45 1045 (Nov) 1946

feel that in this article there are certain generalities that we may present for our readers' thoughtful consideration

- 1 A doctor is (should be) a person who can look upon an ailing human being and, with the advantages of a more or less standardized education, make a fairly good guess at what is the matter with him
- 2 In the history of any profession or trade there have always been outstanding individuals who attracted followers because there was no dispute whatever as to their superior ability. Such men were allowed scope for their genius because no authority could keep the public from them.

They drew to themselves disciples, and disciples drew to themselves disciples, and as generation followed generation the individual strain of the original genius petered out. When that happened the anemic survivors began to gather together for mutual protection into "schools" Thus we have today those hornd survivals of Mediaevalism—"do you belong to the London, the Edmburgh, the Dublin, the Paris, the Vienna, the Berlin, the Mayo, the New York, the California School?"

- 3 Every closed organization exists because of the instincts of the insecure to put a fence around themselves for the purpose of keeping out people of whom they are afraid. We used to think that clubs existed for the purpose of making their members happy. After some experience with such organizations, we now believe that they sometimes achieve the purpose of making those who do not belong to them unhappy. No doubt there is also an opportunity afforded for self glorification.
- 4 We believe that organizations such as the American College of Surgeons and the various Speciality Boards were founded in the sincere desire to prevent the unskilled from preying on the general public
- 5 We believe that they had not long existed before the general practitioner began to see the tremendous professional, social, and financial advantages that might accrue to him could be crash their barriers. We believe that it was not long before their barriers were, and have been since, increasingly crashed
 - 6 We do not believe that any such Board

of Examiners, however admirable and impartial, can properly judge of the qualifications of candidates proposed to them by necessarily biased proposers and seconders. Any examinations candidates may take are futile. Any examination may be passed by a well-coached man with a good memory. No examination will disclose the answer to the all important question "Has this man any sense?"

We know that Sir James Paget and Sir Astley Cooper could no more pass an examination to become a Diplomate of the American Board of Surgery than they could fly, yet how much happler should we feel in their hands than in those trained in the latest wrinkle of that branch of carpentry

Time was when the qualifications of a doctor were judged by his peers in his own community. If a man were a good surgeon he needed no more certification than the esteem of his community and his fellow practitioners.

Time was when if a man felt himself unqualified to do an operation he would say so and we think he lost the respect of no man by so doing. Time was if help was far away or not available at all and he knew that if he did not operate that the patient would due he would explain that at the best his unskilled hands could do no more than hasten the inevitable doom and very often such a man would save the patient. As the news of his skill at some particular operation, and the fame of his courage and skill spread, he might eventually find himself a specialist

But, before everything, such a man was a doctor We are profoundly depressed by what we read and hear of doctors rushing out of the Army into specialities because they think there is more money to be made that way

As the years roll by we may become more and more uncertain as to the dignities and rewards of the medical profession. We did not go into it because we wanted to make money

We acknowledge the necessity for special ists. We are one ourself and we call on others all the time.

But we insist that the crying need is for doctors. A doctor is a man who can deal with emergencies himself. A doctor is a man

who looks at another man's wife's face and explains to an Industrial Court why that particular man never got over his backache A doctor is either a married man or one who has grown up in such a household that he is just as well acquainted with the ordinary burdens of life as any of his patients are A doctor is a whole man, if any whole man still exists, who can look at his patient as a whole man and make a fair estimate of his condition

As he talks to him, examines him, "sizes him up," as we used to say, he will gradually come to the conclusion that one part of that man is much further out of whack than the rest of him. If the man's eyes, kidneys, heart, spine, or whatever it may be is obviously the presenting abnormality and so abnormal as to be beyond his skill, he will then send the patient to a

specialist with a full history of the patient Under such circumstances the chances are that the patient will get good treatment at small cost and, what is most important, will not, after making the rounds of specialist after specialist return to his home penniless and distracted, convinced that he is a collection of disassociated parts, none of which is functioning very well and which he is quite sure will never again become harmoniously associated

The general practioner is not a man who has spent his life in the cloistered pedagogy of full-time medicine, where the professors have nothing to do but hand down their wisdom to their inferiors

We are 100 per cent behind the general practioner who, second, knows what he knows, and first knows what he doesn't know

The Common Man

The "Common Man" is a popular phrase these days, much mouthed by phrase makers and their ilk What does the term mean? The hireling of any sort, the agricultural laborer, the migrant worker—to go back a short eighty-three years, the slave?

He is the man whom certain of the master minds of our present government think they can conciliate, wheedle, spoil, or bully into voting them into power year after year

Their philosophy, it seems to us—if they may be permitted to dignify their doctrine of expediency by that title—displays a complete distrust of humanity—That in order to gain "security" the "Common Man" is willing to take from the rich as much as the tax law will give him, providing he doesn't mind acknowledging that he is poor and quite willing to be the complacent recipient of bounty

In the old days, when party lines were sharply classified between the rich and the poor, Robin Hood frankly stole from the rich and gave to the poor. He undoubtedly felt himself to be the first champion of the "Common Man". But there was no nonsense about what he was doing. He and everybody else called it stealing. Though Robin Hood was a popular character we doubt very much, even in those bad old days in England, that the poor man thought of himself as the

"Common Man" The archers who won the battle of Agincourt may have been known as "villeins" but they were not common

When Hampden and Cromwell rose in the House of Commons to assert their rights they did not think of themselves or of those they represented as "Common Men" When they persuaded their constituents to such an assertion of their powers as cutting off their King's head they did not think of themselves as common

If you have any trace of faith in the doctrine of Democracy you cannot afford to think of any man as common. The slave, whom many Southerners resented as an intolerable burden, was certainly the "Common Man" But even the slaves resented the title and were not content with their security. In their dark African minds they knew that no man dependent on another is a man. And they were continually running away even from their kindest masters to prove it. Some of them, at least, wished to be responsible for their own selves and their own families.

In a democracy we can think of nothing more debasing than self-styled Representatives of the People talking down from their self-erected thrones about, and to, the "Common Man" The moment that we abandon ourselves and look to our Government to shoulder our individual responsibilities, to make us secure from cradle to grave, to provide for us and our dependents in health and in sickness, in youth and old age, we are relinquishing the only quality on which man may pride himself—his dignity

Incidentally, we blushingly enquire, upon what ment do these Representatives of the People feed, that they are grown so great? Are they not human beings like ourselves?

If you prick them do they not bleed? If there are those in these United States sufficiently deluded to believe in Government with a capital G we say to them "Si monumentum requiris, circumspice" The Wagner Act—strikes—strikes—strikes

This is not a political speech, out of place in a medical journal. It is a reminder to doctors and through them to the people, that under a democratic form of government those who rely on others and not on them selves for sustenance will not long endure

Current Editorial Comment

Fatal Aplastic Anemia Following Use of Tridione Recent medical literature contains two reports, each describing the rapid development of fatal aplastic anemia in a woman with epilepsy treated over a consid erable period of time with tridione. In each case the anemia was progressive, apparently irreversible, and not responsive to any form of treatment Tridione (3,5,5-Trimethyloxazolidine-2,4-dione, Abbott) has recently been made available for general prescription It has been found beneficial in the treatment of convulsive disorders including epilepsy, its most dramatic effects being observed in petit mal of childhood. Its toxic manifestations previously reported were few, and included relatively unimportant skin rashes, hemeralopia (visual sensitivity to bright light), nausea, drowsmess, lightheadedness, and disturbances of color vision

The fatal case of aplastic anemia reported by Francis F Harrison et al 1 had received tridione and dilantin (methylphenylethyl hydantom) each in doses of 0.1 Gm. three times daily for a period of six months. On admission to the hospital, the 16-year-old girl had pallor, palpable posterior cervical lymph glands, a few petcahial hemorrhages and ecchymotic areas in the skin, and three small necrotic areas in the mouth essential laboratory finding was the evident pancytopenia" hemoglobin 76 Gm per cent, red cells 3,100,000, and a leukocyte ∞unt of 1,000 The differential count showed polymorphonuclears 5 per cent, lymphocytes 89 per cent, monocytes 5 per cent, and eosmophils 1 per cent The platelet count was 42,000, bleeding time was over fifteen minutes, capillary clotting time ten minutes, sedimentation rate 56 mm. per

hour, hematocrit 25 per cent, and the cor-

rected rate 22 mm per hour. The patient was treated with penicillin streptomycin, pentinucleotide, crude liver extract, folic acid, and blood transfusions. A persistent menorrhagia, developing on the sixth hospital day, could be controlled only temporarily by repeated uterine packing. An infection followed, resulting in death of

the patient on the thirty-eighth hospital day
The autopsy showed the ribs to be like
dried honeycomb and devoid of marrow
The fat of the sternum and midfemur showed
only the "barest suggestion of hemopoietic
tissue" The cellularity and redness of the
marrow of the first lumbar vertebra was
about 50 per cent of normal

The fatal case of aplastic anemia reported by Mackay and Gottstein² was that of a woman 23 years old who during the previous ten months had received no drug except tridione and phenobarbital. The latter had been administered to the patient for nineteen years without apparent ill effects. The dose had varied but was usually 4 grams daily The dose of tridione during the ten month period had varied from 0.9 to 1.5 Gm, daily

On admission to the hospital, the patient compliance of headache, vomiting, general weakness, and fatigue. Her skin was pale, face puffy, there was a large retinal hemor rhage and several purpure spots in the skin. The hemoglobin was 48 Gm per cent, red cells 1,550,000, leukocytes 4,250 of which 79 per cent were lymphocytes and 15 per cent neutrophils. The platelet count was 17,050, coagulation time four minutes, and the bleeding time was indefinitely prolonged.

The treatment with tridione was discontinued In addition to the anticonvulsants

¹ Harrison, Francis F., et el.: J.A.M.A. 132, 11 (Sept. 7) 1946.

³ Maskay Roland P and Gottstein, Werner K.: J.A.M.A. 132:12 (Sept. 7) 1945.

(phenobarbital and biomides), the patient received liver extract, lextron (liver and iron capsules), ascorbic acid, folic acid, penicillin, and blood transfusions which caused increasingly severe febrile reactions. No form of treatment was beneficial, the course of the disease being rapid and overwhelming. She died on the twelfth hospital day, with a temperature of 107 4 F, pulse 148, and respiration 52

At necropsy the one general finding was hemorrhages throughout the body—subserous, submucous, and petechial—involving the organs of the digestive, respiratory, and genitourinary systems. A striking difference between the postmortem findings in these two cases is that in the 16-year-old girl, who had received smaller doses of tridione, the outstanding effect was on the bone marrow, while in the 23-year-old woman, who had received larger doses of tridione, "the bone marrow was not affected"

Mackay and Gottstein point out the interesting fact of the similarity of the chemical structural formula of tridione and aminopyrine known to have a destructive effect on leukocytes. Both tridione and aminopyrine contain a pentagonal ring with a carbonyl group at the same position in the molecule of each

In view of the facts presented in these two clinical reports on the toxicity of tridione. particularly on the hematopoietic system, it is well to restrict the sale of this popular drug to those for whom it is prescribed by a physi-And physicians should avoid giving it to patients with blood dyscrasias and to those whose convulsive disorders can be controlled by the use of drugs that are less dangerous It is hoped that further research on tridione will result in elucidating its metabolism in the body, in reliable clinical laboratory tests to indicate the approach of danger, and, perhaps, in alterations of its structural formula to reduce its toxicity and increase its therapeutic efficiency

The Rich Report At the meeting of the House of Delegates of the American Medical Association held in Chicago, in December, 1945, the Board of Trustees announced to the House of Delegates that it had employed a public relations counsel to survey the work of the American Medical Association in its relationships to the medical profession and the public The Raymond Rich Associates were employed for the purpose and

spent almost six months in an intensive study of the activities of the Association in its headquarters office and in sampling opinion from a variety of sources as to the public concept of the work of the Association in advancing the progress of medical science, in rendering medical service, and in exercising leadership in the medical field

Some misapprehension was expressed at the San Francisco session over the fact that the Board of Trustees did not at that time present to the House of Delegates the complete text of the Rich The portion which was presented to the report House of Delegates dealt with certain actions already in progress, to which the Board of Trustees had given careful consideration recommendations of the Board of Trustees were at that time accepted by the House of Delegates They included as their prime objective the establishment in the headquarters office of a division of public relations under a full-time, salaried public relations counsel, intensification of the activities of the Council on Medical Service leading toward prompt fulfillment of the desire to set up throughout the nation voluntary systems of prepayment against the costs of sickness which would cover vast numbers of people, and extension through the Journal and Hygera to the medical profession and the public of information regarding the progress of medical science and its good for the American people, with special emphasis on the celebration in 1947 of the one hundredth anniversary of the American Medical Association

Although the time has been short since the meeting in San Francisco during the first week of July, the Board of Trustees has already taken the necessary steps toward expansion of Hygeia, both in make-up and in circulation, toward expanding the radio program of the American Medical Association on a considerable scale, and toward a crowning celebration of the Centennial at the meeting in Atlantic City in June, 1947 The Council on Medical Service has intensified its efforts toward the extension of voluntary prepayment plans and has reported a rapid rise in the enrollment of people in such plans ferences have been held with representatives of nonprofit as well as of private insurance plans, and the establishment of acceptable standards is well under way The Board of Trustees in a meeting just completed has authorized the retaining of Raymond Rich Associates as a public relations counsel, as well as the employment of a full-time officer for this purpose in the headquarters office, with a budget adequate to the needs of the Association

THE OPERATION OF PORTACAVAL ANASTOMOSIS INDICATIONS, REPORT OF CASES

ARTHUR H BLAKEMORE, M.D., New York City

(From the Department of Surgery of the Presbyterian Hospital)

HE principle of establishing portacaval A shunts to effect a reduction of blood pressure in the portal system in cases of portal hypertension is a sound one The first portacaval anastomous was performed in 1877 by Von Eck, a Russian physiologist. His operation upon dogs, anastomoung the portal vein to the vens cave, side to side became widely known as the Eck fistula

Surgeons early recognized the rationale of employing the Eck fistula to alleviate portal hypertension although we could find in the literature only a few reports of its attempted use. There were, no doubt, operations performed that were never reported I, myself, in 1930 performed a side-to-side suture anastomous of the ileocolic vein to the vena cava in a case of cirrhosis of the liver The anastomosis promptly became occluded by thrombus. In 1942 Drs Allen O Whipple and Louis M. Rousselot performed a su ture anastomosis between a large branch of the superior mesenteric vein and the spermatic vein. The anastomosis became occluded.

These two failures and the poor results reported in the literature are convincing evidence that suture anastomoses for the establishment of porta caval shunts have failed too frequently to make it clinically practical.

Surgeons interested in vascular surgery are cog nisant of the fact that greater precision in intuma coaptation is required for the successful anastomosus of veins than is necessary to the success of ar terial anastomosis. It seems likely that the varied technical difficulties, madequate exposure, etc., regularly encountered in the performance of por tacaval shunts will always preclude the certainty of accurate placement of each statch so necessary for a perfect intima to intima coaptation of the vein walls. The above uncertainties, inseparable from the suture technic, prompted Dr Whipple and me to try a nonsuture technic employing vi tallium tubes in the establishment of portacaval shunts. The outstanding feature of the nonsuture method of blood vessel anastomosis is that it af fords a broad intima to intima coaptation of the vessel walls without an intervening foreign body suture. The nonsuture method had proved highly successful in your graft bridging of arterial defects

Method

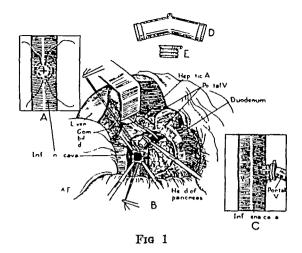

Vitallium a nonirritating alloy, is molded into tubes varying from 5 to 12 mm in diameter The type of tube adopted for use in the performance of portacaval shunts is slightly funneled at one end upon which is placed a holding tab. 2 and 4 mm, respectively, from the other end of the tube are two tving (holding) ridges.

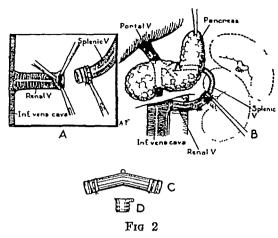

To perform the anastomosis, the portal vein is ligated and sectioned close to the liver (Fig. 1) The end of the vein is passed through the funnel end of a proper sized vitallium tube and everted (cuffed) over the other end well above the proxi mal tying ridge on the tube. The vein is then secured upon the tube by a ligature of 3 zero dek natel silk placed proximal to the tying ridge. The vens cave is next mobilized from the renal veins to the undersurface of the liver. A comfortable site on the anterior surface of the vena cava is selected for the anastomous. A purse string of zero deknatel silk is introduced and the vena cava promptly occluded above and below the purse string with rubber shod clamps. A cruciate inci sion, sufficiently large to admit the tube is made in the vena cava within the purse-string area and the tube bearing the everted portal vein is promptly inserted into the opening. Finally, the purse string is tied tightly around the tube proxi mal to the distal tying ridge, thus completing the end to-side ansatomosis.

A splenorenal portacaval shunt may be effected by removing the spleen and left kidney (Fig. 2) The stump of the splenic vein is mounted on a vitallium tube and the latter is introduced into the stump of the renal vein. These anastomoses afford intima to intima contact only and can be performed considerably quicker than suture anestomoses.

The question very properly may be asked at this point what chance has a portacaval anastomosts remaining permanently open though the anastomosis be done in an ideal mannernamely intima to intima approximation? The answer to this question is that there is a very ex cellent chance of a portacaval anastomosis re maining patent when performed in the presence of portal hypertension. It must be remembered that in cases of portal hypertension the pressure 13 3 to 5 times greater than normal The establishment of a portacaval shunt under these conditions connects a high pressure portal circuit with

Presented at the 140th Annual Meeting of the Medical Sociaty of the State of New York, Section on Surgery May 3 1946

a low pressure caval system The result is an extreme increase in the rate of blood flow through the portacaval shunt which, in turn, helps to prevent the initiation of thrombus at the site of the anastomosis. In the above respect, portacaval shunts are similar to arteriovenous fistulae although the pressure differences are of a greater magnitude in the latter. All are aware of the tendency of traumatic arteriovenous fistulas to remain permanently patent even though they be caused by blunt missiles, e.g., bullets

The importance of a high pressure differential between the portal and caval systems as it affects the sustained patency of portacaval shuntsis borne out by the following experimental observation. In dogs a side-to-side anastomosis of the portal vein to the vena cava is prone to close off after a matter of weeks. If, on the other hand, one increases the rate and volume of blood flow through the anastomosis by ligating the portal vein between the fistula and the liver, the anastomosis will remain open permanently.

Clinically, portal hypertension may be classified in accordance with the location of the obstruction in the portal system The obstruction may be intrahepatic due to portal cirrhosis or extrahepatic with a normal liver The most common site of extrahepatic portal obstruction is in the portal vein The cause of the obstruction may be cavernomatous transformation or atresia The spleme vein is a less common site of obstruc-If the coronary vein should join the splenic vein distal to the site of obstruction in the splenic vein there results, in addition to congestive splenomegaly, hypertension in the branches of the These cases of extrahepatic coronary vein portal bed block are commonly referred to as Banti's syndrome Hypertension in the coronary

system of veins with resulting esophageal varices is a common finding in Banti's disease

Venous pressure readings, taken at the operating table, are an indispensable aid in localizing the site of obstruction in the portal system in cases of Banti's disease If the liver appears normal, e g, an elevated pressure reading taken from a known branch of the superior mesenteric vein signifies obstruction in the portal vein itself The obstruction may be due to atresia or cavernomatous transformation If, on the other hand, the pressure is normal a second pressure reading must be taken, this time from a known branch of the coronary vein If the coronary vein pressure is elevated in a case having a normal pressure in the superior mesenteric vein, the proof is absolute that the coronary vein joins the splenic vein at a point distal to an obstruction in the splenic On the other hand, one does see cases of congestive splenomegaly in which pressure readings from the superior mesenteric and coronary veins are entirely normal In such cases the obstructive site is in the splenic vein but at a position distal to the junction of the coronary vein Or, as is so often the case, the coronary vein may join the portal vein and thus be unaffected by an obstruction in the splenic vein I wish to emphasize at this point that carefully taken venous pressure readings afford the only positive guide to the site of obstruction in cases of extrahepatic portal block Knowing the site of obstruction is essential to determine the correct surgical procedure in a given case

It has long been known that the removal of a congested spleen fails to effect favorably portal hypertension due to cirrhosis of the liver Observations have also been made to show that splenectomy fails in the majority of cases of con-

gestive splenomegaly due to extrahepatic portal block. And, finally, we know that splenectomy alone is indicated only in those few cases of congestive splenomegaly with obstruction in the splenic vein in which the coronary vein pressure is normal

In view of the above facts then, it is obvious that a surgical procedure which will reduce pressure in the coronary van and other portal radicals is indicated in the vast majority of cases of congestive splenomegaly i.e., some type of portacaval shunt is the rational procedure

The portal vein to venn cava and splene vein to renal vein are the logical vessels concerned in the establishment of portacaval shunts. It so happens that in cases of portal hypertension due to extrahepatic portal block the portal vein but rarely can be used to effect an anastomesis. This leaves us entirely dependent upon the splenorenal shunt of relief except in the relatively few cases having splene vein obstruction with normal coronary vein pressures in which splenectomy alone will suffice.

Herein lies the importance of correctly diagnosing the site of obstruction at the operating table and being prepared to proceed with a splenorenal anastomesis when indicated immediately

following splenectomy

It is reasonable to assume that thrombosis of the splenic vein stump frequently takes place following splenectomy and the chances of using the vein stump to effect an anastomosis at a second operation are not good

We have explored 8 of these unfortunate cases which had had previous splenectomies, and in only 4 cases the splenic vein stump was

patent.

If a surgeon is in doubt about the site of obstruction in a given case, or is unprepared to undertake a portacaval shunt operation at the time, he should, under no circumstances, jeopardize the patient's future by performing a splenectomy alone. To do so would destroy the one best vein available for the performance of a portacaval shunt.

Indications for Portacaval Anastomosis

The indications and use of the splenorenal shunt for the relief of portal hyportension due to extrahepatic portal block have been discussed in detail Removal of the spleen alone is indicated only when carefully made pressure readings on a branch of the superior mesenteric and coronary veins prove normal

Episodes of massive hemorrhage and recurring ascites are so much a part of the clinical picture of portal cirrhosis of the liver as to make anyone at first thought, to view with outstanding favor any operation which affords a prespect of reducing the portal pressure. On the other hand, the surgeon upon whom the responsibility rests of deciding that a portacaval shunt is indicated in a given case must exercise excellent judgment if calamity is to be avoided

It is the surgeon's duty to evaluate accurately the role (if any) of portal hypertension as the causal factor of hemorrhage or ascites in a given case of cirrhous under consideration for porta caval anastomosis. It is now known that epi sodes of hemorrhage and/or ascites may occur in cases of portal cirrhous with little, if any, clovation of the portal pressure.

To illustrate A short while ago it was our pleasure to admit to the hospital for study the wife of a Boston physician. Cirrhosis of the liver was first discovered in this case at the time of a hysterectomy operation for unexplained uterine bleeding. Liver chemistry studies at the time revealed a high prothrombin time and otherwise badly depressed liver function At this time there were no esophageal varices demonstrable by x ray During the ensuing months the patient's appetite and nutrition failed when suddenly in July, 1045 she suffered a massive hematemesis. During the next five months, until December are episodes of hemorrhage occurred, The hemorrhage attacks became so prolonged as to require continuous hospitalization of the patient for five months. Since the cessation of her last bleeding attack in December however the patient sannetite has improved with the intake of increasing amounts of protein. She was admitted to the Presbyterian Hospital for study and consideration of a porta caval anastomosis operation in April. Examina tion on admission revealed the patient to be in a good state of nutrition. The liver was hard and enlarged moderately The spleen was not palpable. There was no ascites present. The superficial abdominal veins were not appreciably distended but x ray studies revealed questionable small esophageal varices upon carrying out Valsalva s experiment The total blood proteins were normal including the albumin-globulm ratio The bromsulfalem test showed slight impairment of liver function and the prothrombin time was thirty seconds.

A review of this case reveals quite clearly that the initial bleeding from the uterus in this case was due to the lack of prothrombin, a result of severe liver damage. Absence of demonstrable ecophageal vareces during the ensuing attacks of hematemesis make it seem likely that the high prothrombin time continued as the primary cause though the presence of some perportal fibrosis must be conceded.

We did not perform a portacaval anastomosis on this patient during this hospital admission for the following reasons. (1) It is our opinion that the uterine bleeding and subsequent episodes of hematemens in this patient were primarily due to a deficient production of prothrombin on the part of the liver. There is evidence of progressive improvement in this liver function during the past three months (2) There has been marked improvement in the patient's appetite and nutrition on a regimen of high protein and carbohydrate intake, liver extract injections, and large doses of vitamin B-complex

We realize that this patient will, in all probability, hemorrhage again. But if her liver function in the formation of prothrombin continues to improve to normal, we will know, if she does hemorrhage, it will be solely on the basis of a progression of her portal hypertension. Under the above circumstances, the indication for a portacaval shunt operation would be clear-out.

A somewhat similar case to the above is that of a 17-year-old girl whom we sent back to Minneapolis This girl gave a three months' without operation history of anorexia and weakness On examination she was found to have a palpable, hard liver, a very large spleen, and ascites. She was jaundiced and extremely pale. There were no prominent abdominal veins or any esophageal varices demonstrable on Though she gave no history of bleeding other than menorrhagia, during three of her four weeks' stay in the hospital, the stools were guarac positive Her prothrombin time was in the high fifties and the rest of her liver function studies equally bad, including a reversal of the albumin-globulin ratio

During her four weeks' stay in the hospital she was given two transfusions. After three weeks on a high protein, carbohydrate diet, liver extract injections, and brewers' yeast her appetite began to improve and the ascites disappeared. The stool examinations became guaiac negative. At the time of discharge from the hospital her blood proteins had returned to normal and the prothrombin time had decreased remarkably.

We did not perform a portacaval shunt operation on this girl for the following reasons (1) She had a short history of onset and marked response to conservative therapy, (2) We considered her bleeding to be on the basis of a prothrombin deficiency due to liver damage rather than explain it on the basis of portal hypertension. Likewise, we considered her ascites to be associated with her low proteins, because of its prompt disappearance with improvement of the blood proteins, rather than attribute it to portal hypertension.

Comment

These two patients, both of whose lives had been threatened by hemorrhage, constituted a test in judgment concerning the employment of the portacaval operation. It would not have been a serious error in judgment to have operated upon the first case. She had evidence of portal hypertension. Her prothrombin time was only slightly elevated and her general condition was good. She would have tolerated the operation well. The second case, on the other hand, would amost certainly have died should she have been operated upon

It is well to emphasize at this point that there are many cases of portal cirrhosis of the liver which

do bleed severely, primarily because of an extreme elevation of the portal tension. The bleeding point is most frequently from esophageal vessels and the episode is often initiated following a cough, sneeze, or any type of effort that suddenly increases intrathoracic pressure. In such cases there is likely to have been a long history of cirrhosis and the prothrombin time may be but slightly, if any, elevated

The bleeding episode may be quickly fatal Others may be controlled for a time with multiple transfusions during which some evaluation of the liver status may be determined. There are occasional cases with persistent bleeding in which one feels compelled, with the aid of massive transfusions, to carry out a shunt operation as a lifesaving measure—such has been the case with three patients in our series all of whom fortunately survived.

Under what conditions should ascites be considered an indication for the establishment of a portacaval shunt? This question may also be best answered by citing the following cases

In late January, 1946, a 49-year-old man with ascites due to alcoholic cirrhosis of the liver was admitted for operative consideration had been under the care of an excellent internist and was thoroughly studied at the Lakeside Hospital of Cleveland For four months he had followed an excellent medical regimen for cirrhosis of the liver without any apparent beneficial effect upon the ascites However, upon his admission to the Presbyterian Hospital he volunteered the information that he believed his ascites was less, although the time for paracentesis was a week overdue The patient's observation proved correct, during the ensuing several weeks the ascites disappeared A four months' liver regimen had effected a turning point in his ascites just at the time a portacaval shunt operation was under serious consideration Ascites over a five months' period, because of the large amount of fluid formed, had constituted a great handicap to this man He had been unable to work and was most anxious to have a portacaval shunt operation the patient's liver was hard and nodular and the bromsulfalein excretion was below normal, we advised against operation at this time for the following (1) There had been no episodes of bleedreasons ing (2) His total blood proteins were normal with a normal albumin-globulin ratio The improvement of this patient's protein values in comparison with a previous study at the Lakeside Hospital plus the disappearance of his ascites lead us to conclude that portal hypertension was not an important factor in this case at this time

It must be kept in mind, however, that in spite of the excellent response to a dietary regimen in the above case periportal fibrosis may continue and, in time, a portal hypertension of such magnitude develop to cause a recurrence of the ascites

The following case well illustrates this point A 55-year-old.woman, having a long alcoholic history, in January, 1945, began to have anorexia and weakness,

followed in a few weeks by the appearance of ascites. She was hospitalized and a thorough liver chemistry study made. The total blood proteins were low and the albumin-globulin ratio reversed The bromsulfa lein and other liver function tests revealed scrious impairment of liver function The liver was hard and greatly enlarged X rays of the esophagus revealed no various. The patient was placed upon a Patek liver regimen and after a few weeks her appetite and strength began to improve The ascites more gradually disappeared as her blood proteins rose. Through the summer months the patient was in excellent condition and free of ascites. Although her appetite nutrition, and strength remained excel lent, in October the patient began to develop ascites A study of the blood proteins at this time revealed them to be excellent, however and the liver function tests better than before. The liver had shrunk con siderably over a six months' period From October through December the ascites became worse requir ing paracentesis of increasing frequency Evidence of increased portal pressure was observed for the first time with x ray demonstration of esophageal varices. In the early months of 1946 whereas the patient's appetite remained good she could not eat adequately at any one feeding on account of the ascites. Although it was demonstrated that this pa tient a liver could make albumin in normal amounts, the ascitic fluid contained a fair percentage of protein and the removal of large quantities at five-day intervals finally began to lower her total blood proteins and spell her doom. The recurrence of ascites in this case paralleled the development of evidences of severe portal hypertensian. Therefore, this patients one and only chance of survival rested upon the successful control of her accites.

The lesson we learn from this case is that the patient became doomed to die not through liver insufficiency but from a wasting ascites due to portal hypertension. I am told by a prominent internist, who heads one of the largest medical services in the country, that wasting ascites is the predisposing factor leading to death in the majority of cirrhotic cases.

Observations and Statistical Results

The modern medical and dietary regimen will often do wonders in reviving a damaged liver in varying degrees of decompensation. A sustained improvement in liver function may result. On the other hand, there is no reason to necessarily expect that such a regimen will affect fibrotic contraction of the liver or periportal fibrosis. These are pathologic processes of a predetermined course based on damage already done

The subject of indications for portacaval shunt in cases of portal curhosis may be summarized and clarified by classifying cases of cirrhosis in three groups as follows *Group I*, cases in which ascites or a tendency to hemorrhage is based on the inability of the damaged liver to form albumin or prothrombin in adequate amounts. Portacaval anastomosis is not indicated in this group

Group 2, cases of cirrhosis in which the liver function is adequate to furnish the required amount of protein and prothrombin but as a result of fibrotic contraction and periportal fibrosis a severe degree of portal hypertension has supervened Wasting ascites and severe hemorrhage can be controlled in this group by the portacaval shunt Group 3, cases of cirrhosis having varying degrees of depressed liver function plus evidence of considerable elevation of the portal pressure Such cases are candidates for the portacaval shunt operation, but the question is when? It is our present policy to study the individual case with exceeding care whenever possible over a sufficient period of time to become thoroughly familiar with the behavior of the liver before bringing the case to operation This is always possible in cases which are not subject to recurring hemorrhages The idea is to improve liver functions to its maximum, employing a comprehensive liver regimen energetically applied for as long a period as necessary

Portacaval anastomosis has been accomplished by us in 17 patients. In this group there were two postoperative deaths. In 6 of the 17 cases the site of portal obstruction was extrahepatic. Ten of the 11 remaining cases had portal cirrhosis of the liver. In one case a splenorenal shunt was performed on the basis of a biopsy diagnosis of thrombosis of the hepatic veins

Sufficient time has elapsed (one or more years) since operation to have some follow-up significance in 8 cases of cirrhosis. These cases are presented with pre- and postoperative protein values in Table 1

Ascites disappeared following operation in the

Those cases with elevated prothrombin times usually have returned to normal

4 cases in which it was present, namely, Gases 3, 5, 7, and 8 Operation was done as a lifesaving measure to control persistent hemorrhage in Cases 3, 4, and 6 Case 3 died of uremia due to polycystic disease and chronic nephritis some two and one-half years following operation Systemic arterial hypertension developed and toward the end there was one episode of hemorrhage causing tarry stools but no hematemesis as had occurred before In Case 4 there has been one slight episode of hemorrhage over a one and one-half year follow-up In Case 6 there have been several episodes of hemorrhage since operation. In this case a splenorenal shunt was accomplished with the aid of a segment of superficial femoral vein which, in our opinion, may have become occluded The remaining cases are doing well except for Case 5 who died one year following operation, apparently from sudden liver decompensation following The patient's a high fever of unknown cause physician kindly sent to us the portacaval anastomosis specimen which proved to be patent

A summary of the protein values before and after the formation of portacaval shunts in the 8 cases of cirrhosis is as follows. In 1 case (No 1) having esophageal varices but no ascites, there was a rise in total proteins and albumin following operation. In 2 other cases (6 and 7) there was a slight rise in total proteins and albumin following operation, whereas, in the remaining 5 cases (2, 3, 4, 5, and 8) there was a slight fall of these Cases 3, 5, and 8 had ascites before operation. The disappearance of the ascites following the establishment of portacaval shunts in these cases, in spite of the lowered proteins, emphasizes the

^{*} Numbers below rules indicate averages

role of portal hypertension as a causative factor

Table 2 records the bromsulfalein liver function tests in 7 cases of cirrhods before and after the establishment of portacaval shunts. The accuracy of the test must be discounted in the 3 cases hav ing varying degrees of laundice

The behavior of the hippuric acid liver function test, the cephalin flocculation test, and the pro-

thrombin time in the cases tested before and after operation are listed in Table 3

RADIOACTIVE IODINE ARRESTED CANCER IN HYPERTHYROID MAN

Radioactive iodine was effective in the treatment of a man with a malignant thyroid gland tumor according to three New York investigators writing in the December 7 issue of the Journal of the American Medical Association

The authors are 8 M Seidlin, M.D L. D Marl nelli, M.A., and Eleanor Oshry B.S. from the Medi cal Division and Department of Medical Physics of the Montefiore Hospital and the Physics Department

of the Memorial Hospital.

The investigators state that the patient, who in 1923 had his thyroid removed "was in apperent good health for 15 years. In 1939 he suddenly showed all the symptoms of an overactive thyroid, such as nervounces, loss of weight, and a rapid beating of the heart. In addition, we was native and depalement in the heart. In addition, severe pains developed in the lower back and radiated down the legs. Examina-tion revealed a malignant tumor which had spread from remaining thyroid tissue

Subsequently, other cancerous tumors were found in the lungs, thigh bone, second rib on the left aide small intestine and skull. In 1943 treatment with radioactive iodine was begun after x ray and drugs proved ineffective It was administered by mouth in the form of sodium lodide in water "Definite and lasting clinical improvement followed state the authors.

In 1944 and in 1945 additional treatment with radioactive iodine was given with a "resultant disappearance of pain, increase in weight and pro-gressive change in all clinical oritoria in the direction of hypothyroidism [decrease in thyroid activity] Roentgenographic [x ray] evidence pointed to an arrest if not a regression of the disease' states the Journal article

In conclusion the investigators say that "radioactive lodine seems to be an effective therapeutic agent in the control of this type of tumor '

MISSISSIPPI VALLEY MEDICAL SOCIETY 1947 ESSAY CONTEST

The Seventh Annual Essay Contest of the Mississippi Valley Medical Society will be held in 1947 The Society will offer a cash prize of \$100 a gold medal, and a certificate of award for the best unpublished essay on any subject of general medical interest (including medical economics and education) and practical value to the general practitioner of medicine. Certificates of merit may also be granted to the physicians whose essays are rated second and third best. Contestants must be members of the American Medical Association who are rendents of the United States. The winner will be invited to

present his contribution before the Twelfth Annual Meeting of the Mississippi Valley Medical Society to be held at Burlington, Iowa, October 1 to 3, 1947 All contributions shall be typewritten in English in manuscript form, submitted in five copies, not to exceed 5,000 words, and must be received not later than May 1 1947. The winning cessays in the 1946 contest appear in the January 1947 issue of the Management of the Management of the Management of the 1946 contest appear in the January 1947 issue of the Management of the Management of the Management of the Management of the 1946 contest appear in the January 1947 issue of the Management of the 1946 contest appear in the January 1947 issue of the Management of the 1946 contest appear in the January 1947 issue of the 1946 contest appear in the January 1947 issue of the 1946 contest appear in the January 1947 issue of the 1946 contest appear in the January 1947 issue of the 1946 contest appear in the January 1947 issue of the 1946 contest appear in the 1946 contest appear i

EVALUATION OF THE TRANSDIAPHRAGMATIC APPROACH FOR UPPER ABDOMINAL SURGERY

JOHN D STEWART, MD, Buffalo, New York

URING the past five years the transthoracic transdiaphragmatic approach has come into common use in the surgical treatment of certain upper abdominal lesions, although as recently as three years ago, single case reports in which the method was used were still appearing in the surgical literature The technic came into wide application in military surgery, particularly in the handling of penetrating missile wounds. and no doubt such experience will influence postwar civilian practice The advantages and disadvantages of this approach and its proper choice over celiotomy will be analyzed in this paper, as there is considerable difference of opinion on the In general terms, the choice of the transthoracic approach should depend on the nature and site of the surgical lesion to be dealt with, the anatomic type of the patient, and the experience of the surgeon

Technic

The approach is almost always on the left, so the patient is placed on his right side with knees drawn up and a pillow between them are stabilized so the transverse axis is vertical and pillows are placed under the thorax and head to take weight off the downward shoulder ninth rib is resected from chondral junction as far back as the articulating transverse process, although some surgeons prefer to make an incision in the eighth or ninth intercostal space intercostal incision is made more quickly but the exposure it gives is somewhat less satisfactory and with it meticulous closure of the parietal pleura is impossible At the anterior end of the rib bed the thin anterior costal attachments of the diaphragm are encountered and the incision After opening the parietal should be stopped pleura the wound edges are protected with gauze pads and rib spreaders are inserted It is rarely necessary to transect the necks of adjacent ribs to improve the exposure

If there are basal pleural adhesions these are freed and the lower lobe of the lung is displaced upward and mesially The phrenic nerve is then blocked over the pericardium with 2 per cent procaine solution A radial incision is made parallel with the muscle fibers of the diaphragm across the tendinous portion to the esophageal

Presented at the 140th Annual Meeting of the Medical Society of the State of New York, Section on Surgery, May 3, 1948

The diaphragmatic branches of the left pericardiophrenic vessels must be ligated and two or more traction sutures placed in each margin of the incision in the diaphragm If the lower esophagus is to be freed up, the pulmonary ligament is sectioned In case the lesion is in the stomach or cardio-esophageal junction it is helpful to transect the left triangular ligament of the liver and retract the left lobe medially spleen tends to protrude into the diaphragmatic incision and it must be held back with gauze packs and retractor In some instances, its removal to facilitate exposure of the pancreas, kidney, adrenal, or stomach is justifiable surgical problem lies entirely within the abdomen the phrenic nerve is only temporarily blocked with procaine However, in case of diaphragmatic hernia, trauma to the diaphragm, or lesions of the lower esophagus requiring anastomosis of the esophagus with stomach or jejunum, the phrenic nerve is crushed just above the diaphragm to produce paralysis of four to six weeks' duration

The closure of the incision in the diaphragm is important, for postoperative incisional dehiscence and herma have been observed It has been my custom to place a continuous catgut suture through the cut edges of the diaphragm, using care to include the peritoneum and parietal pleura, and this is followed by a row of interrupted silk stitches The closure must be made with particular care in the region of the esophageal hiatus, for here the diaphragm is less well Before closing the pleura of the chest wall, the intercostal nerves above and below the incision are blocked posteriorly with 2 per cent procaine solution A number 22 catheter with an extra eye cut in it is left in the uppermost aspect of the pleural cavity and kept on gentle suction during closure of the pleural cavity thetist increases the positive pressure to inflate the lung before the catheter is removed forceps, such as "hon-jaw forceps," are used to hold together the adjacent ribs while the rib bed is closed in two layers. The transected muscles and fascia of the chest wall are anatomically restored in layers In most instances I have not drained the pleural cavity In about half the cases small amounts of air and serosanguineous fluid are aspirated from the pleural cavity postoperatively

Ether anesthesia administered through an intratracheal catheter has been used routinely in

my cases. Others have obtained satisfactory results with ethylene or cyclopropane, and a closely fitting face mask for maintaining positive pressure.

The patient should be well atropinized, when the esophagus or mediastinum are subjected to any manipulation, to reduce the likelihood of reflex vagal cardiac block and ven tricular fibrillation

Preoperative and Postoperative Care

In elderly patients preliminary digitalization has been recommended. Where the lesion does not be preclude doing so a misognature tube should be put down before the operation. Physiologic salt solution and blood are administered during the operation through an ankle vein. At the conclusion of the operation the bronchial tree is cleared of any secretions by suction through the bronchoscope. The patient is given oxygen therapy usually by means of an oxygen tent, for twenty four hours or so postoperatively. Peni cillin is administered for a week before and a week or ten days after operation.

A major objective in postoperative care is early, complete re-expansion of the left lung. As mentioned above, aspiration of any remaining air or pleural fluid hastens the process. In some instances intercestal procaine block is performed twenty four hours after operation to favor free use of the muscles of resouration.

The patients are encouraged to get out of bed as early as their strength permits, which is usually within a week after operation. X-ray check up of the chest is made within three days after the operation and at appropriate intervals thereafter.

Indications for the Approach

The operation is used chiefly for left-sided exposure of the upper abdomen and for bringing up the stomach or jejunum above the diaphrigm following resection of the esophagus. On the right ade the hepatic mass interposes itself and prevents access to the abdominal viscers. Before selecting the approach for lesions lying below the diaphrigm the position of the patient's diaphrigm in relation to the thoracic cage should be studied by x-ray at inspiration and expiration. The diaphrigm varies in different individuals in relation to the ninth rib, and if its dome is below the level of the tenth rib in the midaxillary line at expiration, the abdominal route is probably to be preferred

1 Bengn Gastric Lenons—For high penetrating ulcers and for chronic gastritis subtotal or total gastreetomy is readily performed I have experienced no difficulty in turning in the ducdenal stump, the only modification of the usual technic being the use of a right-angle clamp

The access to the body of the pancreas, the left lobe of the liver, and the left gastric artery in high penetrating ulcers is particularly satisfactory. The operation obviously should not be used for duodenal or prepyloric lesions.

- 2 Malignant Gastric Lesions —The usefulness of this approach in gastrectomy for malignant disease occupying all or the upper aspects of the stomach and cardia is beyond question 2.1 The entire abdomen can be readily palpated for metas tases, including the reaches of the pelvio peritoneum. The great omentum, the gustrocolle ligament, and the gastrohepatic ligament and their lymph nodes are readily removed with the stomach. In cancer of the cardiac orifice, this approach is obligatory, for the lower esophagus may be involved above or below the diaphragm and esophagojunostomy in the chest may be required.
- Lessons of the Lower Half of the Thoracac Esophagus and the Subdiaphragmatic Esophagus -For cancer, stenosing benign ulcer stricture, diverticulum, cardiospasm, and other lesions of the lower esophagus the approach is essential in that it allows the stomach or rejunum. whichever is appropriate, to be anastomosed to the esophagus following resection or plastic operation 4 Furthermore, cancer of the esophagus tends to spread in its wall and a lesion arising in the supradiaphragmatic esophagus may extend below the diaphragm. The lymph nodes below the diaphragm and in the region of the left gastric artery are often involved in cancer of the lower thoracic esophagus Cardio-esophagoplasty for cardiospasm can be done satisfactorily through the transdiaphragmatic approach, but in 2 cases I recently operated upon the left subcostal abdominal incision was used, as in both instances the diaphragm was relatively low in the chest.
- 4 Splenectomy—The spleen presents in the diaphragmatic incision and is readily exposed By standing in front of the patient the operator can manipulate the splenic pedicle with ease. As previously mentioned, incidental splenectomy is sometimes of aid during gastrectomy
- 5 Left Kidney and Adrenal.—Easy access to these organs can be obtained with the approach, but I have not had personal experience in this field except to note the fact during other applications of the technic.
- 6 Tail and Body of the Pancreas—The left half of the pancreas is quite accessible through this approach, as are the spleme artery and vein coursing above the pancreas. This is of advantage in the surgery of penetrating benign gastric ulcers and in cancer of the stomach.

7 Diaphragmatic Hernia—In the repair of histal hernia, laceration of the diaphragm, and traumatic herniation, I believe the advantages lie on the side of the transthoracic approach, though this is a matter of opinion. Freeing the abdominal viscera adherent in the pleural cavity, crushing the phrenic nerve, and overlapping the diaphragm in closure seem to me technically simpler when working above the dome of the diaphragm than by laparotomy. It has been pointed out that the right-sided transthoracic approach is obligatory in the repair of herniation through the right half of the diaphragm, as the liver prevents access from below.

488

- Penetrating Thoracico-Abdominal Wounds -The value of the approach in the management of penetrating and perforating thoracicoabdominal wounds was well established during the past two or three years 7 8 In the presence of a transdiaphragmatic wound of uncertain extent the approach permits satisfactory exploration of the upper abdomen as well as The repair of wounds to upper the hemithorax abdominal viscera, closure of the diaphragmatic wound, and surgical treatment of the thoracic lesion are quickly effected, and, if necessary, perforated colon can be brought out through a short incision in the upper abdominal wall with the erratic and unpredictable body wounds of high explosive missiles the broad usefulness of this technic was found invaluable
- 9 Lesions of the Splenic Flexure and Distal Transverse Colon —This part of the colon is well exposed through the transdiaphragmatic operation. However, this approach is undesirable for intrinsic colonic lesions, in my opinion. Mobilization of the descending colon, complementary eccostomy, or exteriorization of the diseased segment may be required and the abdominal approach is therefore more generally suitable.

Contraindications

The conditions which render the approach by laparotomy preferable to transdiaphragmatic exposure of the upper abdomen may be summarized as follows

- 1 Presence of extensive abdominal adhesions from previous operations
- 2 Lesions which, though primarily situated in the left upper abdomen or epigastrium, may nevertheless necessitate surgical procedures elsewhere in the abdomen
- 3 The presence of an abnormally low diaphragm, as in an emphysematous thorax
- 4. Suppuration or chronic inflammation in either lung or pleural cavity
 - 5 Intraperitoneal infection
- 6 Extensive left pleural adesihons, as from previous empyema, operation, or trauma

- 7 Greatly reduced cardiorespiratory reserve
- 8 Upper abdominal procedures for which local anesthesia is the anesthetic method of choice

The objection has been raised against the transdiaphragmatic operation that by it two body cavities are invaded rather than one. It is agreed that pre-existing infection in either the pleural cavity or the upper peritoneal cavity creates a hazard which renders this approach unjustifiable Furthermore, the operation takes somewhat longer than does approach by langrotomy and there is the likelihood of somewhat greater loss of blood General anesthesia administered in a closed system with provision for positive pressure and endotracheal aspiration are required, which may constitute a disadvantage if anesthesia facilities and experience are limited On the other hand, patients are more comfortable than after laparotomy, and it is easier to mobilize them early after operation It is said, also, that respiratory function is less crippled and sputum is more easily raised, and that anesthesia need be less deep 7

There are two prime advantages in the method, however. One is that when properly selected a much better exposure can be obtained of the operative field in the upper abdomen than by laparotomy, and adequate exposure is always an essential in good surgery. The second advantage of chief importance lies in the fact that upper abdominal and lower thoracic exploration and operative procedures can be combined in the same field.

Several brief illustrative case reports follow

Case Reports

Case 1—A H, a 60-year-old woman was admitted to the hospital, giving a history of epigastric pain, nausea and vomiting, constipation, and weight loss. Three years previously, there was a period of epigastric pain radiating down both arms. Her gall-bladder had been removed eight years previously X-ray studies showed the stomach and duodenum to be normal. An esophageal diverticulum 1 cm in diameter was found 3 cm above the diaphragm and pressure in the area was painful. There was also a small hiatus hernia.

At transpleural transdiaphragmatic operation the upper abdomen was explored, the esophageal diverticulum was freed up and unfolded, and the hiatal hernia was repaired. The phrenic nerve was crushed, the pleural cavity was not drained. Post-operatively, the left pleural cavity had to be tapped several times to remove sterile serosanguineous fluid.

Case 2 —W B, a 70-year-old man, came into the hospital, complaining of epigastric distress, vomiting, weakness, constipation, and loss of 20 pounds in weight during a period of four months. An epigastric mass was palpable, and the x-ray study showed diffuse infiltration of the stomach by tumor. Free hydrochloric acid was absent from the gastric juice, and occult blood was present in the stools, the red

cell count was 3,900 000 per cmm., the serum protein concentration was 3.9 Gm. per 100 ec

Transdiaphragmatic transpleural operation was performed through the bed of the ninth rib stomach was involved almost completely in a scir rhous cancer the liver, peritoneum and regional nodes appeared free from spread. Total gastreetomy with removal of the great omentum gastrocolic ligament, and gastrohenatic ligament was performed and anterocolic ecophagojejunostomy with enteroenterostomy followed. The phrenic nerve was not crushed, the pleural cavity was not drained. Convalescence was uneventful, the pleural cavity did not require tapping. The pathologist found one lymph node to show cancer and the growth in the stomach was of the linitis plastica type.

Case 3 -W K a 26-year-old man, was admitted to the hospital with a story of intractable mid epigastric pain of several months duration. There was gastric hyperacidity, and x-ray studies disclosed a deep penetrating ulcer high on the posterior wall of the stomach near the cardia.

At operation by the transdiaphragmatic route, a penetrating pleer was found 6 cm below the gastroexophageal junction it had perforated the stomach wall proper to involve the splenic artery and vein, the pedicle of the spleen and the tail of the pancreas. About four fifths of the stomach was removed including the ulcer, and anterocolic Hoffmeister gastrojejunostomy was performed The duodenal stump was closed by three rows of stitches the phrenic nerve was crushed Convalescence was without incident. The pleural cavity was not drained or tapped postoperatively

Case 4.--Y L., a 22-year-old man was admitted to the hospital within an hour after attempting to commit suicide by shooting himself in the left hypochondrium with a 45-caliber pistol. The bullet entered just below the rib margin and came out in the left midaxillary line, at which point the ninth rib was shattered.

At operation the ninth rib was excised completely from chondral junction to transverse process, the lower lobe of the lung was retracted, the disphragm was incised, and the upper abdomen was explored A perforation in the spicule flexure of the colon was closed the spleen which had been fragmented was removed and the blood in the peritoneal cavity was aspirated. The wound and the incision in the diaphragm were closed the phrenic nerve was not crushed the pleural cavity was closed without drainage. Convalescence was complicated by malaria and by a small basal empyema on the left which was treated by rib resection.

Cass 5 -W W., a 50-year-old man gave a twoyear history of upper abdominal distress loss of 15 pounds in weight, occasional vomiting, and recent hematemeels. There was no free hydrochloric acid in the gastric juice and x ray studies suggested deformity of the greater curvature of the stomach near the cardia, with a tenative diagnosis of carcinoma.

Using the transdianhragmatic approach, the upper

abdomen was carefully examined. There was diffuse soft thickening of the gastric wall, but though the omental bursa and the stomach were opened to complete the examination, no evidence of tumor was present. Instead there was obvious hypertrophic enstritis involving most of the stomach. Biopey was taken. The phrenic nerve was not crushed the pleural cavity was not drained Convalescence was uneventful.

Case 6 -A L., a 50-year-old woman, presented a two-year history of recurring bouts of pain in the left hemitherax coughing, dyspnes, and dysphagia. On several occasions straw-colored fluid had been withdrawn from the left hemithorax, and a diagnosis of "lung cyst" had been made in another hospital X-ray studies showed a large structure filled with gas and fluid, thought to be presenting above the dome of the diaphragm on the left, and barium outlined a distorted gastric fundus.

At transthoracic approach through the bed of the ninth rib the upper half of the stomach and the splenic flexure of the colon were found trapped above the diaphragm in the posterior mediastinum. The neck of the sac was densely adherent and definitely constricted the contained organs. The hernia was reduced, and the defect including the histus was repaired by overlapping the edges. The phrenic nerve was crushed above the diaphragm. Convalescence was uneventful, except for pain in the chest wall incision which was relieved by intercostal nerve block.

Case 7 -P T., a 63-year-old man, came into the hospital with a bleeding penetrating gastric ulcer high on the lesser curvature and posterior wall of the stomach. The red cell count was 2.800,000 and the serum protein concentration 8 9 Gm. per 100 cc. Bleeding continued under observation in the hospital and accordingly transthoracic transdiaphragmatic total gastrectomy was performed had eroded the pancreas. An anterocolic jejunoesophagostomy with jejunojejunostomy was done The phrenic nerve was not crushed, the pleural cavity was not drained. Recovery was rapid and without incident.

Summary

The technic, indications and contraindications advantages and disadvantages of the transilioracic transdiaphragmatic approach for upper abdominal surgery are discussed Illustrative cases are reported.

THE PREVENTION OF COMPLICATIONS FOLLOWING SURGERY ON THE URINARY TRACT

GEORGE E SLOTKIN, MD, Buffalo, New York

(From the Department of Urology, Millard Fillmore Hospital)

HE mortality rate in urologic surgery has Lundergone progressive and remarkable improvement in the past years devoted exclusively to this type of surgery, so that relatively, in comparison with general surgery, considering the type of patient, the degenerative processes in the urmary tract, and the average age, the statistical results are most commendable This study was undertaken, not to provide an additional series of low mortality rates, but, rather, to obtain a crosssection of the type of complications that arose. with or without fatal termination, and their pre-It is our belief that many of the distressing complications following urologic surgery can be avoided, the comfort of the patient materially enhanced, his general welfare improved, his hospitalization markedly diminished, and, in the final analysis, the death rate additionally improved below its present commendable average

Surprisingly, there has been a paucity of information with reference to the subject, and since our interest was aroused a few years ago and meticulous attention given to the preparation of the urologic patient for surgery, his follow-up scrutinized and covered for complications, our statistical results have been most satisfactory, the patient responding with a very smooth, uncomplicated convalescence

The complications we have found most common in the candidate for this type of surgery are almost textbook in appearance. They can be listed as infection, evidence of renal insufficiency, diabetes, gastrointestinal, cardiac, pulmonary, blood dyscrasia, thrombosis or embolism, hemorrhage, and postoperative shock

MacKenzie and Seng, in a review of 1,100 urologic cases with 265 deaths, found upon autopsy that the respiratory system showed a larger percentage of involvement than any other system. The incidence of these complications was a total of 17 60 per cent, and cardiovascular lesions form 10 per cent of the total

Hyman and Mencher,² in a study of 168 deaths, state that the analysis discloses that infection, uremia, pneumonia, peritonitis, shock, cardiovascular disease, pulmonary embolism, sepsis, hemorrhage, and cerebral accident were the

Presented at the 140th Annual Meeting of the Medical Society of the State of New York, Section on Urology, May 2, 1946

common causes of death, that they were either primary or contributory factors in death, and in their conclusions they disclose that of the 168 cases the causes of death were renal infection, 45, sepsis, 23, wound infection, 12, pneumonia, 11, peritonitis, 11, shock, 11, cardiovascular, 10, pulmonary embolism, 9, hemorrhage, 7, and cerebral accident, 3. Their study also emphasized that complications may arise which are unavoidable, despite careful preoperative care, the chief factors of which are pneumonia, cardiovascular disease, cerebral accident, and pulmonary embolism.

In December, 1944, we published a preliminary report on the use of ascorbic acid in the prevention of pulmonary complications following prostatic surgery ³ In the series reported, the preparation was used only after the complications had developed. Since that date, we have used this product prophylactically with most spectacular results, so that the incidence of pulmonary complications since November, 1944, has been entirely eradicated. I will elaborate upon this series in more detail somewhat later.

However, it is also of great importance, because of the findings of the authors above-mentioned, that many other grave and significant complications may arise Therefore, we have made very careful and thorough studies of every patient presenting himself for surgery, and we have found, much to our amazement, innumerable complications which can be listed as causes of death already present before surgery Therefore. the preparation which we have instituted as routine consists of complete blood studies, first, to discount the possibility of severe dyscrasias and anemias which cannot be determined by the florid complexion of an alcoholic prostatic, careful clotting and bleeding time, a prothrombin time, differential white counts and blood smears to discount the possibility of plasmodian disease, and infection reaction time of the patient, thorough blood chemical studies to determine the renal threshholds, diabetes, blood ureas, nonprotein nitrogens and carbon dioxide combining power, blood chlorides, and acid and alkaline phosphatase, careful measurement of the intake and output of fluids, and in selected cases where renal deficiency is suspected, either Mosenthal or Volhard tests Because a large percentage of the cases seeking surgical relief are males in the

declining years of their life and entitled to the possession of cardiovascular disease because of their age, careful delineation of this system by electrocardiography and a cardiologist will save many a sleepless might and has been material in supporting this system with freedom from complication and cardiovascular death

Many of the patients seen especially in the latter years of life, have a disturbed water equilibrium. As a result of this process many are dehydrated, or, as a result of renal impairment, the acid ammonia ratio is disturbed with the creation of acidosis and, conversely, a marked loss of carbon dioxide through fevers improper lagestion of foods vomiting and loss of chlorades creates a tendency to alkalosis. All these studies are important to prepare the patient for his surgery and to tide him over the postoperative days. We have found the tables of Chapman's most beneficial. A patient disclosing an alkalosis or an acidosis as enumerated above can be determined most readily from Table 1

The maintenance of necessary proper camesis is assured by the use of sodium chloride and other electrolytes in a form of calcium magnesium and potassium. The imbalance which occurs in disease altera the concentration of fluids either toward the acid or alkaline side. The reaction of the body fluid is close to pH 7.4 and this must be maintained carefully for proper metabolic processes.

Careful urnalysis, blood studies, and a deter mination of acidosis or alkalosis according to the table of Chapman above enumerated will prepare the patient for eventual surgery and carry him through his critical period. As stated above, many of these patients are either on the alkaline or acid side. If there has been a marked disturbance in the protein output, this can be main tained by the use of amino acids intravenously At the present time our favorite is a solution of amigen. Where severe alkalous is present, the use of ordinary saline solution either in combination of isotonic glucose, 5 per cent with saline 0.85 per cent, is frequently sufficient. However,

if the condition present is of the more severe type, concentrations up to 5 per cent may be given intravenously, and, as seen according to Table 1, calcium chloride or calcium gluconate i v is of immediate importance

In acidosis the replacement of sufficient fluid to overcome the additional dehydration may be all that is necessary, but there may be added according to the seventy of the condition, Ringer s solution, sodium lactate with Ringer's solution 1/4 Molar sodium lactate solution, or in extreme cases, 5 per cent sodium bicarbonate. It has been our plan, when an additional deficiency of renal output is noted, to increase the concentration of the glucose from 5 per cent to 10 per cent, and it has been noted that by increasing the same to 10 per cent, increased diurems is established Amino acids have been mentioned intravenously where there has been basic protein loss. These can be combined with glucose or isotonic saline The amount of amino acid administered depends upon the illness of the patient and the febrile Patients with prolonged febrile reaccondition tions vomiting or blood loss can be carried safely through this period by their use

The use of intravenous fluids is to be recommended most emphatically over the ingested or subcutaneous methods. It can be regulated, the exact volume controlled, the only serious barrier to their use being a cardiac condition of the patient. If there is no serious failure, it has been our plan in many of these cases to administer small doses of digitalis with most beneficial results until such time as the cardiography or the cardiologist has offered something more ad vantageous to this routine. The use of intra venous fluids before and after operation has been our sheet anchor, and is I believe, the one outstanding factor to smooth convalescence and prevention of complications. But indiscriminate use of intravenous fluids is condemned until such time as careful blood chemistries and studies have delineated the type of solution necessary, and then following Table 1, administered in sufficient quantities to overcome toxemia.

Infections of the urinary tract complicating surgery are today, I believe, a less formidable factor. With the proper administration and supervision of the sulfa drugs, the antibiotics which are now readily accessible in any form, especially penicillin, and undoubtedly streptomycin, now obtainable with some restrictions, have been a great factor in the reduction of this complication, especially if an obstructive lesion has been eliminated

Preoperative and postoperative hemorrhage is also being controlled by careful blood studies, above enumerated, and by the use of thrombin as recommended by O'Connor following prostatic resection or fibrinfoam. The development of a serious embolism is still a matter of grave concern, but if all the precautions of careful clotting and bleeding time, and prothrombin rates are accurately determined, even this serious factor is becoming inconsequential, and, more lately, we have had the addition of dicumerol as another factor in the prophylaxis of this condition.

I have deleted the question of pulmonary complications in these patients for a more elaborate discussion, as this study we have undertaken for the past six years has been of especial interest and has been so satisfactory that in all the surgical cases we have seen there has not been a single death from this complication In December, 1944, when the original article appeared, we were using only ascorbic acid in 25 mg doses, four times daily, after the complication had de-The entire study was actuated by the veloped development in patients previous to that date with clinical signs of moisture in the lungs, patches of consolidation, rise in temperature and respiratory rate, and with pulmonary deaths In none of the cases autopsied was there any evidence of frank pneumonia, but, rather, a socalled wet chest or bronchopneumonia Ascorbic

acid was then instituted, and, much to our gratification, the 40 some odd patients who, previous to December, 1944, had stimulated this study and received the same, entirely cleared up within forty-eight hours in a most spectacular fashion Since that date, we have used this preparation as a prophylaxis preoperatively and postoperatively, and in a series of some 170 cases we have not had a single postoperative pneumonic complication or death This procedure, therefore, is recommended most highly, especially in the aged, debilitated, prostatic patient, or the patient with chronic urinary infection who spends a great deal of time in bed. It is interesting to note that at the present time, as originally determined, the blood levels of this preparation are of no value or consequence, that this additional regimen was apparently necessary to tide them over this serious complication

A statistical study of 549 cases in thirty months has shown that careful preoperative and post-operative treatment has paid us the following dividends. However, when occasionally through carelessness, or when another service did not follow the advocated regimen, results varied quite markedly.

It is needless, I believe, to add that in the preparation of patients for surgery the use of plasma and whole blood is still one of our main sources of safety, and the use of either, depending upon the preoperative findings, is a source of great satisfaction

To illustrate the factors which have been enumerated in the preparation of the patient to mitigate a smooth convalescence and reduce still further the already existent low mortality, a survey was made of the operative cases in the urologic service at our hospital for a period of some thirty months, and it was of great interest to note that where inadequate preparation was the rule, postoperative complications and one or two unnecessary fatalities resulted. All patients reviewed were not treated similarly, and that, I believe, is the crux of this entire presentation. During this period, there were

Summary and Conclusions

Considering the type of patient who presents himself for urologic surgery, namely, that 60 per cent are in the declining late years of life with concomitant degenerative processes in other organs of the body, the death rate compared to elective general surgical cases is extremely low and probably cannot be improved through the present highly technical skill of our surgical technic developed in this type of operation.

Therefore, any further improvement in the statistics must occur in the prevention of complications following such surgery and the possibility of eradicating all those lesions except the true surgical accident or unfortunate fatality that invariably arises Certainly, pulmonary lessons can, by our studies, be entirely eliminated and would account for about 11 per cent of the deaths Ascorbic acid used before and after operation is definite proof of this contention. The curdiovascular accidents, constituting about 10 per cent, can be anticipated by the cardiologist, and with the present control of infectious complications by our newer therapeutics, additional favorable results should be expected

In the final analysis, therefore, a marked fur ther reduction can and should be expected in the prevention of complications arising the discomfort, and the final death rate in surgery on the urmary tract.

THE LOUIS LIVINGSTON SEAMAN FUND

The New York Academy of Medicine announces the availability of the Louis Livingston Seaman Fund for the furtherance of research in bacteriology and sanitary science Two thousand five hundred dollars is available for assignment in 1047 Fund has been made possible by the terms of the will of the late Dr Louis Livingston Seaman and 18 ad ministered by a Committee of the Academy under the following conditions and regulations

The Committee will receive applications either

from institutions or individuals up to March 1, 1947 Communications should be addressed to Dr Wilson G Smille Chairman of the Lons Livingston Seaman Fund, 1300 York Avenue, New York 21 N Y

2 The Fund will be expended only in grants-in-

aid for investigation or scholarships for research in bacteriology or sanitary science The expenditures bacteriology or sanitary science. The expenditures may be made for (a) securing of technical help, (b) aid in publishing original work (c) purchase of necessary books or apparatus

A CONSIDERATION OF THE EFFECT OF ANDROGEN CONTROL TREATMENT OF CARCINOMA OF THE PROSTATE

CHARLES C HERGER, M.D., and HANS R SAUER, M.D., Buffalo, New York

(From the Urological Department of the Roswell Park Memorial Institute)

RIOR to the introduction of androgen control therapy for cancer of the prostate, the only treatment of inoperable cancer of the prostate was to offer relief of urmary obstruction and the control of pain by narcotics Radiation was of dubious and, too often, of little help Relief of obstruction was accomplished by various surgical means ranging from suprapubic cystostomy, partial suprapubic or perineal prostatectomy, or transurethral resection procedures accomplished just that and nothing The introduction of castration or estrogen administration gave rise to the hope that carcinoma of the prostate could be combatted more successfully in the future However, with further experience, in a large number of patients and with prolonged observation by various investigators, it has become apparent that this method of treatment does not fulfill completely the hopes that initial or early experience suggested

Increased experience has shown that androgen control treatment does not, in all cases, prove Recurrent symptoms developing in many other cases which initially responded favorably make it obvious that androgen control treatment, as applied in its present form, does not invariably influence nor indefinitely retard the course of the disease It will be necessary to make further investigations for the purpose of determining whether our present results can be improved, and if so, how

Nevertheless, in spite of these considerations, it is the consensus that androgen control treatment is by far the most often effective and most valuable procedure now at our disposal for the treatment of patients with inoperable and rapidly progressing cancer of the prostate In these patients the method is now indispensable as a means to relieve pain, to prolong life, and to restore many to temporary usefulness

Androgen control treatment has been employed at the Urological Department of the Roswell Park Memorial Institute since September, 1941 In addition, when present, obstructive symptoms were treated by the usual surgical methods as were indicated in each individual case

About two years ago, we presented a study of

a series of 130 patients with prostatic cancer who

Presented, by invitation, at the 140th Annual Meeting of the Medical Society of the State of New York, Section on Urology, in a Symposium on Cancer of the Prostate, May 1,

received androgen control treatment and were followed for up to two and one-half years believe that a subsequent follow-up study of the same closed group of patients will offer more information as to the proper evaluation and the present status of androgen control treatment than a study which would include material of more recent date Thus, the following presentation is based on a series of 130 patients whose treatment dated back to from two and one-half to four and one-half years

It is now generally accepted that the immediate results of androgen control treatment, when effective, are regression and softening of the prostatic tumor, disappearance of pain from metastases, weight gain, as well as increased wellbeing, and resultant prolongation of life has been our experience that these results follow castration and estrogen administration in a little more than one half of the patients At the present time, it is not so much the question as to whether or not patients with prostatic cancer whom we have treated will derive any immediate benefit from androgen control treatment increasing experience, we have become interested in questions dealing with certain details of treatment and the possibility of improving or prolong-To enumerate only a few ing efficacious results

- How long will the beneficial effect of treatment persist?
- In what type of case will orchidectomy be more effective than estrogen administration?
- Should both orchidectomy and stilbestrol be used simultaneously or should one follow the other?
- Will castration yield results in patients who show unsatisfactory response to stilbestrol, and vice versa?
- Will androgen control therapy in comparatively early cancer of the prostate prevent occurrence of metastases?
- Should hormone therapy be started immediately or should it be delayed until symptoms develop which indicate locally advancing or metastatic disease?
- Finally, are additional supplementary methods of treatment available which may prolong the beneficial effect of androgen control treatment or bring increased relief to patients with resurgent symptoms, etc?

We believe that sufficient time has clapsed by now to present fairly accurate answers to all but the last question. A worthy opinion on the last question will be available only after further in vestigations which, as we understand are under way in many of the leading institutions of this country.

In carrying out androgen control treatment in the group of patients to be reported, we followed the plan in general to employ orchidectomy singly or in combination with estrogen administration in patients with demonstrable or suspected metas tases or in patients with rapidly progressing icsions. In contrast, exclusive stilbestrol medication was favored in patients with apparently very slow-growing malignant tumors in whom little or only slow progression of the lesson took place. This latter group was comprised to a large extent, of patients who had been under observation for months and years prior to the introduction of androgen control therapy without revealing symptomatic or objective evidence of progressing disease. If stalbestrol medication proved ineffective, then orchidectomy was per formed

In determining the daily dosage of stilbestrol we have mainly used doses not to exceed 1 to 3 mg. It is our opinion that daily doses of 1 to 3 mg of stilbestrol will be effective in susceptible cases, masmuch as secondary breast changes such as enlargement of breast tissue increase in size and increased pigmentation of the nipples developed in most of the patients treated. These changes occurred after an average of 50 mg had been administered in the group of castrated patients, while in the group of noncastrated patients, an average of 70 mg was required to produce similar changes.

We are aware that Moore, Wattenberg and Rosel have pointed out that the degree of second are breast changes gives no indication as to the amount of benefit to the prostatic cancer, how ever it is our opinion that the occurrence of secondary breast changes can be taken as astifactory evidence that sufficient amounts of still bestrol were administered to exert its influence on the hormonal balance.

It has been our experience that large doses of stillestrol were poorly folerated by many patients. Anorexia, nausea general malaise, and excessively painful enlargement of the breasts developed as a result of prolonged use of dosage in excess of these amounts. Regression of such symptoms occurred after the dosage of stillestrol had been reduced to 1 or 3 mg daily. When response to therapy was satisfactory, maintenance dose ranged from 1 mg daily to 1 mg, three times weekly

In determining the success or failure of treatment we were guided only by the entire clinical picture and not necessarily by the effect of treatment on one or more signs and symptoms, such as improvement of the primary lesion, weight gain, decrease in obstructive symptoms, or decline in serum acid phosphatase activity, and the like. This is important because it has become apparent during the course of prolonged observa tion that resurgent symptoms and deteriori zation of the patient's condition do not always coincide with deteriorization of any of the single signs and symptoms aforementioned other hand, we are of the opinion that a patient should be regarded improved also if pain from bony metastases regresses or disappears in spite of roentgenologic evidence of progression of metas-

Our material, consisting of 130 patients, was composed of 76 patients who presented no evidence of metastases at the start of treatment, and 54 in whom metastases were demonstrable from the beginning. Of the latter 40 had metastases to the bones 4 to lymph nodes, and 1 to the lungs

TABLE I -CLINICAL IMPROVEMENT FOLLOWING HORMONE THEBAPY IN 130 CASES

No effect without hange in 6 months plus	2	38	40
Total	54	76	130

In Table 1 above, we have summarized the results obtained as to the effect of treatment on the patient's general condition. The figures show that the end results accomplished are becoming worse with increasing length of observation. Seventy patients responded with varying degrees of improvement 20 cases were complete failures, and in the remaining 40 patients there were no indications which would suggest any change in the patient's condition for the duration of at least swing that the patient's condition for the duration of at least same that the patient's condition is not the causes.

Of the 70 patients who benefitted from treatment improvement was obtained more frequently in the group of patients with metastatic lesions. Seventy and four tenths per cent of the 54 metastatic cases showed improvement, while improvement developed in only 42.1 per cent of the 76 nonmetastatic cases. Improvement was of tem porary duration in 53 patients and has persisted to the time of writing in but 17 cases.

Total	100	100	100

In the 20 patients whom we recorded as complete failures, neither castration nor estrogen administration, nor both, had any effect in staying the progressive course of the disease. Most of these cases were either patients with locally far advanced disease or patients with widespread and extensive metastatic lesions.

Of the 40 patients who revealed no perceptible changes following more or less prolonged androgen control therapy, 38 belonged to the non-metastatic group and only 2 were patients with metastatic lesions. The latter 2 patients had paralysis of the lower extremities due to metastatic involvement of the spinal column. Both lived for more than one year without apparent benefit from treatment and without showing evidence of rapid deterioration.

In Table 2 we are presenting the end results obtained in our series of 130 patients divided into intervals of from one-half to one year, one to two and one-half years and two and one-half to four and one-half years It is of interest that the number of patients who died of the disease multiplied at each of the three time intervals by about 100 per cent (12 2 per cent-25 4 per cent-51 5 On the other hand, the number of per cent) improved patients declined particularly after two and one-half years had elapsed (317 per cent-28 4 per cent-13 1 per cent) A precipitous drop was apparent also during the two and one-half to four and one-half year period in the group of patients who were alive in deteriorating

condition (18 3 per cent—26 2 per cent—4 6 per cent)

For the purpose of more detailed and comparative study, Tables 3, 4, and 5 are presented in addition. In the latter two tables, the end results have been listed separately for every six months' interval for the group of 76 patients who had no demonstrable metastases prior to androgen control treatment and the group of 54 patients who had metastases at the time when treatment was started

Clinical improvement, when it occurs, is most spectacular in the group of patients with metastatic disease, who are suffering acutely from the On the other hand, it is often quite difficult to determine the effect of androgen control treatment in the group of patients with nonmetastatic disease Experience before introduction of androgen control therapy showed that many patients of this latter group may live with little or no discomfort for many years without any treatment In this latter type of lesion it is almost impossible to appraise the effect of hormone therapy because it cannot be determined whether or not a state of apparent mactivity or nonprogression of the primary lesion is maintained or can be prolonged as the result of such therapy

This is especially so in the group of patients with metastatic disease In a study of 1,000 patients with carcinoma of the prostate treated at the Mayo Clinic prior to the introduction of hormone therapy. Bumpus² found that 66 6 per cent of the patients who had metastases when first examined were dead within nine months results have been substantially improved by the use of androgen control therapy Of 54 patients in our series who belonged to this category, 40 were dead at the time of writing Only 9 of them (167 per cent) died within the first nine months and the average time elapsed until death was eighteen and two-tenths months in the entire Of 10 patients who are still alive, the average period of survival was forty-two and eight-tenths months, 4 patients died of other causes

It is in the group of 38 quiescent cases where castration and estrogen administration have net one of their tests. If androgen control therapy would actually "control" cancer of the prostate one would expect that at least the nonmetastatic cases will remain quiescent. Our observations were, however, that this is not the case. Sixteen of the 38 patients of this group (who were originally nonmetastatic) developed metastatic bone lessons after varying lengths of time, although they received continuous and as we believe adequate stilbestrol medication for months or several years.

Bumpus¹ places the average survival period for the group of patients with nonmetastate and more or less asymptomatic disease before or without androgen control treatment at thirty-one months after the diagnosis was established. The average time until death in 27 of our patients who belonged to thus group was thirty and eightenths months. Nesbit and Cummings¹ reported an average of thirty-one and three-tenths months two years ago. The striking similarity of these results seems to indicate that the effectiveness of prophylactic androgen control treatment is of questionable value in this group of cases.

These observations raise the important question of whether castration or stilbestrol therapy will prevent possible progression of the disease in patients with nonmetastatic and apparently quiescent disease who may live comfortably or unaware of the disease for years before symptoms of advancing disease manifest themselves ports in the literature (Neebit, 1 Nesbit and Cummings Stirling Emmett and Greene, etc) as well as our own observations, seem to indicate that the course of the disease is not substantially altered by "prophylactic" androgen control treatment. Although improvement of the primary lesion is common following employment of androgen control therapy, it must be kept in mind that sudden progression of the disease often does occur in spite of prophylactic therapy Nesbit and

Cummings' reported the incidence of metastases developing after castration to be 31 per cent in a group of 75 cases In the series of Emmett and Greene, the incidence was more than twice as much-67 3 per cent in over 200 cases own senes of 76 patients falling into this category, we observed 19 natients (25 per cent) who became metastatic, although they were nonmetastatic at the start of treatment. Eight of these 10 patients had orchidectomy done and the other 11 patients received stilbestrol administration Seven of the patients developed metastases by the end of the first year of treatment, 6 between the first and second year, 5 between the second and third year, and I patient after almost four vents

It is obvious that no statement can be made as to whether or not hormone therapy had caused any significant delay in the occurrence of metastases in these 19 cases However, we were im pressed by the rapidity of the downhill course which took place after spread of the disease had become manifest. Sixteen of the 19 patients were dead within an average of nine months. Two other patients are alive in the terminal states (two and three months) and only 1 patient, who developed metastases in the tibia in spite of stil bestrol medication for almost one year, responded favorably to subsequent orchidectomy He has remained alive in improved condition without evidence of progressing disease for another thirtyeight months. The diagnosis of a metastatic bone lesson was confirmed in this case by elevation of the serum acid phosphatase prior to orchidectomy and biopsy from the tibia

It can be concluded, therefore, that neither castration nor stillbestrol medication constitute an effective preventative measure against future development of metastases or local extension of the disease. Thus, the question presents itself whether its use as a prophylactic measure should be advocated at all in apparently quiescent non metastatic, or asymptomatic cases Considering

the fact that hormone therapy yields the most effective results in previously untreated cases, we agree with Stirling⁵ and Higgins,⁷ as well as Nesbit and Cummings,3 that this method of treatment should be delayed until its use will be required by the onset of symptoms arising from advancing or metastatic disease We regard it well within the realm of possibility that life may best be prolonged following such a procedure, so we do not favor carrying out orchidectomy as a routine procedure in apparently quiescent cases of prostatic cancer We believe that this procedure should be reserved until such time when its employment will produce the greatest amount of benefit

This line of thought is in agreement with Bugbee, 16 who, as quoted by Higgins, 7 stated as follows "If orchidectomy is carried out early in the disease, the relief it affords at a later period when it is most needed is denied the patient" Higgins, in a recent publication, 7 has expressed similar views

Nevertheless, it is the consensus that androgen control treatment should be employed without hesitation in patients with metastatic disease and in patients in whom evidence of advancing dis-More recent reports in the ease is apparent literature indicate that even in this group of patients a certain degree of conservatism has developed after the initial enthusiasm for performing castration has passed its crest immediate relief from intolerable pain is desired, estrogen therapy seems to be given preference with the idea in mind to save castration treatment as a last resort after estrogen administration has lost its effect. The effectiveness of stilbestrol as a method to relieve pain is well established, although its action is less spectacular because more time is required before appreciable relief from pain is obtained Higgins' stated that disappearance or marked improvement of pain occurs as a rule in seven to ten days if estrogen is given exclusively, while a similar degree of relief

was obtained following castration after twelve to thirty-six hours

In a group of patients who were not included in this report because they were treated more recently, we have made analogous observation. With increased experience we have become progressively hesitant in the employment of orchidectomy and we advocate its employment predominantly in patients in whom immediate relief from pain seems desirable, or in patients who do not respond satisfactorily to estrogen administration, or in patients who develop resurgent symptoms after temporary relief from stilbestrol medication

We do not see any advantage in simultaneous employment of castration and estrogen administration. The results obtained by such a combination treatment were rather worse than better. Study of our patients with metastatic disease revealed that the average time that elapsed after initial improvement until resurgent symptoms developed was eight and nine-tenths months in the group of cases who were treated with castration plus estrogen, ten and two-tenths months, if they were treated with estrogen exclusively, and thirteen and two-tenths months if they had orchidectomy only

These figures gain added significance if they are compared with figures obtained for the average survival time after the patient has developed into a delayed failure The average time elapsed until death was eight and three-tenths months in the group of patients who had been treated with orchidectomy plus stilbestrol was seven months in patients who received supplementary stilbestrol therapy after they developed into failures after orchidectomy the other hand, in the group of patients who did not continue to respond to prolonged estrogen administration, renewed relief from pain was obtained in most of the cases and life was prolonged for an average of eighteen and threetenths months by subsequent orchidectomy

These observations give evidence that still bestrol medication given in cases of failures following castration is more or less ineffective while failures which occur following axclusive stillbestrol therapy may be substantially benefitted by orchidestomy

The considerations aforementioned indicate clearly that in spite of androgen control therapy the ultimate outcome in each case is still being determined by the character of the primary lesion Hormone therapy, especially if carefully planned, may have a remarkable delaying effect on the progress of the disease if it is employed at a time when activity of the lesion manifests itself However, it must be kept in mind that the greatest degree of benefit is being limited to certain signs and symptoms of the disease while the course of the disease continues to progress. For example, disappearance of pain from metastases may be accomplished by hormone therapy yet senal x ray films reveal usually not only evi dence of continued progression of already existent metastatic lesions, but also development of new metastases in parts of the skeleton which were previously not involved Or, regression in size as well as softening in the consistency of the prostate, may occur to such a degree that rectal examination would not suggest the presence of carcinoma and yet the disease in general may continue to advance in spite of the patient's weight gain, well being, and freeness from pain. With increasing experience, we have become used to viewing with akepticism even the most spec tacular improvement in any patient because the same story repeats itself, namely, that patients, who had no complaints when last examined, so often return on the next revisit with severe pain and unable to walk without assistance.

In discussing the effect of hormone therapy on metastatic leanons, we disregarded the group of 19 patients who developed metastases while they were under treatment. The fact that metastases occurred in spite of treatment was interpreted as conclusive evidence that therapy was inaffective. Of the 54 patients who had metastases at the beginning of treatment, 49 had metastases to bone, 4 had metastases to lymph nodes, and 1 patient had metastate lung involvement. In one of the patients, metastate bone and lymph node involvement were present simul taneously.

Of the 49 patients with bony metastases, 8 had no pain throughout the course of observation in 3 patients, the intensity of pain remained essentially unchanged and further increase of pain in spite of treatment developed in 5 patients.

In the remaining 33 cases, more or less marked relief from pain was obtained — In 29 of this latter

group, recurrent pain developed after an average of eleven and one-tenth months. The results in the other 4 patients were as follows Relief from pam has persisted for thirty four and fifty months in 1 case each, 1 patient died of other causes after seven months, and in 1 patient, relief from pain was due to a metastatic lesion in the second lumbar vortebra with resultant paralysis of the lower extremities and chord bladder

The effect of treatment on the metastases proper seems to depend to a large extent on the sate of the metastatic lesion.

Further progression of old and development of new metastases in proviously not involved parts of the skeleton was the rule. However, various degrees of improvement in the roentgenologic appearance of bone lesions was demonstrable in 8 patients. In 2 of them improvement has persisted to the time of writing, while it was temporary in the other 6. Complete disappearance of bone metastases was not observed in a single case in our series.

One patient with metastages to lungs died after treatment without responding to hormone therapy

Five patients had metastatic lymph node involvement, one of them had bony metastases in addition to lymph-node involvement. Diagnoss was confirmed by biopsy in each patient. Response to treatment in this group of cases was excellent. Hormone therapy was ineffective in only one patient who was admitted in the terminal stage. Complete disappearance of lymph node metastases was accomplished in the other cases. So far, none of them has developed recurrences. It is of interest that the patient with bony and lymph-node metastases responded with disappearance of the metastatic lymph nodes, while slow progression of the bone lesions continued.

During the course of our investigations (and for two years before hormone therapy was introduced), we have carried out serum acid phosphatase determinations at regular and frequent intervals. From our studies on our patients with carcinoma of the prostate the following conclusions were made.

Decrease in the serum and phosphatase activity following castration and stilloestrol ad ministration occurs almost invariably if elevation is present. Decline is more precipitous after castration, but gradual decrease to normal or almost normal levels is accomplished also by exclusive estrogen medication

Determination of serum and phosphatase activity is of limited diagnostic value in patients who were proviously subjected to hormone therapy

Consistently high acid phosphatase levels, and

particularly continued increase of acid phosphatase activity, in spite of androgen control therapy, should be interpreted as an unfavorable prognostic sign even if the patient seems to improve It has been our experience that improvement in this group of patients was of short duration only

On the other hand, delayed failures may occur in spite of decrease of serum acid phosphatase to persistently normal values. Re-elevation of the acid phosphatase need not develop even in the terminal stages of the disease, however, during the course of prolonged studies we have observed subsequent elevation of the serum acid phosphatase to levels which exceeded the initial values.

In spite of its short-comings, which have become more and more apparent as time progresses. it can be stated that hormone therapy represents the most effective therapeutic measure available for patients with advanced and metastatic pros-A certain degree of disillusiontatic carcinoma ment, which has developed lately. stimulus not only act 88 8. plan androgen control therapy in accordance with certain indications, but it will also stimulate investigation to attempt to find supplementary measures which will improve or prolong the effect of this method of treatment

It becomes increasingly apparent that emphasis is being placed again on surgical procedures such as transurethral resection for relief of obstructive symptoms and perineal prostatectomy to try to accomplish cure in suitable cases cent reports by Scott and Benjamin, as well as by Parlow, are of interest in this connection These authors advanced the idea to attempt perineal prostatectomy after regression of an initially inoperable lesion has been accomplished by hormone therapy Scott and coworkers claim to have employed this procedure success-Although the time elapsed fully in some cases is too short to permit conclusions, it may be that this measure will offer future possibilities in patients with nonmetastatic disease However, in spite of sometimes very pronounced improvement of the rectal findings, it will be extremely difficult to determine whether or not extension of the disease into the periprostatic tissues with resultant fixation has regressed sufficiently to justify an attempt at surgery for the purpose of accomplishing cure

Investigations for the purpose of accomplishing more prolonged beneficial effect from hormone therapy are also under way in the field of endocrinology. It is well known that androgen activity does not entirely cease following castration, neither can it be depressed indefinitely by the action of estrogen.

Experiments of McCullagh and Daoust¹⁰

published as early as 1940, are of interest in this connection. They found that transient reduction of comb growth-stimulating androgenic hormones in the blood of rabbits took place following castration. However, it was demonstrated also that the amount of comb growth-producing hormones was restored, and remained restored one month later. McCullagh and Daoust concluded that these extragonadal hormones originated in the adrenals which were found enlarged with their average weight increased from 340 to 864 mg.

It is generally believed that the adrenals are the main source of androgens in the body, after orchidectomy. Certain evidence suggests the pituitary gland plays a leading part in the control or stimulation of androgen production, after castration. Following this idea we have attempted to depress this activity of the pituitary by giving external irradiation over the pituitary, particularly in patients who developed into delayed failures following castration therapy X-radiation treatment over the pituitary has also been employed by Herbst, 11 Angrist and Khoury, 12 Beatty, 13 etc.

Two hundred ky x-radiation (half value layer. 09 mg Cu, 50 cm skin target distance) was given and the pituitary was irradiated from two lateral and one anterior field A total of between 1,000 and 3,500 r was delivered into the region of Transient improvement from the sella turcica pain was obtained in about 50 per cent of the cases, but in none of them were we able to alter the course of the disease materially been our impression that the downhill course in delayed failure patients was slowed down substantially in some of the cases treated average survival time until death was twelve and three-tenths months after resurgent symptoms became manifest in a group of 20 patients who received x-radiation treatment over the pituitary, while an average of only seven and seven-tenths months elapsed until death occurred in an analogous group of 43 patients who received no such treatment

These results are by no means spectacular, but in our estimation they are sufficient to warrant continued investigations in this direction

Summary

A study of results obtained by hormone therapy in a series of 130 patients with prostatic cancer is presented. Treatment in these cases dated back to from two and one-half to four and onehalf years.

After initial benefit, resurgent symptoms develop in the majority of the cases after variable periods of time. This indicates that hormone

therapy in its present form does not cure nor does it retard the disease indefinitely

March 1, 1947]

In giving estrogen, small daily doses of 1 to 3 mg of stilbestrol are being recommended

Indiscriminate use of orchidectomy in patients with prostatic cancer is decried Castration should be reserved for patients in whom immediate relief from pain is desired or patients in whom estrogen administration has lost its effectiveness

Estrogen administration given in cases of fail ures following castration is usually ineffective while failures occurring following exclusive estrogen therapy show fair response to subsequent castration.

Androgen control therapy does not prevent formation of metastases in patients with apparently quiescent disease. Its value in this type of case is questioned and it is suggested to reserve hormone therapy until the disease shows signs of progression

Results accomplished by employment of x radiation over the pituitary are reported

certain degree of palliation with prolongation of life was accomplished by this procedure.

UNSTABLE KNEE DUE TO TEAR OF EXTERNAL COLLATERAL LIGAMENT WITH AVULSION FRACTURES

MILTON J WILSON, MD, FACS, New York City

(From the Orthopedic Department, New York Medical College, Flower and Fifth Avenue Hospitals, Metropolitan Hospital Division)

THE patient, H S, a woman, aged 33, was admitted to the Metropolitan Hospital on May 11, 1944, with a history of falling down a flight of stairs injuring the left knee

Evamination showed "marked swelling, no abrasions, and extension limited to 170 degrees, flexion was not attempted. Lateral mobility was equal on the two sides, and there was no anteroposterior play. There was marked tenderness over the head of the fibula."

Roentgenograms (Fig 1), May 11, 1944, showed complete avulsion of the left tibial spine as well as a small portion of the articular margin of the lateral tibial condyle and a fairly large fragment of the provinal end of the fibula. The tibial spine was not separated but the other fragments were widely so She was treated by aspiration of the knee and skin traction. The following morning, the knee could be fully extended but there was 20 degrees of lateral play. A cast was applied from the toes to the upper thigh with knee extended. She left the hospital on the eleventh day, and returned for removal of the cast after seven weeks.

Films dated June 29, 1944, show the tibial spine to be united and the other fragments rounded off, but still separated At this time there was no lateral play found in the left knee Weight-bearing was permitted on crutches and three months later these were discarded

At four months post-trauma, she was seen in Follow-Up Clinic and apparently had a good functioning knee Flexion was to 90 degrees on the left, 70 degrees on the right

Five and one-half months following injury she returned, complaining of a sense of insecurity in the left knee but no pain. There had been full weight-

bearing for almost three months

Examination showed 10 degrees of lateral motion and the tibia could be displaced somewhat forward on the femur Knee flexion was definitely restricted due to the sense of instability There was good biceps and quadriceps function, and no peroneal involvement

Roentgenograms, November 27, 1944, (Fig 2) showed the left knee in adduction resulting in marked separation of the lateral tibial plateau from the lateral femoral condyle. The fragments off the fibula and the tibial articular margin did not change position.

Operative intervention was indicated and the joint was approached through a lateral parapatellar incusion. The cruciate ligaments and the lateral meniscus were found to be intact. A lateral incision, extending from the fibular head along the biceps tendon, was then made. The fascia, the lateral ligament, and the attachment of the biceps tendon to the small avulsed portion of the fibular head were found lying above the tibial plateau and loosely fixed with fibrous tissue to the snyovia of the kneel joint. The fibrous tissue was resected, the bony

Fig 1 Avulsion left tibial spine, lateral border of tibial plateau and fibula at the attachment of biceps tendon

fragments freshened up, and the bone fragment of the fibula was attached to the tibial condyle with two 1-inch Vitallium screws and chromic catgut. The wound was closed and a long leg cast applied with the knee in abduction and 15 degrees flexion. Postoperative course was uneventful. The cast was changed after seven weeks

Fig 3 shows the condition at this time, the fragments of the fibula and of the tibial condyle held in contact with the tibial condyle by two small Vitallium screws Films taken

February 19, 1945, appear the same

Progress note made five months after the last operation showed 5 degrees lateral motion, 175 degrees extension, and 90 degrees flexion. She walked well and had lost the feeling of instability. There was no pain and no limp

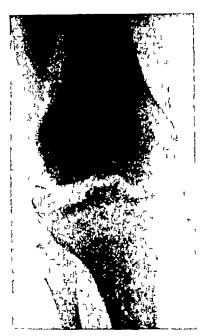

Fig. 2 Left knee in adduction showing widening of the joint space laterally

She returned to work seven months postopera tively and at fourteen months was found to have complete range of flexion and extension with no lateral instability

Fractures of the tibual spine are rather common, arulaion fractures of the fibula are rare and the combination of both is certainly extremely rare While knee instability is usually considered due to torn cruciate ligaments in this case it was due to avulsed lateral ligament and biceps tendon.

It is difficult to account for the mechanism of the injury. The anterior crucial ligament is attached to the tibial spine and the lateral ligament of the knee joint and the biceps tendon are inserted into the head of the flyula.

POSTGRADUATE COURSE IN RADIOLOGY

One hundred radiologists will be selected to attend the postgraduate course in radiology to be conducted March 30 through April 4 in Philadelphia by the American College of Radiology

Preference will be given to radiologists who served in World War II. Second preference will be given to qualified applicants who were unable to obtain admission to last year's course in Philadelphia. The course is spomsored

Fig 3 Postoperatively showing fixation of the avulsed fragments laterally and correction of the instability

The violence necessary to produce the injuries sustained in this case must have been either foreble adduction of the extended knee avulsing the lateral ligament and the biesps tendon with their bony at tachment and then foreible shifting forward of the tibla placing strain on the anterior cruciate and pulling off its bony attachment, or foreible internal rotation pulling off the biceps and its bony attachment, and the external femoral condyle knocking off the tiblal spine.

The patient walks without a limp has no complaints, and examination shows no residual disability

1000 Park Avenue

jointly by the American College of Radiology and the Philadelphia Roentgen Ray Society

Some of the subjects to be studied are certain neoplastic and inflammatory disenses, carcinoma of the head and neck, doesge calculation and tumor sensitivity in radiation therapy carcinoma of the breast, blood and hemopoetic diseases, carcinoma of the genital and urnary tract, bonign and malignant diseases of the akin.

CONFERENCES ON THERAPY

DEPARTMENTS OF PHARMACOLOGY AND MEDICINE, CORNELL UNIVERSITY MEDICAL COLLEGE AND THE NEW YORK HOSPITAL

THESE are stenographic reports of conferences by the members of the Departments of Pharmacology and of Medicine of Cornell University Medical College and New York Hospital, with collaboration of other departments and institutions. The questions and discussions involve participation by members of the staff of the college and hospital, students, and visitors. A selected group of these conferences is published in an annual volume, Cornell Conferences on Therapy, by the Macmillan Company. The next report will appear in the June issue.

The Rational Use of Cathartic Agents, Part II*

DR HARRY GOLD The conference last week dealt with the subject of the rational use of cathartic agents Consideration was given to the choice of cathartic agents for particular problems. the methods of bioassay of these agents, the role of cathartics in the cause as well as in the relief of constination, the actions of the gum lavatives. the irritant lavatives, and the salines, their mechanisms of action, the problem of griping after cathartics, and some of the toxic effects which are not commonly considered in the routine use of ensom salts There seemed to be several points of interest in need of further discussion. but the time was too short to take them up hope to be able to explore these matters in the conference today

DR KIRBY A MARTIN In relation to Dr Heffner's discussion, I wish to point out that one should differentiate between bulk and roughage The literature is confusing on this point, since some authors use the terms interchangeably A stool may be large or small in volume depending upon the amount of cellulose in the food — It may be smooth or rough depending upon the kind of cellulose consumed

A few years ago Olmsted classified the cellulose content of a few of the common vegetables into cellulose, hemicellulose, and lignin ample, the pulp from sugar beets, carrots, and cabbage is composed of hemicellulose stance is hydrophilic, and in the intestinal tract it supplies an increased bulk to the stool that is smooth and resembles the effect of agar other hand, bran, classified as a lignin, produces a bulky but rough stool In the gastrointestinal clinic here, where we prescribe diets for constipation very frequently, a few years ago we coined the word "smoothage" to designate these smooth bulk-producing substances, because there was no word in the English language to portray the opposite of roughage

The gums referred to by Dr Heffner are hydrophilic substances, and in the intestinal tract produce a bulky smooth stool They may be used to advantage in selected cases, but why pay a high price at the drugstore for substances brought from the four corners of the earth when the same effect may be derived, in a more pleasant and economical way, by using the vegetables containing hemicellulose? Of the many vegetables that you may buy on the market that yield as good smoothage as anything that you buy at the drugstore, the first probably is the carrot smooth, hydrophilic, and it is like cold cream when it reaches the colon Cabbage is also excel-I horrify everybody when I say that I feed all of my ulcer patients raw cabbage, cole Cooked cabbage is less useful because cooking releases volatile oils which are irritant

It is strange that so little emphasis has been placed upon the organism itself as a bulk pro-For example, a patient taking no food by mouth may continue for days to pass a large, normal-appearing stool, the composition of which may be not unlike that of a patient on an adequate but low residue diet. Where does this voluminous stool come from? It is made up from the normal secretions of the intestinal tract plus Secretions and bacteria may each account for as much as 25 per cent of the dried weight of a low residue stool In certain cases, however, mucus is secreted in excessive amounts and it is said that the patient has "mucous colitis" This is now looked upon as an advanced state of a spastic colon The cause may be in the colon itself, but may be and frequently is due to a disturbed motility higher in the intestinal tract Observations also indicate the existence of the opposite type of patient, who seems to have too little intestinal secretion

If we knew more about the effect of foods and drugs upon the control of intestinal secretions, we might find a simple way of correcting certain types of constipation For example, the protein

^{*}Part I of this Conference appeared in the February 15 issue of the JOURNAL.

foods definitely stimulate intestinal secretion and increase the bulk of the stool

DR. THOMAS ALMY It seems to me that the use of high residue and low residue diets should be considered in relation to the kind of functional constipation which the patient has that is, whether it is atonic or spastic. The textbooks give us a simplified differential diagnosis of these two types on the basis of ago, body build mood tension, and vasomotor stability of the patient, together with the findings on proctoscopy and x ray visualization by a barium enema

In the atonic type of intestinal stasis the first matter of importance is to provide adequate indigestible bulk in the form of a high residue diet with a large quantity of fluid One need not issue extensive diet lists for this purpose most patients it will be enough to insist they have three pieces of raw fruit a day four servings of vegetables, and five or six slices of whole wheat bread, together with three quarts of liquids in twenty four hours, if there is no contraindication to the latter The amount of bulk in the intestine may also be increased by the use of one of the gums. I believe the most popular substance of this sort at present is a purified derivative of psyllium seed, of which there are several brands on the market. The standard procedure is to suspend one to two heaping teaspoonfuls of the material in a glass of cold water, to be swallowed rapidly and followed by another glass of water, one-half hour before breakfast However, the only type of laxative which we have used exten sively in this group of patients over long periods of time is milk of magnesia, which provides fluid bull. Occasionally, mineral oil has been found rather effective in making the expulsion of feces entier, and one to two tablespoonfuls may be taken nightly at least three hours after eating Separation from food is, of course, important in order to minimize the loss of the fat-soluble vitamins which Dr Travell has mentioned Some patients get along well on the use of a simple tap water enema, every third day if necessary

It is generally considered at present that in the majority of patients with spastic constipation the primary exciting cause of disturbed bowel function is nervous tension, and the first consideration is to remove the cause of the nervous tension with psychotherapeutic devices, which might be termed 'emotional catherss' To reduce the irritability of the bowel directly, first, provision should be made for a low residue diet to reduce the bulk of the fecal mass and, second, unnecessary irritation of the colon from spices, pepper and sauces, and especially from laxatives and irritant enemas should be avoided Jacobson has shown that the tone of smooth muscle is in some way related to the tone of skeletal muscle,

and has had some success in alleviating states of hyperirritability of smooth muscle, such as an irritable colon, by routines which establish skelotal muscle relaxation. This can be accomplished by physical therapy of the type available in the hospital and also by homemade physical therapy in the form of tepid tubs and unskilled massage Relaxation may be further augmented by mild regular exercise. Finally, the use of antispasmodics, such as belladonna and syntropan, or the use of mild sedation with phenobarbital, has, in the belief of many physicians, been attended by additional improvement in spastic constantion

I know that many doctors of experience use agar psyllum seed, and other such substances in spastic constipation, in order to provide smooth bulk. I have never tried this myself because I could not see the physiologic basis for it, since we are actually trying to diminish the stimulus to reflex hypermotility

DR TRAVELL There are two kinds of intestinal motility, first, the propulsive type, and second, the segmental or tonic contraction, and it is quite possible that an increase in bulk may increase peristals is without increasing spasm. The stimulus which normally initiates the propulsive wave is probably stretching of the muscle fibers of the gut.

Dr. Gold Let us see if we have that straight. Dr Almy would not use bulk in so-called spastic constipation because that tends to increase the stimulus to the gut which is something he tres to avoid Dr Travell's point is that if the stimulus is a propulsive one it might not be contraindicated in this type of constipation

DR. SYDNEY WEINTRAUB Are we not confusing bulk and roughage? I think that in the spastic colon it is not a question of how much bulk there is, but a question of how coarse the residue is Don't you agree with that?

DE TRAVELL That is exactly my point In creased bulk, it is smooth may stimulate peristalsis, whereas if it is rough, it may act as an irritant and set up spasm

DR WEINTRAUB And we usually give agar and similar materials to increase the bulk because it gives not roughage but smoothage, as Dr Martin calls it.

DR. ALLY I would say that obviously rough age is contraindicated, but one can see reactive spasm in the constipated bowel after two very bland agents which cause distention. One is barium and the other is air introduced through the proctoscope.

The sample blowing of air into the rectum of the patient with spastic constipation will often result in so much spasm that one cannot get past the rectosigmoid junction. I wonder, therefore, if the distinction which you have drawn between the

effect of smooth bulk and rough bulk is valid?

DR TRAVELL Sudden distention of the gut by blowing it up with air might produce an entirely different effect from the gradual distention which follows the introduction of material by mouth

DR MAURICE TULIN Most of the agents used to provide bulk are smooth only in comparison with the whole fiber of cellulose Actually, microscopic examination of the feces frequently reveals small but intact particles of cellulose, and after a good many of the agents that yield smoothage, fairly large-sized particles are seen As yet I am unwilling to differentiate the rough uncooked vegetable from the smoother cooked vegetable because I doubt whether microscopically there is a significant difference at the time the meal has reached the colon

STUDENT Dr Almy spoke of the use of antispasmodics in spastic constipation. Does anyone have any success with the parasympathomimetic drugs such as prostigmine in atonic constipation?

DR ALMY I cannot answer that I would be glad to hear what Dr Weintraub has to say

DR WEINTRAUB We almost never see atonic constipation One should be able to demonstrate an atonic colon in the x-ray examination, but one very rarely sees the bowel atonic in these cases

DR BARR You mean that you don't use parasympathomimetic agents for constipation?

DR WEINTRAUB That would be my answer to the question

DR BARR Does anybody use them?

DR MARTIN No

DR TRAVELL No, except in the intestinal stasis of postoperative ileus

DR WEINTRAUB Yes, I think that is the only time you would use them I would like to ask Dr Almy what he thinks are the proportions of patients with the two kinds of constipation, atonic and spastic, as he sees them in the clinic?

DR ALMY Most of our patients are quite young, and I think that we see more spastic than atonic constination

DR WEINTRAUB I asked that question because there are some who maintain there is no such thing as atomic constipation. They say that stasis is always due to some spastic phenomenon somewhere along the gastrointestinal tract

DR BARR Are you one of those?

DR WEINTRAUB I am one of those I say that atonic constipation is very, very rare, except in debilitated people who are in bed and have some chronic disease

DR BARR How about Dr Martin?

DR MARTIN The literature is very confused as to the meaning of the terms atomic and spastic colon in relation to constipation I am con-

vinced that this classification serves no useful There are no atonic colons in constipation except the few congenital anomalies Otherwise, the colon is always spastic in constipated persons This confusion came about early in the use of x-ray studies of the colon authors studied the colon by a motor meal and others by a barium enema. The colon which appears overstimulated or spastic as judged by a motor meal may appear atonic by a barum The first technic is useful to study function, whereas the second is useful to rule out the presence of organic disease The two technics are not comparable Furthermore, by means of a barium enema, one cannot differentiate radiographically a spastic colon with constinution from a colon in which diarrhea is present both spastic

STUDENT I would like to hear a definition of chronic constipation in the ambulatory patient in whom organic disease has been ruled out

DR. BARR Who will give us such a definition? DR ALMY I think that for the most part we should take the patient's word for it, because if the patient comes here complaining of constipation, he needs an explanation of what is wrong with his bowels as he sees it — In the patient who is mildly constipated that usually means insufficient quantity of feces — Of course there will be a certain number of patients who are having one or two perfectly adequate bowel movements a day, and to whom after a reasonable investigation one has to say that he is not constipated

Hurst has defined constipation as a failure of ingested charcoal to be passed within about forty hours. We use carmine as a marker in studying delay in passage of fecal material, but it is rarely necessary to study the actual passage in order to decide whether treatment is necessary.

Dr. Martin I knew that someone was going to ask the question, "What is constipation?" so I looked it up in Webster's dictionary, Cecil's, Alvarez', Winkelstein's, and in several other texts, one of which I had something to do with, and they left me hopelessly confused I would be ashamed to read the definitions that I found, and I won't waste your time in doing so

In relation to this question, I would prefer to answer it another way. It helps if one regards constipation as a change in the bowel rhythm A disturbance in function may manifest itself, first, as a change in the rate of flow, that is, either diarrhea or constipation, second, as a change in the character of the contents, that is, an increase or decrease in fluid, or third, by the presence of blood, mucus, or pus. It should be noted that the spastic colon may result in either diarrhea or constipation.

Dr. LAWRENCE W HANLON Hurst says that

the patient usually regards himself as constipated because he takes physics, and is really suffering from "a self induced diarrhea." He describes the sufferers as hypochondriacs who have their own idea of ideal stool size, and must learn there is no standard size, shape, color, or consistency He says that they "should learn to follow the example of the dog instead of the cat, and never look behind them."

STUDENT How long may a patient go without a bowel movement and still be considered normal?

Dr. Martin We had a 17-year-old boy who had normally a rhythm of one bowel movement every fourteen days brought to the clinic by his mother A gastrointestinal x ray series was reported as normal after castor oil preparation. Motor meal studies after one, three, five, and six hours as well as a barium enema, showed nothing abnormal We were unable to get further studies. This patient was entirely satisfied with the attuation and had no symptoms

DR ALLY I think cases are recorded in the literature in which patients have gone six months without a bowel movement and did not come to

any violent end

DR. TRAVELL Reports on survivors on life rafts in the Pacific contain accounts of many weeks without a bowel movement.

Dr. Gold It would almost seem as if having a bowel movement is not essential

Dr. Martin Dr Hauser made a report on the people on life rafts and many of them had a normal movement every day, even though there was no food That is easy to understand if you appreciate what the bulk of the stool is made up of one-third bacteria, one-third secretion and probably one-third food residue If you cut out one-third by the absence of food, the remainder may still be enough for a simble stool.

DR WEINTRAUB Actually, constipation of itself does not hurt most of these patients, but it is their reaction toward constipation induced by what they read about it on the subway cards, what they read about it on the subway cards, what they hear over the radio, as to the terrible things that happen to people when they are constipated, that is harmful They are told that they are full of poison, and they begin to believe it and worry about it That is the point that Dr Almy tried to bring out, and that is why these people come to the doctor and to the clinic seeking relief It is because of their fear I think that Dr Houston's definition of constipation is a good one, namely, it is the colonic manifestation of a psychoneurosis

Dr. Goto I should like to ask Dr Almy again what he does specifically to relieve the constipation in a patient in whom, for one reason or another, dictary regimen, exercise, and psychologic measures have not solved the problem

DR. Alarr In the hospital we do leave a standing order for milk of magnesia and mineral oil if necessary If that is ineffective, we use an enema.

Dr. Gold What does one do in the outpatient department, or in the cases of ambulant patients one sees in the office?

DR. ALMY The enema is still the best answer DR GOLD The patient might have to take one three times a week. Is that all right?

DR ALMY Yes

DR. MARTIN Dr Bastedo, in reviewing the subject a few years ago, said, 'Why upset 35 feet of intestine when the trouble is within 8 inches of the rectum?" As Dr Almy has pointed out, the use of an enema is often more rational than a cathartic

DR CATTELL Does not constipation usually take care of itself?

DR ALMY It depends upon how willing patients are to follow advice. Many patients are incapable of accepting the idea that they may go more than one day without a bowel movement. Sometimes they will never restore the normal pattern of their bowel function because they are afraid

Dr. Gold What proportion of patients who complain of constipation end up still having constipation after you have prescribed dietary regulation, extra fluid, bulk factors, and psychotherapy? How many end up with constipation and need a laxative for relief?

DR WEINTRAUB I would say very roughly, based on experience in private practice, at least 25 per cent, or maybe more These patients may follow the regimen for a while, and it works But when they seem to let down, they stop taking the agar, stop exercising Then they decide one day they need a good cathartic, so they take one, and then the whole cycle is started all over again. There is no bowel movement for two or three days after the cathartic, so they take another dose and come to you again, with the story, "I am back in the old bad habita." Then you have to start explaining things and putting them on the regimen all over again.

DR. GOLD I should like to ask the question in another form In what proportion of the chronic constipators that come to your office do you prescribe a laxative?

DR. WEINTRAUB As a rule only to elderly people, who have taken cathartic pills all their lives and who have found if they take 10 or 15 grains of cascara or some other favorite pill they get along all right.

I have learned from experience that it is usually hopeless to try to put these people on a general regimen, so we allow them to take their pill Honever in the younger people and intelligent people

you can correct constipation by physiologic measures

DR Gold When you say you allow them to take their pill, you mean you don't change the preparation?

DR WEINTRAUB I don't change it

DR GOLD There is no basis for choice among the pills for chronic constipation except the patient's own experience and preference?

DR WEINTRAUB That is right

DR MARTIN Dr Almy expressed a preference for milk of magnesia We have found that milk of magnesia produces cramps in many instances, and that cascara is better tolerated by the spastic colon

DR ALMY Why is cascara preferable to milk of magnesia?

DR MARTIN Because in average doses it does not ordinarily produce cramps

DR GOLD There is the point that cascara exerts its effect by virtue of local irritation in the large bowel, while milk of magnesia, like other salines, acts through osmotic retention of water, and the effect is that of bulk

DR TRAVELL It has been shown that as soon as cascara reaches the colon, the small intestine is also stimulated due to the coordinating reflexes of the gut

However, the stimulation of the small bowel after administration of cascara occurs later than after the administration of the saline cathartics. This could help to explain why the salines might cause cramps and cascara might not

DR GOLD I am certain that cramps may be caused by all of them if the doses are large enough Is drinking water of any virtue in constipation?

DR MARTIN I have never been impressed that, within normal limits, the amount of water a patient takes has any effect on constipation

Summary

DR TRAVELL The discussion this afternoon and in our conference last week dealt with one of the most common problems of every day practice, namely, the use of cathartics Among the various topics there were these questions When is a patient constipated? Is constipation a matter of frequency of stool, quantity of stool, or consistency of stool? How much validity has the classification of spastic and atonic constipation? Should constipation be allowed to right itself or should patients be encouraged to do something about it? When should one resort to laxative agents? What is the basis for a choice among laxative agents?

These and related questions were explored in the endeavor to crystallize a more rational

system for the management of constipation problems than seems to be the general practice

A satisfactory definition of constipation appears to be difficult to obtain. Perhaps the one which defines it in terms of a deviation from the individual's own bowel rhythm comes nearest to the true description of the constipated state. The view was expressed that the vast majority of cases of constipation are spastic and that so-called atonic constipation is only rarely encountered, and more often in relation to organic diseases.

That constipation is in a large measure a state of the mind is widely accepted. Patients have come to regard a deviation from their usual bowel rhythm with apprehension, and the harm which results from constipation seems to be largely a fear of harm and an anxiety concerning it rather than actual damage to health. Emphasis was placed on the need of educating the patient who complains of constipation with respect to the hygienic measures likely to lead to more regular bowel action, namely, systematic habits, diet, physical evercise, and psychic reactions

The numerous types of lavative agents were considered, namely, the irritant cathartics like cascara, senna or phenolphthalem, the salmes, the bulk-producing gums, and mineral oil While there is need for several cathartic agents, the vast numbers of such agents and mixtures represent needless duplication and are a source of confusion

The few special indications for one or another of these agents were discussed, but, for the most part, little is known concerning, the mode of action, and the selection of a cathartic agent for any particular individual appears to be a matter of trial and error The patient's own preference is often allowed to play an important part in the choice of a cathartic agent was directed to the view that in most instances the dose is a more decisive factor in obtaining satisfactory results than the type of cathartic, for most of them appear to be capable of producing It was pain and griping in excessive dosage urged that more effort be made to establish the proper dose of any one agent than to shift from one to another as a means of securing the best Habituation to cathartic agents occurs, and the use of cathartics may itself promote constipation

There is great need for scientific comparisons of the potency of cathartic agents. Most animals are unsuited for such comparisons. The Rhesus monkey appears to respond in a manner similar to the human. The constipated human subject should be put to use more systematically than has been the case in the bioassay of cathartic agents.

IF YOU HAVEN'T SEEN THIS ELSEWHERE

Awakening of Our Sense of Duty

The most casual analysis of the results of the last election reveals how wide is the swing of the pendulum of public opinion. The time is here when medicine should give thought to and openly take part in the science of government, call it politics if you will. No group of men should be more interested in the government of this country. No group is more qualified to distinguish between the charlatan and the sincere politician. If we state that we fear soling our fingers by mixing in politics we are virtually saying to the ward-healers and corruptionists, "You run it." We should make it our business to assure ourselves that the men we choose to enact our laws and those we select to enforce them are clean able, and honest that they believe in America and in those principles of government which we call American.

The prestige of the doctor as an individual, and of medicine as a group is indeed great. What are we going to do with that prestige? Are we going to use it to help retain in this country the fundamental principles which made thus the greatest nation the world has ever known? Are we going to use that prestige for selfish purposes? Are we going to use that prestige for selfish purposes? Are we going to fail to carry the load of responsibility to society that this prestige has placed upon our shoulders? For surely prestige over carries with it a like responsibility

It is my firm conviction that we as a group will accept our responsibility Today, ideologists are striking at the very roots of free enterprise Socialization of medicine happens to be their immediate goal. It is but an incident in their program. It must be defeated, not for selfish reasons, but because it is a threat to our way of life. While the ideologists may have lost one battle in the recent

election we may be sure that they do not consider they have lest the war. They will be back with more ammunition and with more strategies for the next battle. Complexency on our part at this time may woull ultimate disaster.

may spell ultimate disaster

The welfare of society and the walfare of medicine
go hand in hand. They cannot be divorced. Society
depends upon medicine and medicine upon society
If we sublimate our own interests in our fight for the
interest of society we need not worry about the effect
on medicine.

The strength of medicine is not in the few who hold the higher offices, or in members of committees. Neither is the strength of medicine in the teachers and the scientific researchers. The strength of medicine is in the membership of the county sociotics, those men scattered throughout the state in the metropolitan areas and the rural districts. The prestige of medicine is built upon the lives of these men, and upon these men we must build our hopes of the survival of our present form of medical practice and free enterprise. It is upon the level of the county societies that the battle must be fought and wen.

We need an awakening of our sense of duty to our country along this line and it will be one of the objectives of this administration of your Society to do everything within its power to aid in such an awakening —C. A.Dawson, M.D.

everything within its power to aid in such an awakening.—C. A. Dawson, M.D.

Correspondence

In the January 1, 1947 issue of the Journal, page 69 the city of Rome was arroneously included as revealed by the following letter We are pleased to make the correction.—Editor

To the Editor

My attention has been called to the article in the January 1 issue of the New York State Journal Or Medicine on the new domestic coverage in work men s compensation I find that through an error in reading the 1940 census population of Rome, you have announced the law as applicable to 18 cities in the State instead of 17 cities, as the Board has an nounced

While I am of course glad to have employers of domestic workers in Rome take out workmen a compensation insurance if they wish to do so, I think you will agree that it should not be announced to them as mandatory and this the Board has not done.

Very truly yours,
(Signed) Mary DONLON
Chairman
Workmen s Compensation Board
New York State

New York City 13

Under the above caption, we plan to publish from time to time, excerpts from the editorial pages of our contemporary State Journals

DEPARTMENT OF THE VETERANS MEDICAL SERVICE PLAN, INC.

Report to Physicians with Suggestions Regarding Procedure

GEORGE HUNTER O'KANE, M.D., Med Sc.D., Coordinator Veterans Medical Service Plan of New York, Inc., and Frederick E. Lane, M.D., Chief of Outpatient Division, Veterans Administration, Branch Office No 2, New York City

A RECENT survey indicates that there are approximately 1,940,000 veterans in the State of New York while there are only about 370 physicians new York while there are only about 3/0 physicians employed by the Veterans Administration on a full-time basis. In addition, there are approximately 700 consultant and part-time physician employees Among the veterans in the State of New York, approximately 350,000 have service-connected disabilities It was obvious, therefore, that this small number of physicians in the Veterans Administration employ could not adequately care for the veterans in the State of New York. For that

veterans in the State of New York. For that reason, the medical profession was called upon. The Medical Society of the State of New York promptly cooperated by sponsoring the Veterans Medical Service Plan of New York, Inc. This nonprofit corporation entered into an agreement with the Veterans Administration on August 7, 1946. Under the terms of this agreement, the 27,000 physicians who are licensed to practice in the State of New York are automatically eligible to participate in the plan to treat veterans with service-constant. pate in the plan to treat veterans with service-connected disabilities From the time of the inception of the plan on September 16, 1946, up to January 1, 1947, approximately 50,000 veterans have received treatment under this plan at an expense to the Veterans Administration of approximately \$1,500,

The New York Plan differs from the plans in other states in that there is no administrative intermediary agent Instead, coordinators who are em-ployed by the Veterans Medical Service Plan supervise the ethical and professional conduct of the physicians participating and act as haison between the veteran, the Veterans Administration, the in-dividual doctor, and the Medical Society of the State of New York

The Michigan plan, for example, includes a surcharge of 8 per cent for administrative work. By the elimination of this administrative intermediary, the New York Plan has already realized a saving of over \$100,000

During the months the plan has been in operation, every effort has been made to minimize "red tape" However, a certain amount of paper work and conformity is required, masmuch as it involves the expenditure of government funds. In an effort to clarify and simplify the work of the participating physician, the following suggestions are made (1) It is apparent that the space allowed for clinical findings on the authorization form NY10-104 may often prove madequate In this case, the physician is urged to append a more complete report on his own letterhead similar to a letter he would write to inform a colleague regarding a patient's condition and prognosis

The individual doctor is urged not to undertake procedures, surgical or otherwise, which are not specifically authorized Prior authorization should

be obtained in each case so that the Authorizing Physician may determine the service-connection in advance This will further assure the doctor of payment for his authorized services When one doctor wishes to refer a veteran patient to another doctor for consultation or treatment, he should contact the Authorizing Physician in his locality so that separate authorization for the second doctor may be

issued directly to the latter

As it was stated previously, all licensed physicians are ipso facto participating physicians under the Veterans Medical Service Plan However, provecerais ineuroal service Plan However, provision has been made for proper financial recognition for services by specialists The standards of specialization are as follows FACS, FACP, certification by an American Board, or an S rating under the New York State Workmen's Compensation Bureau. Doctors who obtain recent certification by American Boards in their respective specialties or who secure an S (specialist rating) under the Compensation Bureau are urged to convey that information by letter to the Coordinator in their district so that their names may be added to the appropriate panel of specialists

Authorization for major surgical procedures is issued only for disabilities which have been adjudicated as service-connected with the exception of emergency conditions which appear to have a prima

facie service connection

The participating doctor may not transfer an authorization to another doctor Patient must obtain a new and separate authorization to consult another doctor if the original doctor authorized is unable to, or does not choose to accept him as a patient Authorizations are made out to the doctor of the veteran's own choice The Authorizing Physician is specifically instructed not to direct him to any particular physician In short, no channel-ling of cases is permitted

Doctors are urged to note the dates limiting the authorization and are urged to secure further authorization if continuation of treatment is indicated beyond the expiration date on the original authoriza-

Authorizations should be secured by the patient preferably by applying in person to the Authorizing Physician in his district Subsequent authorization for treatment of the veteran may then be obtained by his physician, preferably by a mailed request or

m case of emergency, by telephone

Prescriptions—Physicians authorized to treat
veterans under the Veterans Medical Service Plan
are also authorized to prescribe for them When
issuing a prescription, the physician must inscribe
the prescription with the following statement "I
am authorized by the Veterans Administration to am authorized by the Veterans Administration to treat and prescribe for this patient" Not more than one prescription should be put upon an R

POSTGRADUATE MEDICAL EDUCATION

Programs arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this Section of the Jounnal. The members of the committee are Oliver W H Mitchell M.D. Chairman (428 Greenwood Place, Syracuse), George Bachr, M.D., and Charles D Post, M D

Joint Meeting of Chemung County Medical and Dental Societies

DR. STUART L. VAUGHAN, assistant professor of medicine, University of Buffalo, School of Medicine, will speak on March δ in the Mark Twain Hotel, Elmira, at 6.30 p M

Dr Vaughan will discuss "The Hemorrhagic Disorders" before a joint meeting of the Chemung County Medical and Dental societies.

Instruction for Richmond County

O'N MARCH 6, Dr Samuel Klemberg, of New York City will present a lecture entitled 'Back Pain," to the Medical Society of Richmond County Dr William Goldring associate professor of medicine, New York University, College of Medicine, will speak on the subject of glomerulonephritis on March 13

"The Peptic Ulcer Problem will be presented on March 20 by Dr Albert F R. Andresen, professor of clinical medicine, Long Island College of Medicine.

These postgraduate instructions will be held in the auditorium of the United States Marine Hospital Stapleton Staten Island, at 3:30 PM.

VETERANS MEDICAL SERVICE PLAN, INC

[Continued from page 510]

blank. The doctor is not limited in the type of medication which he may prescribe, but only the following medical requisites may be issued on prescriptions insulinayingeand two needles, two hypodermic (insulin type) needles atomizer, nebulker, hot water bottle, fountain syringe combination hot water bottle and syringe, ice bag, ice cap urimal bed pan, enema can, foeding can and car and ulter syringe.

In conclusion the cooperation of the members of the profession to date has been wholehearted and this has been appreciated by both the Veterans Administration and the Veterans Medical Service Plan of New York State, Inc.

(For lack of space it is not possible to include here the 'fee schedule. 'This will be distributed to physicians at a later date)

Termination of Future Payments to Physicians for Drugs Dispensed by Them 10 Course of Treatment

THE following telegram from the Chief Medical Director, Central Office, is quoted for information and guidance of physicians

My attention has been directed to practice in a few states wherein fee basis and designated physicians claim and are reimbursed for drugs dispensed by them in course of treatment stop provision for payment to Doctors for drugs dispensed was considered only as expedient prior to completion of state pharmaceutical association agreements to supply prescription service to eligible veterans through participating pharmacies stop all states except Virginia, Delaware, New Mexico Novada, now under such agreement with VA stop last three states expected to cooperate soom stop last three states expected to cooperate soom stop Doctors normally dispensing own drugs should

consider routine nonexpensive drugs given to pattent as covered by their bade professional featop this is believed to be general practice of dispensing doctors with other than VA beneficiaries stop prescriptions may be written for any medication indicated for filling by VA pharmacy or participating pharmacy under State Pharmaceutical Association Plan stop practice of reimbursing physicians for drugs dispensed threatens with a featop the state Pharmacy Associations from plan which would deprive veterans of hometown pharmacy service stop request immediate attention to discontinue future payments to physicians for drugs dispensed by them.

FREDERICK E. LANE, M.D.

MEDICAL NEWS

Conference on the Medical, Legal, and Social Approaches to the Problems of Inebriety

N JANUARY 8, 1947, sixty city, state, and out of state leaders in medicine, law, welfare, labor and management, and religious groups convened at the New York Academy of Medicine at the invitation of The Research Council on Problems of Alcohol and the Academy's Committee on Public Health Relations

They discussed the recent study, "A Survey of Facilities for the Care and Treatment of Alcoholism in New York City," published by the Journal of Studies on Alcohol, Inc., conducted by the Committee on Public Health Relations of the New York Academy of Medicine, on the inadequacy of hospital and clinic facilities for the treatment of alcoholics in the City of New York. At the conclusion of the all-day conference, ten resolutions were passed calling for

Continued attention to the medical problem of alcoholism on the part of the New York State and

County Medical Societies of the City of New York.

2 The practical implementation of the recommendations of the Academy of Medicine report and of the joint study on "Institutional Facilities for the Treatment of Alcoholism," prepared by the American Hospital Association, by the State and County Medical Societies of Greater New York

The appointment of a continuous interagency committee with representatives from the American Hospital Association, the New York Academy of Medicine, and the New York State Medical Society

The appointment of a state commission to

study this problem

The creation or revival of the Board of Inebriety in amended form in the City of New York for the purpose of establishing suitable facilities for the care of alcoholic patients which will serve as pilot plans or guides for the rest of the State

A larger and more representative conference with the view of further public implementation of

the recommendations in the Academy report

The reactivation of the Committee on Hospital Treatment of Alcoholism of the Council of Professional Practice, American Hospital Association, to cooperate with The Research Council on Problems of Alcohol in the formulation of constructive programs of hospital care for alcoholic patients

8 Such standardizing bodies as the American Medical Association and the American College of Surgeons to review and/or establish minimum stand-

ards of hospitalization for alcoholic patients
9 The New York State Hospital Association,
the American Hospital Association, the American College of Hospital Administrators, and the Greater New York Hospital Association to encourage their member hospitals to care for and treat alcoholics both on an inpatient and outpatient basis

Society for Study of Sterility to Hold Convention

THE third annual convention of the American Society for the Study of Sterility will be held at the Hotel Strand, Atlantic City, New Jersey, on June 7 and 8, 1947, preceding the annual A.M A. Convention.

The general theme of the meetings will be that of attempting to disseminate to the phy-

sician treating marital infertility an over-all picture of the latest advances in reproduction Registration for the sessions is open to members of the medical and allied professions

Additional information may be obtained from the secretary, Dr John O Haman, 490 Post Street,

San Francisco 2, California

Personalities

Dr Frank R. Ober, assistant dean of Harvard Medical College and professor of orthopedic surgery there, spoke at the recent third annual conference on the treatment of poliomyelitis at Sunny View Hospital in Schenectady Dr Ober discussed the acute treatment of poliomyelitis

Dr James F D'Wolf, Dr John R. Emery, and Dr Harry Klapper were recently reappointed to the Medical Board of the City of White Plains for twoyear terms

Dr Alden J Townsend, health officer of Dansville, outlined the disadvantages of socialized medicine to members of the Rotary Club in that town at one of their recent meetings

Dr John F Rogers, of Poughkeepsie, will become Dutchess County medical examiner when Dr Samuel E Appel, of Dover Plams, retires May 31 Dr Rogers is a diplomate of the American Board of Obstetrics and Gynecology and a Fellow of the American College of Surgeons He served in the Navy Air Force during World War I, and was a lieutenant colonel in the Army Medical Corps in the recent war

Dr James E Fish, director of Ellis Hospital, Schenectady, was recently named an associate professor of medical administration on the staff of Albany Medical College

Dr Fred F Pipito has succeeded Dr R H Juchli as authorizing physician for the Veterans Adminis-tration in Amsterdam Dr Juchli resigned the post on January 1

Dr I Irving Vies, of Albany has been named a Fellow of the American Academy of Optometry as a result of outstanding research and work in the field of telescopic lenses. The honor is the highest in the field of optometry

Dr B F Markowitz, of Albany, has been named a Fellow of the American College of Allergists. Dr Markowitz served in the Army for three and a half years with the rank of major

Dr John A. Cetner of Albany was recently named a Fellow of the American College of Surgeons at Cleveland.

Dr Leslie A. Osborn of Buffalo has been promoted to full professor of psychiatry and mental hy giene on the staff of the University of Buffalo School of Medicino Dr Osborn, who has been acting head of the department of psychiatry and mental hygiene and director of psychiatry at the Meyer Memorial Hospital is a native of Australia. He came to the medical school in 1941, after several vears of general practice in Binghamton and on the staff of the Willard State Hospital.

Dr G Newton Scatchard, of Buffalo, was recently made acting head of the department of radiology at the University of Buffalo, School of Medicine. He received his degree from Harvard Medical School in 1934, interned at the Buffalo General Hospital, and has been on the medical faculty since that time. Before his promotion he was assistant professor of radiology at the medical school

Dr. Stafford L. Warren professor of radiology at the University of Rochester School of Medicine and Dentistry and during the war chief of the medical division for the entire atomic bomb project under the Manhattan District, has resigned to become dean and professor of biophysics of the new medical school of the University of California at Los Angeles

A member of the University of Rochester Medical School Faculty for twenty-one years, Dr. Warren began his new duties on February 1. He will supervise plans for the medical school buildings and university hospital of 500 beds to be built on UCLA's Westwood Campus, and assemble a faculty and staff for the new institution.

Dr L. L. Forehheimer, of New York City who served from 1942 to 1948 in the Medical Corps of the Army in this country as well as the European Theater returned with the rank of major and has resumed his practice of ophthalmology

Dr Richard H. Lyons, medical research scientist, has been named to head the department of medicine at Syracuse University's College of Medicine. Associate professor of medicine at the University of Michigan, Dr Lyons will begin duties in June in the first step of a planned reorganization of the clinical medicine branch of the University

After gaining his medical degree at the University of Michigan School of Medicine, in 1935 Dr Lyons went to Harvard University for several years as instructor He later became medical director of Eloise Hospital Detroit, Michigan a post he held three years. In 1941 he returned to the University of Michigan to accept a position on the School of Medicine faculty

Dr William Vilardo has returned to his home in Ticonderoga where he will begin the practice of medicine and surgery

A graduate of the University of Verment, College of Medicine, in 1940, Dr Vilardo interned at St. Michaels Hospital, Newark, New Jersey and the Margaret Hague Maternity Hospital, Jersey City New Jersey He was a medical officer in the U.S Army from September, 1941 to September 1945 serving as a bettalion surgeon throughout the European campaign. Since his release from the Army, Dr Vilardo has completed a residency in surgery at St. Francis Haspital, New York City, and a postgraduate course in obstetries at the Margaret Hague Maternity Hospital.

Dr James L Lanzillo of Troy, has been appointed a deputy county commissioner of health in charge of mental cases.

Dr Iansillo is a veteran of World War II, serving overseas for more than thirty months

The physician served in the Army Medical Corps for more than three years, receiving a commission as major *

Dr Fred T Cavanaugh, of Troy, has been elected physician in charge of the Arthur Wight Benson child walfare clinic of the Day Home in Troy

He succeeds the late Dr. Benson for whom the clinic was named, and who had been physician in charge since his founding of the work at the Day Home.

Dr Cavanaugh has given his services to the child clinic for the last thirteen years.

His staff of nine volunteers consists of Dr William T Shields, Dr C. E. Davis, Dr A. A. Lequidare, Dr Walter Schwebel Dr Hilde Siering, Dr Maurice K. Grupe, Dr Irwin Johnston Dr Alan Totty Dr W I. Walsh, and Dr Samuel J Werlin.

Announcement has been made of the opening of a medical practice by Dr Charles Rosen, at Chatham Dr Rosen succeeds Dr J D Hexton who has re-

tired from practice to his home in Decorah, Iowa. Dr. Rosen is a graduate of McGill University, Toronto Canada, and did his post-graduate work at that institution. He later practiced in Schoharle. A veteran of World War II, he was commissioned a captain in the Medical Corps and served as assistant chef of Medical Service, at Tripler General Hospital Honolulu.

^{*} Asterisk indicates that Item is from a local newspaper

Dr Eleanor Kellogg Peck, of Poughkeepsie, who was associated with the late Dr Alice Stone Woolley, has reopened her office for the general practice of medicine and pediatrics

Dr Peck recently completed a three months' course of study in postgraduate work in diseases of children at the University of Chicago clinics

A veteran of World War II, Dr Peck returned to Poughkeepsie about a year ago after four years service in the European war theater Dr Peck was engaged for two years at the Hospital for Sick Children, Great Ormand Street, London She was one of 11 women physicians chosen by the American Red Cross for the "Doctors of Britain" program A captain in the Medical Corps, she served with the Eighth Air force in England, France, and Germany

Dr Peck was graduated from Wellesley College and the College of Physicians and Surgeons, Columbia University and interned for two years at Bellevue Hospital, New York.*

Dr Robert D Kelsey, having been discharged from service in the United States Army where he served for two years, will engage in the practice of

medicine in Franklinville

Dr Kelsey was graduated from the University of uffalo in 1943 He spent the following year as an Buffalo in 1943 intern at the Jersey City Medical Center followed by obstetric training at the Margaret Hague Maternity Hospital in Jersey City Dr Kelsey's military career consisted of service with the Army, which he entered as a first lieutenant in the Medical Corps, where he saw service both in this country and the Pacific Islands. During his service, he spent considerable time in Air Corps hospitals and was promoted to captain after eleven months of service *

Dr Otto Pfaff, dean of Oneida physicians, marked

his eighty-third birthday on January 9
On March 10, Dr Pfaff will observe his fifty-

ninth anniversary as a practicing physician
Forty-five years ago he assisted in formation of Madison County Tuberculosis Society and later helped to found Madison County Laboratory, now located in Oneida City Hospital

Dr Pfaff practiced in Turin, Lewis County, for two years and moved to Oneida in 1902

born at Naumberg, near Croghan *

Dr Gilbert G Lehv, a veteran of several years service in the Army Medical Corps, has opened an

office in Poughkeepsie.

While in the Army, Dr Lehv was awarded the mentorious service unit plaque, the American theater medal, and the World War II victory medal He formerly practiced in Nova Scotia.

He was a member of the staff of the Victoria General Children's Hospital, Grace Maternity

Hospital, and the Halifax Infirmary

Eighteen Syracuse physicians were awarded certificates of appreciation by the US Army on January 8 at a luncheon at the Veterans of All Wars Club

The certificates were presented the civilian medical men for "sacrificing private practice during the national emergency" to aid Selective Service through

"loyal and faithful service"

The physicians worked with the US Army induction team at the Armory before and during the war in examining inductees to determine physical and mental qualifications leading to acceptance in the military services

Physicians honored were Dr Jerome E Alderman, Dr Sidney W Bisgrove, Dr Aaron Burman, Dr Leon A. Chadwick, Dr Noble R. Chambers, Dr Neal J Conan, Dr Raymond E Fenner, Dr Arthur Fleiss, Dr H Ernest Gak, Dr Frank B Glasser, Dr F Ross Haviland, Dr Harold G Kline, Dr Ambrose T Lawless, Dr Gregory D Mahar, Dr Dwight V Needham, Dr Albert B Siewers, and Dr William E Truex *

Dr Charles G Huntington, of Rye, former White Plains resident, is now associated with Dr Roy D Duckworth in the practice of radiology in the Medical Center

Dr Huntington studied at Columbia University and the New York University, College of Medicine He interned for six months at St. Agnes Hospital, then started a residency in radiology at Lenox Hill Hospital, New York City

Dr Huntington entered the Army in 1942 and after thirty-five months in Europe he was separated last January with the rank of captain and returned to Lenox Hill to complete his residency *

Dr John Settineri, recently discharged from the armed forces, has opened a practice in Jamesville, and is serving the Fabius-Pompey area Dr Set-tineri is a native of Seneca Falls

Another veteran, Dr N M Paul, is also serving residents of the Fabius-Pompey area where a shortage of medical facilities has existed Dr Paul 18 also an anesthetist at the Crouse-Irving Hospital *

Cortland County

Officers of the Cortland County Medical Society recently elected for the 1947 term are as follows president, Dr Fred A. Jordan, of Cortland, vice-[Continued on page 516]

to combat

depression characterized by

"chronic fatigue"

Depressed patients 'suffering from psychomotor inhibition complain of feeling tired of not being able to get started on their daily tasks, and of an abnormal inclination to procrastinate. They make up their minds that they are going to do a certain thing but they never seem to get to it. Everything seems too big for them

In the above quotation Kamman emphasizes chronic fatigue as a dominant symptom in the type of depression most frequently en countered in daily practice.

Benzedrine Sulfate is particularly valuable in the presence of "chronic fatigue. It will, in most cases help to overcome the depression and thus enable the patient to make a sincere and constructive effort to surmount his difficulties.

George Walter, M D, 67, of Bronxville, died on June 11, 1946 He was graduated from the University of Maryland Medical School in 1910

NO ALKALI REQUIRED

when you prescribe SALYSAL In massive salicylate therapy

Although ordinary salicylares require concomitant administration of sodium bicarbonate to relieve nausea and vomiting, a recent report¹ of an investigation states "we have observed beyond reasonable doubt that the administration of

sodium bicarbonate will promptly and materially reduce the plasma salicylate level and that the simultaneous administration of the two drugs will prevent the attaining of a satisfactory high level."

But Salyial causing no gastrointestinal intolerance needs no belp! It avoids any direct action on the gastric mucosa, for the salicyl radicals of the ester are so bound as to be liberated only in the intestine. In addition, Salyial is twice as active therapeutically as sodium salicylate. Each 5 grain tablet is equivalent in therapeutic effect to approximately 10 grains of sodium salicylate.

Salysal is clearly the drug of choice in the sallcylate treatment of rheumatic fever acute and chronic articular rheumatism, grippe, neuralgia, pharyngitis, tonsillitis and allied conditions. Salysal is indicated wherever sallcylates are beneficial, and where an analgesic and antipyretic action is desired

HOSPITAL NEWS

New York City to Have Increased Cancer Facilities

WITH the ground-breaking ceremonies that were held on January 24 for the construction of the 300-bed James Ewing Memorial Hospital, First Avenue, from 67th to 68th Streets, Manhattan, New York City has begun a program which at its completion will increase greatly the facilities avail-

able to cancer patients

James Ewing Memorial Hospital, to be part of the Memorial Cancer Center, will be operated and maintained by the City Its purpose will be the care and treatment of long-term cancer patients, and research in the disease The Hospital was named as a memorial to the late Dr James Ewing, eminent physician and pathologist, on recommendation of Commissioner of Health Edward Bernecker, "because of Dr Ewing's long association with Memorial Hospital, his outstanding position in the field of can-cer, and his many contributions to the various hospitals of our Department"

On the same day on which the ground was broken for the Ewing Memorial Hospital, the National Cancer Foundation began its program to make available adequate hospital care for the nation's advanced cancer patients. In New York City the Foundation is maintaining a unit of 125 beds at Manhattan General Hospital, 307 Second Avenue The beds will be available regardless of the patient's economic status, with the cost for those unable to pay cared for by the National Foundation Application for admission can be made through the patient's physicians, through accredited social service agencies, or by direct application to the medical Social Service Division of the Foundation at 85 Franklin Street The only requirement for admission to the Hospital will be that there are no other hospital facilities available to care for the person requesting admission

Clinics for the detection and prevention of cancer ere also opened in January Lenox Hill Hospital, were also opened in January Park Avenue and 76th Street, and Harlem Hospital. Lenox Avenue and 136th Street, have an evening clinic for those unable to leave their work during daytime hours Opened on January 6, the Lenov Hill Clinic is the first of ten to be opened throughout the city within the next few months Evaminations are by appointment and begin at 7 00 P vi

Harlem Hospital's clinic is open every Thursday night at 7 00 PM All applicants will continue to register through the Little Red Door of the New York Cancer Committee

Newsy Notes

"The Minimal Lesion in Pulmonary Tuberculosis" was the subject of the 37th Clinical Session on Chronic Pulmonary Diseases of the Tuberculosis Sanatorium Conference of Metropolitan New York held on Feburary 19 at the Cornell University Medi-cal College Amphitheatre, Manhattan The speakers were Dr Herman E Hilleboe, assist-

ant surgeon general, associate chief, Bureau of State Services, U S Public Health Service, Dr William H Roper, director, Research Section, Fitzsimmons General Hospital, Denver, Colorado, and Dr I D Bobrowitz, medical superintendent, Municipal Sanatorium, Otisville, New York

The March meeting was devoted to a presentation of the constitution and bylaws which had been prepared by the executive board. The speaker at this meeting was Mrs Gerald Cooney, State legislative

chairman

THE HIGHROAD OF THE FUTURE

It seems a shocking thing to say that the atomic bomb in the guardianship of the United States is the main safeguard of humanity against a third world

In the twentieth century of the Christian era, with all the march of science and the spread of knowledge, with all the hideous experiences through which we have passed, can it be that only this dread supersanction stands between us and further measureless misery and slaughter!

The atomic bomb is the new balancing factor Everyone knows it will not be used except in selfdefense against mortal injury and provocation No one can be sure whether it is a final and decisive

method of war Air power, however manifested and armed, may decide a war, but alone it cannot hold a front on land Still, of all the deterrents against war now acting upon the minds of men nothing is comparable to this frightful agency of indiscriminate destruction.

While this supreme weapon rests in the hands of the United States alone, it is probable, though we cannot say it is certain, that a breathing space will be accorded to the world We cannot tell how long this breathing space will last Let us make sure that it is not cast away —Collier's Magazine, "The Highroad of the Future," by Winston Churchill, p 64, January 4, 1947

Phosphoric Acid 12.3 grs. Calcium Phosphate, Monobe Calcium Girceronboschete 14.4 gra.

ORGANIC PREPARATIONS CO, INC. BROOKLYN NEW YORK

You know the importance of the psychological effect of tasty food!

When the patient is recovering from an illness, what can raise the spirits or help to speed the convalescence more than foods that look and taste delicious?

That's why Knox Gelatine is such a joy It's so easy to make tempting dishes that tempt even a flagging appetite So many different recipes to choose from so many of them made with real fruits or real vegetables, flavored with their good,

natural juices Patients are able not only to enjoy the fresh flavors but to benefit by the natural vitamins

Knox Gelatine, unlike flavored gelatine powders which are % sugar, artificially flavored and acidified, is all protein, contains no sugar

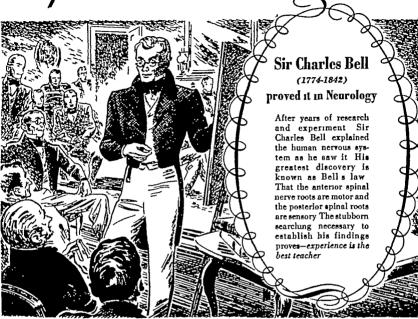

FOR FREE BOOKLET, "Feeding the Patient," write to Knox Gelatine, Dept 474, Johnstown, N Y

KNOX GELATINE

ALL PROTEIN, NO SUGAR

Yes, and experience is the best teacher in smoking too!

he wartime eigarette shortage is only a memory now but that s when millions of people—smoking any brand they could get—learned the differences in eigarette quality

And significantly more people are smoking Camels than ever before in history. But no matter how great the demand

Camel quality is not to be tampered with Only choice tobaccos properly assed and blended in the time-honored Camel way, are used in Camels

According to a recent Nationwide survey

More Doctors smoke **Camels**

than any other cigarette

The phrase "back to normal" accurately describes the action of the Floraquin regimen in the treatment of Trichomonas vaginalis vaginitis and the various other types of vaginitis with or without leukorrhea

Floraquin is perticularly efficacious in destroying not only the trichomonads but other pathogenic organisms present as well as restoring the infected vagina to normal acidity and flora. It alds in replenishing the normal glycogen content of the cells of the vaginal mucosa and permits the renewal of the normal thickness of the vaginal epithelium.

FLORAQUIN—a product of Searle Research—contains the protozoacide Diodoguin, combined with lactose dextrose and boric acid

FLORAQUIN POWDER—for office insufflation; 1 oz. and 8 oz. bottles.

FLORAQUIN TABLETS—for home use; boxes of 24

Recognitional Diodogues - the regist red trademarks I G D Searle & Co. Chicago 80, Illinois.

FOR ACCURATE DOSAGE BY WEIGHT

CHINE. always constant

DIGITOXIN Steams—the chief active constituent of Digitalis purpurea—is a pure microcrystalline compound with definite physico-chemical properties. Uniform in composition, it is standardized by weight-permitting the prescription of precise dasages-obviating the confusion of frog" or "car" units.

Administered orally Digitaxin Steams is approximately one thousand times as potent weight for weight as Digitalis U.S.P., 1 mg, of Digitaxin produces the same affect in man as I Gm. of digitalis.

MEDIADIVA rapid and complete

DIGITOXIN Steams is rapidly-and presumably completely-absorbed from the oral administration of the dose required is equally as gastra-intestinal tract offective as intravenous.

excellent

TOTOTA

MOGATORE-

DIGITOXIN Steams is free of inert therapeutically undesirable materials. Small doses produce full cardioc effects with virtual freedom from nausea and vomiting Single dose therapy for full digitalization is clinically practicable.

DIGITOXIN Steams—pure crystalline glycoside of Digitalis purpurea—is indicated in general in the treatment of those conditions which respond to digitalis leaf or other drugs of the digitalis group both for rapid digitalization and for maintenance.

Tablets of 0.1 mg and 0.2 mg bottles of 100 and 250; also available in viols of 25 tablets, six vials per corton.

Descriptive literature and a trial supply available on request

HUMBER OF A SERVICE HONORING THE CONTRIBUTIONS

DEFINITIONS

DEFINITIO

JOHN SHAW BILLINGS, 1838-1913

Proneer of American Medical Libraries

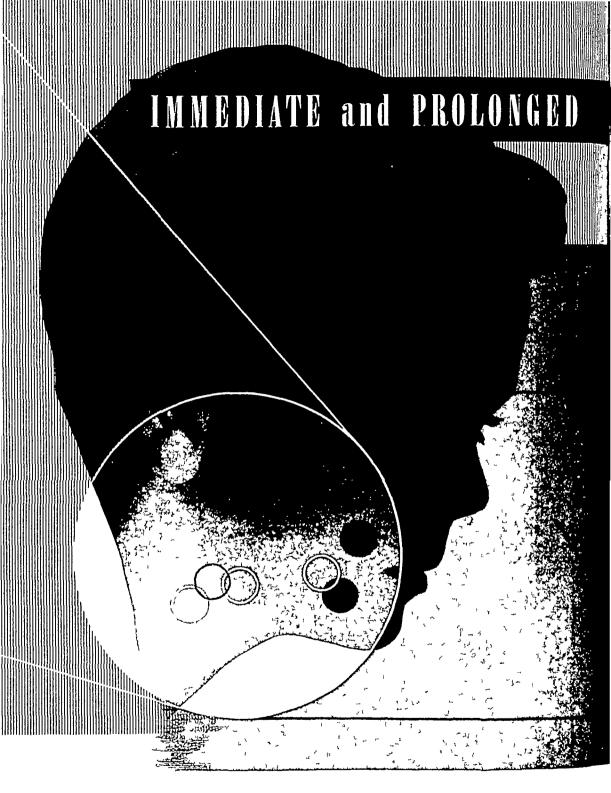

OF INESTIMABLE value in the raising of standards in medical education in America was the work of John Shaw Billings, principal founder and builder of the Surgeon General's Library in Waslungton D. C. As a key to this vast medical literature storehouse Billings

developed the great medical Index-Catalogue the most exhaustive piece of medical bibliography ever under taken. He was also the father of medical and vital statistics in the United States and originated the plans for the Johns Hopkins Hospital in Baltimore.

The facilities and effort of the Harrower Laboratory Inc are pledged to service of the allied professions of medicine and pharmacy and the best interests of public health

Hairowee LABORATORY INC + GLENDALE, GATTIORYIA

A PRODUCT OF

A Communication LABORATORIES, Inc. Pharmaceutical Manufacturers, Newark 7, N J

TOPICAL CHEMOTHERAPY in oropharyngeal infections

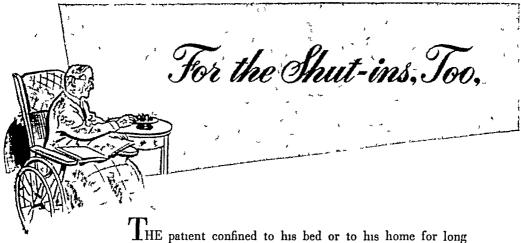

Its chinical value in the topical treatment of oropharyngeal infections has been established by longer professional use than any other local chemotherapeutic or antibiotic agent Each tablet contains 3% grs (0.25 Gm) of sulfathiazole. Supplied in packages of 24 tablets, sanitaped, in slip-sleeve prescription boxes

IMPORT INT: I lease note that your patient requires your prescription to obtain this product from the pharmacist

periods often presents more than a medical problem. Sense of well being is difficult to achieve or maintain under such circumstances, yet is of high therapeutic importance Anorexia, engendered by inactivity, makes adequate nutrition in many such instances a serious problem

For such patients candies offer a particular value Their taste appeal is universal, even in the presence of anorexia. They prove tempting at every age, for the child as well as during advanced years. They present little difficulty in digestion

Nutritionally, the candies in the manufacture of which milk, butter, eggs, etc are used, contribute more than their contained calories Though the amount contributed of each of these nutrients may be small, candies nevertheless aid in satisfying the need for biologically adequate pro tein, fat high in the unsaturated fatty acids, B vitamins, and minerals

THE NUTRITIONAL PLATFORM OF CANDY

- 1. Candles in general supply high coloric value
- 2. Sugar supplied by candy requires little digesin small bulk tive-effort to yield available energy
- 3. Those candles, in the manufacture of which milk, butter, eggs, fruits, nots, or peanots are
- (a) provide biologically adequate proteins used, to this extent alsoand fats rich in the unsaturated faity gads;
 - (b) present appreciable amounts of the import tant minerals calcium, phosphorus, and tron;
 - (c) contribute the niadn, and the small amounts of thiamine and riboflavin, contained in these ingredients
- 4. Candies are of high satiety value; eaten after meals, they contribute to the sense of salisfaction and well being a meal should bring; eaten in moderation between meals, they staye off hunger 5. Candy is more than a more source of nutri
- ment-it is a marale builder, a contribution to the joy of living
- 6 Candy is unique among all foods in that it shows relatively less tendency to undergo spoil age, chemical or bacterial

Wherever a general analgesic sedative is indicated,

appinoeal

offers three important drugs for their synergistic pharmacologic effect—the potentiation of analgesia

Formula
Tablet Aspirocal

Each Tablet Aspirocal
Comp. contains:
Aretylaslicylle Acid 4 gr
Calcium Checonate 2 gr
Buileol (6-ethyl-5-secondary
Instyl has biturio acid
McNell") 5 gr

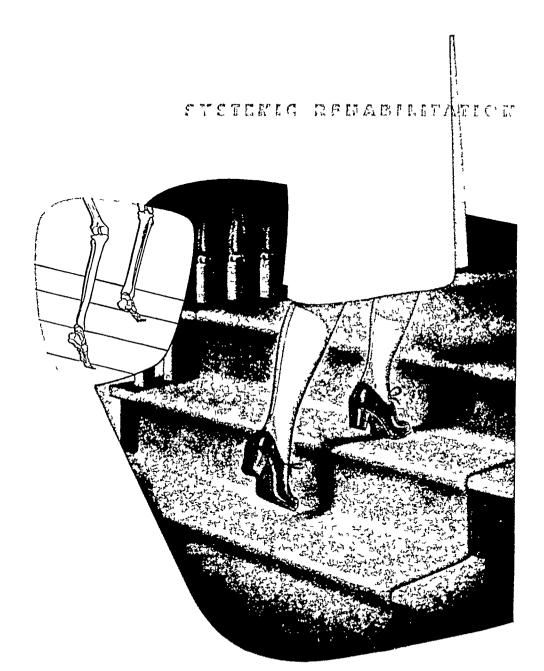

500 and 1000 tables.

*Books of Theraty Chicago, American

Aspirocal—although designed for general analgesic and sedative use—requires your prescription. Thus the patient is kept under your absolute supervision and the causation of pain can be checked. Aspirocal is widely used in headache, the large field of neuralgias and similar conditions rheumatic and arthritic conditions, and in dysinenorrhes and minor surgical procedures. Caution. Use only as directed. A trial supply well be sent to physicians upon request.

LABORATORIES, INC PHILADELPHIA 32, PENNA

DARTHRONOL

For the Arthritic

Even in advanced stages of chronic arthritis, adequate systemic therapy, combined with optimal nutrition and such adjuvant measures as physiotherapy and orthopedic appliances, can do much to abolish pain and restore useful function

The combined pharmacodynamic and nutri

Tretentes e

tional actions of its nine consutu ents make Dar thronol an im

portant integral part of any complete program of systemic rehabilitation of the arthritic.

RICIDAL NON

LOGRAPHY

Clinical studies concerned with the use of Glycerite of Hydrogen Peroxide in the treatment of chronic purulent otitis media demonstrated seventeen of twenty nine patients in complete remission in 14 days and the remainder by the 38th day. The patients studied presented conditions existent for periods of 2 weeks to over 40 years. Previous treatment by the usual therapeutic means, including tyrothricin or penicillin, was ineffective in all cases.

Available on prescription in one-ounce bottle with dropper Administration. One half dropperful two to four times daily

Your Job-And Ours:

To Build Baby's Weight

We're glad to share a little of that responsibility, and proud of our record in helping babies to a fine start in life with Nestlé's Evaporated Milk We're also glad to promise that you'll always be able to place full confidence in Nestlé's

NEZTLÉ'S

NESTLE'S MILK PRODUCTS, INC. New York, U S A

Nestlé's Has the "Know-How" to Produce a Good Product

- For 75 years, Nestlé's milk products have been best known, most used for babies 'round the world
- Nestlé's was the first evaporated milk fortified with 400 USP units of genuine Vitamin D₃ per pint
- Nestlé's accepts milk only from carefully inspected herds. As further assurance of quality, rigid controls check Nestlé's Milk every step of the way. We even take the plant apart every day and wash it!

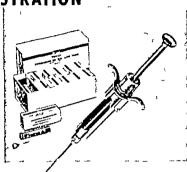

No wonder so many doctors commend NEXTLE's Milk by name

PENICILLIN ADMINISTRATION

is safe, simple, and fast with TUBEX®

Before unjecting aspirate to insure that needle is not in a blood ressel

- Designed for immediate injection no transfer from ampul to syringe.
- Administration is rapid—300 000 units injected in less than 30 seconds
- Tubex has a special safety feature—by aspirating it is easy to make certain that a blood vessel has not been entered
- Positive plunger of the syringe eliminates awkward administration

Prolonged therapeutic blood levels (12 to 24 hours) have frequently been observed after a single injection of 300 000 units. Nearly all cases of acute gonor rhea are cleared up by a single injection. Other susceptible coccal infections respond to one or two injections per day.

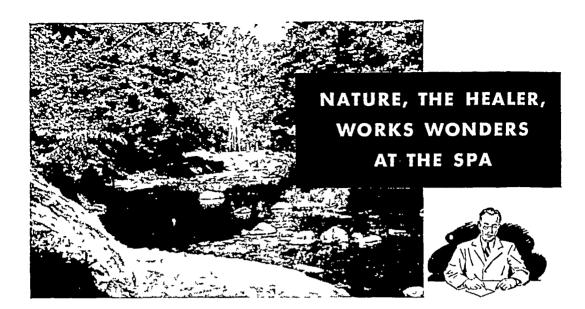

Available in 1 ce Tubex 800 000 units of penicillin calcium with Tubex needle (20 gauge 1½ inch). The Tubex syringe is supplied separately.

Tubex syringes and needles developed and produced by J. Bishop & Co are used exclusively by Wieth Incorporated

TUBEX PENICILLIN
in OIL and WAX

The superb man made facilities at the Saratoga Spa are placed in a setting of great natural beauty In this serene environment a sick person is ideally prepared for the full benefit of medical care

Here your patient is relaxed in both mind and body, so that the thera peutic values of the Spa's naturally carbonated mineral waters are enabled to exert their maximum efficacy

Your patient suffering from such conditions as cardiac, vascular or

rheumatic disorders receives the benefit of the Spa's restorative powers under a regimen of treatment which you yourself recommend

Well trained physicians are available in Saratoga Springs for consultation with your patient on the details of the program

With your patient at the Spa, you find needed relief from postwar strain in the knowledge that your directions for his continuing care will be faithfully carried out

"PHYSICIAN, GIVE HEED TO THINE OWN HEALTH"

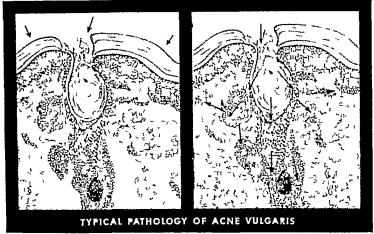

Many physicians have recently come to the Spa for the same kind of treat ments that helped their patients here After a restorative "cure" at the Spa, you, too, would return to your practice refreshed—revitalized—ready for the busy days that still he ahead

Listed by the Committee on American Health Resorts of the American Medical Association

Yellow color shows the usual penetration of oint ments and other topical medications.

Introderm Sulfur in new akin penetrant vehicle saturates the entire pathological area in and around the follicle. The deepest lesions are im pregnated with effective concentrations. This is why intraderm Sulfur often is successful even in stubborn cases.

Why Intraderm Sulfur is So Effective in Acne Vulgaris

To heal stubborn acne vulgaris cases use Intraderm Sulfur Solution as an adjunct.

The illustrations above tell why Intraderm Sulfur is so effective. It deposits highly active sulfur in acno lesions, down in the follicles and sebaceous glands

This treatment combines the new principle of skin penetration with the well-established effective action of sulfur in acne.

Extensive clinical studies' have proved the efficacy and safety of Intraderm Sulfur

Intraderm Sulfur Solution consists of 0.75% poly sulfides in a fundamentally new skin penetrating schicle designed to allow preferential action of sulfur at the sites involved in acne vulgaris.

MacKee Wachtel, Karp and Herrmann, Jour Invest Dermat 6 309 (1945)

Wallace Laboratories, Inc., New Brunswick, N.J.

Joint action of the chemical and physical proper ties of Intraderm Sulfur produces these results

Increased hyperemia, enhancing the natural de fense mechanisms.

Keratolytic action stimulating surface desquama tion and softening keratin blockage in the follicles.

The solvent action of the vehicle softens the foreign matter (dirt and oxidized sebum) in the follicle, while the effective wetting agents aid in its removal.

Intraderm Sulfur is well tolerated and easy to use.

Incorporate Sulfur (as sulfides and polysulfides) 0 8% triethonoloanies 100% sodium mised alkyl benzene sulfonate, 11.0% antipyrine 11.0% propylene glycol water

Honor To Whom Honor Is Due

Member physicians of the Medical Society of the State of New York who have practiced for fifty years or more will be honored at the Society's annual meeting in Buffalo, May 5 to 9, according to a resolution carried by the Council at its meeting of February 13

The resolution reads "Resolved, That the Medical Society of the State of New York at its next annual meeting bestow upon each member of the Society who has practiced medicine for fifty years or more a suitable certificate, to be signed by the President of the Society and attested by the Secretary in recognition of the service performed by each of these physicians for the benefit of the people of the State, and that the official

presentation of these certificates be made with appropriate ceremonies."

Since the passage of this resolution, the Society has been assembling lists which include the names of these practitioners, their addresses, telephone numbers, dates of medical school graduation, names of the schools, and pertinent biographic information to be used in stories for release to the press

Any additional information in this last category which readers of the JOURNAL feel might not have come to the attention of the Society would be welcome and may be mailed to Mr Dwight Anderson, Executive Secretary, Medical Society of the State of New York, 292 Madison Avenue, New York 17

The Kenny Treatment

We have long held the theory that for the average person the secret of success was to have no sense of humor and just one idea. The brain should be capable of embracing that idea and nothing more. Versatility is a terrible handicap because it leads you to wonder about the relative importance of

things. Einstein, for example, would doubtless have evolved his formula of relativity years earlier had he not been subjected to the distractions of his violin. The most superb example that supports our theory is Sister Kenny

Before proceeding further, we wish to

inform our readers that we have subjected ourself to grave personal risk on their behalf Always the conscientious reporter, we have attended both Sister Kenny's personal film and the more splendid and ambitious commercial production that features the beguling Miss Rosalind Russell, well though we knew what the two experiences would do to our blood pressure. We have read a great deal of literature on the subject. For our readers seriously interested in its scientific aspects we recommend an article by Dr. A Bruce Gill, recently president of the American Orthopedic Association.

We think it most important that every doctor, particularly the general practitioner, should have a clear picture in his mind of what the Kenny treatment is and isn't

A lay person seeing the film lately upon Broadway would come away with the conviction that doctors—while a great tribute is paid them as unselfish toilers in the cause of suffering humanity—were more than slightly dumb and fiercely resistant to any new idea, particularly when coming from a lay person

They would believe that the Kenny treatment would cure 80 per cent of the victims of anterior poliomyelitis. They would regard plaster of paris and braces as the most hideous instruments of torture to be devised since the Inquisition, Dachau, or Buchenwald.

Sister Kenny and her sycophants have reversed the field in the subject of pathology. The cinema stresses this point repeatedly. The sick muscles are the well muscles and vice versa. The flaccid, paralyzed muscles are the normal ones and those that maintain their normal tone and contract at the expense of the paralyzed, thereby causing deformities, are the sick ones. There is no point in bothering the public about pathology. We pass this over as relatively unimportant.

Anterior poliomyelitis is one of the most mysterious diseases in the world. In the course of thirty years' experience we have seen patients initially paralyzed from the neck down recover completely

We have seen cases afflicted with paralysis

of but a single muscle make no improvement whatever

We have no objection to the Kenny treatment provided it is not given until the first stage of the disease—which is the acute inflammation of the central nervous system—has subsided

We object passionately to the impression given to the public that if you have a child stricken with the dread disease and do not furnish him the Kenny treatment you are selfishly condemning him to a lifetime as a cripple

In the epidemic of 1916, in communities where no treatment was available many cases were put in plaster, their pain relieved and their deformities prevented Many cases so treated made complete recoveries Others did not

If a child of ours had the disease we should be glad to have him have the Kenny treatment provided it was available and its cost was not prohibitive. The patient is the subject of constant attention instead of being put in plaster and left to nature. Conversely, we should be equally sanguine of his recovery under the more conservative forms of treatment long advocated by orthopedic surgeons.

They recognize that the disease is one of the anterior horn cells of the spinal cord and that during the period over which those cells may reasonably be expected to recover, the essentials of treatment are rest and the prevention of deformity

We have presented our views as briefly But we leave this and clearly as we can question to our readers Isn't Sister Kenny a perfect supporter of the theory propounded in our opening paragraph? Start with a background of complete ignorance of your subject-your press agent will call this "open mindedness"—stumble upon something that doesn't do much harm and that sometimes seems to do much good, be completely free of a sense of humor and of any sense of comparative values and end up with the Hearst papers backing your appeal for a \$2,000,000 fund Big business

¹ Gill, A. B Journal of Bone and Joint Surg 26 87 (Jan.)

We Acknowledge a Debt

Dr Lee deForest, now 73 years old, was one of the men who fathered modern radio. This is not to minimize the pioneer work of Signor Marconi, or Dr Fleming, whose valve Dr deForest improved by the addition of a third element. Dr deForest's contribution of forty years ago to the science of communications, which made possible the later art of radio broadcasting and sound motion pictures, entitles him beyond question to make outery with a father's understandable solucitude.

What have you gentlemen done with my child? He was conceived as a potent instrumentality for culture, fine music, the uplifting of America's mass intelligence. You have debased this child, you have sent him out on the streets in rags of ragtime tatters of jive and boogie woogie, to collect money from all and sundry for hubba and hubba and audio interbug

You have made him a laughing stock of intelligence, surely a stench in the nostrils of the gods of the ionosphere, you have cut time into time subelets, called shorts (more rightly stains) wherewith the occasional fine program is periodically smeared with impudent insistence to buy or

try

The nation has no soap, but soap opera without end or sense floods each household daily

Murder mysteries rule the waves by night and children are rendered psychopathic by your bed time stories.

This child of mine has been resolutely kept to the average intelligence of thirteen years. Its national intelligence is maintained moronic, as though you and your sponsors believe the majority of listeners have only moron minds. Nay, the curse of his commercials has grown consistently more cursed, year by year.

¹N Y Times, Jan. 21 1947

We are entirely sympathetic to Dr de-Forest's inquiry and mild, courteously restrained comments addressed to the National Association of Broadcasters Modern, scientific, socially conscious American medicine now has many technics, research facilities, and communications facilities for which doctors and their patients should be profoundly grateful to Dr deForest and his coworkers. We acknowledge the debt, unfortunately accepted too much as a matter of course and with heretofore faint expression of gratified.

For his query to the National Association of Broadcasters we are now still further in his debt. He did not specifically include, as he might have, the nauscating "labberwacky" of commercial invitations to selfmedication, the endless piddle-piddle of the proprietary pluggers, the husky honking of the hormone and vitamin hucksters, the pain killers, the headache hushers, the short courses in pseudoscience, intestinal pathology, gastric malfunction, the biochemistry of the belch, the lush lowdown on the liver. the crafty stalk by a vibrant voice (with or without gun and camera) into the land of the "hairyanus," for example, in pursuit of the humble hemorrhoid, or how to agitate a limp or lissom libido

We must, we suppose, take the good with the not-so-good on the ground that there may be a fly in any ointment, but at least the fly doesn't buzz, sing jingles, or audibly irritate the customers, however much its presence there at all reflects, shall we say, carelessness in final inspection? This is no fault of Dr deForest's, but evidence of juvenile delinquency in his offspring.

The Spirit of Revolt

Lest anyone entertain a doubt that the spirit of revolt still burns fiercely in the hearts of traditionally free men, we call to the recollection of our readers some recent instances. For long resentment has been accumulating in the peoples' minds against the mept, prying, dictatorial, and at times

seemingly pathologic passion for governmental control and regulation of the minutiae of the lives and habits of everyone. The begats of Adam are awakening to the realization that they do not like the idea

Housewives revolted against government control of meat which produced everything the heart could desire except meat Many persons became hot under the collar at the President's philosophy when he stated over the radio that government seizure of the industry had been seriously considered and rejected only because the cattle were distributed so widely That, presumably, made seizure impractical

On the state level, many administrators have for long resented Federal invasion of their rights, Federal invasion of their tax prerogatives. Federal threat to carefully planned, well-tried state services for the advancement of public health, education, welfare.

Locally, people are in general revolt against ideas and governmental practices of foreign importation as represented by the CIO-PAC, the ICC, and such Many people are in revolt against being labelled reactionaries because they still believe in fair play, individualism, a free economy, the secret ballot, the two-party system, all the things which they consider American

The medical profession is one with the people it serves. It has for years in this country protested efforts to impose from Washington a national system of foreign origin of state or governmentally controlled medical practice upon the people. Against such an approach to the eventual police state, it is in continuous revolt on behalf of the helpless sick.

Revolt by doctors stirs also in temporarily Socialist Great Britain, open, raw, stark, and menacing Revolt is not a new thing to the British From the time of King John and Magna Carta to the present day they have practically specialized in it. To us comes word via the Lancet of the final outbreak of a long smoldering rebellion. Reporting the revolt, the Lancet comments editorially in part.

The designer of the bedpan is presumably long dead. Two things, however, are certain he had never been a patient and had never met a nurse. His pan has one virtue—thanks to its flat bottom and inward-curving brim it does not easily upset in the bed—but as Dr. Douglas McClean points out (p. 834) everything else is wrong with it. It is too shallow to contain deodorant, the feeble, the elderly, and the surgical

case have to be helped on and off it at the cost of great physical exertion, the weak cannot balance on it, the constipated cannot bear down, the whole ward is offended by the smell, and the patient with a bulky stool endures the sensation described by soldiers as being "jacked off the pan" A not uncommon way to die is from cardiac syncope or pulmonary embolism while on the bedpan

These drawbacks alone should be enough to condemn it, but, in addition, a series of objectionable practices surrounds its cleansing rooms, in most British hospitals today, are small and primitive, and methods of washing pans offend against the hygiene standards not only of a hospital but even of the ordinary household What local authority would countenance lavatory pans which splashed the housewife with dilute feces? What woman who had later to handle food would care to dip her hands in fecally contaminated water? The junior nurse often has to accept both experiences In too many hospitals she brings the soiled pan, covered by a cloth, through the ward and inverts it over a sink fitted with a small spray or jet intended to flush it, the pan is thus rinsed in dilute feces, and the nurse receives her share of splashes

Here is spirited revolution breaking forth The bill of particulars continues

After a final rinsing, the pan is left inverted on the draining board—often a wooden one which cannot be properly cleaned or sterilised smell from the sink is permanent, the clatter of the pans can be heard in the ward, the nurse washes her hands hurriedly and goes off to the next job—to move or lift patients, to make beds, or cut bread-and-butter The bedpan is not sterilised before it is given out again, it is not reserved for any one patient, usually bedpans are too scarce to make this precaution possible Pans are "sterilised" once a day, in the morning, by rinsing in lysol and water, and if the sluiceroom is small, this rite may be carried out in the patients' bathroom Urine bottles are rinsed in a similar manner, and the dangers of such a haphazard practice in a general ward need not be detailed

In the United States, Canada, South Africa, and a few British hospitals the tipper system is in use. The nurse presses a pedal with her foot, a flap in the wall drops open, she puts the bedpan in, closes the flap, turns a handle, and the pan is flushed with water and sterilised with steam Some such system must of course become universal, but in the present state of the building industry, many years will pass before all our hospitals are so equipped. Short-term measures must be less revolutionary

^{1&}quot;Revolt from the Bedpan June 1 1946 p 820

RDITORIAL

The Anatomy Department at Oxford was successful in designing a chair for a ship's gunner directing fire at an approaching aircraft, here is an equally difficult but more universal problem which needs solving at once Besides being easy to clean, the pan should be easy to slip under the helpless patient and so shaped that he is comfortable and able to use the necessary muscles during defecation The pan could be lightly filmed with an appropriate deodorant.

Britons are apparently as determined as ever, never to be slaves—even to a bedpan Sic semper turannis!

Current Editorial Comment

Check and Double Check. One of the most successful publications of the Medical Society of the State of New York, apparently, is the booklet "Check and Double Check on Sickness Insurance" by Mr J Weston Walch This booklet is a project of the Public Relations Bureau and appears, according to the Christian Science Moni tor,1 as an answer "to President Truman's renewed recommendation of a national system of compulsory sickness insurance

" In a special article entitled "Medical Society Cites Defects of Europe Sickness Insurance," by one of its staff writers, the well-edited Monitor says further study cites European experience as evi dence that under sickness insurance, medical care often is inadequate and unsatisfactory, and that time lost through illness has shown an increase

Appreciation from many sources has begun to flow in Mr R A Hohaus, actuary of the Metropolitan Life says

Impressed by much of its contents indicated that the author must have had access to someone who had done a great deal of research and study in that field

The New Orleans Medical and Surgical Journal says

We are quite enthusiastic about this pamphlet, so much so that we are taking the liberty to suggest to the Executive Committee that at least one copy be sent to every doctor in the state

John W Neal, secretary of the Illinois State Medical Society

I should also like to be advised whether the material in the handbook may be reprinted or reproduced for the use of the members of this society and others

Dr Jose Santillan, of New York City

Please furnish me with a copy of your Check and Double Check' for my use when I return to my country, the Philippines, this year

Mr Walt Clyde, says

It may interest you to know that in the past month, five physicians called my attention to your booklet, "Check and Double Check." This was quite a surprise to me in view of the fact that my personal acquaintance is limited to less than one hundred physicians

it is my opinion that your work is the first completely organized presentation of the subject for two evident reasons first it is easy to-read and understandable to the laymen and, second, it is well indexed for quick

reference.

Mr Clement F Robinson, of Robinson, Richardson & Leddy, counsellors at law, Portland, Maine, says

I was on a committee of three appointed by the president of the American Bar Association some years ago to prepare and present a statement with reference to the Wagner-Murray Dingell Bill, and this pamphlet of yours goes far ahead of any of the data which was available at that time.

More gratifying, even, are the orders for California Medical Association wants 2,000 The American Medical Association, 1,000, Extension of Medical Service Foundation, Chicago, 1,000, Eli Lilly Company, 1,000, Virginia Medical Society. 500, Florida Hospital Service Corporation, 250, the Michigan and Ohio State Medical Societies, 300 each, Nebraska Medical Service, 200, Medical Society of the State of Pennsylvania, 100-to name but a few

In most of the high schools of the country this year the subject of sickness insurance is a topic for debate, and this pamphlet presenting, as it does, the case against compulsory sickness insurance briefed by a school teacher is timely and useful

Even before the mailing of 16,000 circu lars began advertising "Check and Double Check," orders had been taken for 3,750 copies, according to the report of the chairman of the Committee on Medical Pubherty to the Council of the Society in January 2

¹ January 22 1947 page 7

¹ Minutes of the Council Meeting of January 9 1947 p. 1

Excellent work of this kind, timely and well planned, deserves the highest praise It is one of the functions of a forward-looking and enterprising state medical society which redound to the credit of the duespaying membership who support it, not only with money but also with good leader-

Insulin Shock Treatment of Bronchial Asthma has been a problem since John Floyer described his own symptoms in a "treatise of the asthma" in 1698 Bostick in 1819 saw it as an "effluvium of new hay," and Blackley in 1865 showed the effects of pollen on the skin of hay fever pa-The real solution, however, of the problem of the relation of hay fever and asthma to dust, pollens, and other sources of allergens, began with the work of Dunbar in 1905, and of Wolff-Eisner in 1906 suggestions concerning helpful treatment of asthma, based on scientific experiments and controlled clinical observations, are always welcome

Wegierko in 1935 first used insulin shock in the treatment of bronchial asthma. In 1937 he reported good results, some permanent, others improved for periods of months

or years

Godlowski, accepting the explanation of physiologists, based on experimental demonstration that insulin shock causes an increase in the output of adrenalin, begar the use of shock treatment in those cases of bronchial asthma with an allergic etiology Not only does hyperinsulinism induce a defensive hyperadrenalism promptly to protect the body against the shock, but it has been shown that repeated small doses, or a single shock dose, of insulin may develop hypertrophy and hyperfunction of the suprarenal glands, making them permanently capable "explosive" liberation of mereased amounts of adrenalm in response to subsequent emergencies

The author recommends insulin shock treatment only for those cases of bronchial asthma with an allergic etiology. He excludes all cases of bronchial asthma due to causes other than allergic, all types of hypertension, acute and chronic circulatory failure, and patients with any degree of demonstrable impairment of carbohydrate metabolism. Patients tentatively selected for insulin shock treatment are first given a general physical examination. This is followed by (1) a careful personal and family

history to discover the allergic tendency, (2) electrocardiogram, chest x-ray, and repeated blood pressure readings, (3) blood count and blood film examination, B S R and glucose tolerance test, (4) sputum culture and examination for eosinophilia, (5) stool examination for parasites, and (6) ear, nose, and throat examination and necessary treatment

Insulin shock treatments were given three times a week in the early stages in some cases, but usually twice a week, the total number of treatments varying from six to thirteen. Routinely, two additional insulin shocks were given after the stage of clinical recovery. The duration of each shock treatment usually was three hours, terminating by self-recovery or by the use of a solution of

glucose

The temporary effects of insulin shock on patients with bronchial asthma are (1) hypoglycemia, varying from 18 to 36 mg per cent, (2) increased blood pressure (usually at the end of the first hour of insulin shock) of 15 to 70 mm of mercury, (3) relief of shortness of breath, (4) shock symptoms including palpitation, perspiration, excitement, tremor, convulsions, and unconsciousness. The blood pressure descends to its preshock level within two hours after the blood sugar is restored to normal

The permanent effects of insulin shock in responsive cases of bronchial asthma are (1) relief of symptoms of asthma, and (2) a fall in eosinophilia of ten to 60 per cent. Of the eight cases of allergic bronchial asthma treated, seven have remained clinically well for periods of eight months to two and one-half years. One of the eight cases relapsed in five months. This is the only allergic case in the series that showed no fall in eosinophilia.

For that reason, great importance is attached to eosinophilia (1) because it is regarded as a cardinal sign that the asthma has an allergic cause, and (2) for the further reason that a fall in eosinophilia is a valuable prognostic sign that the treatment is, or will be, beneficial The three cases of bronchial asthma not due to allergic causes, showed no benefit from treatment with insulin shock

The author believes that treatment with insulin shock achieves a large measure of success in cases of allergic bronchial asthma by reason of the increased output and utilization of adrenalin produced as a defensive reaction "against the toxic action of massive doses of insulin"

PULMONARY TUBERCULOSIS, EARLY AND DIFFERENTIAL DIAGNOSIS

R. J ERICKSON, MD, Albany, New York (From the Tuberculosis Service Albany Hospital)

IT IS now some forty-odd years since a con-certed public effort for the control of tuberculoss was started in this country Great ad vances in diagnosis, mainly by x ray, have been made, and facilities for treatment have been enormously increased. The education of the public as to the importance of early diagnosis has been so widespread that most of the population certainly has at some time heard talks received literature, or otherwise been made cognisant of the necessity for early diagnosis and treatment. The results would seem to have justified the effort The death rate in New York State has dropped from 217 to 44 per 100 000 or 80 per cent, since 1900 It is difficult to evalu ate all factors contributing to this decline natural decline in the disease, changing economic conditions, implation of infectious cases, and public education all may bear a part Has it been due to the fact that we have been finding more new cases, and making diagnosis at earlier stages of the disease? This is true only to a limited degree. For purpose of illustration, the accompanying chart (Fig 1) shows that in Upstate New York the drop in death rate of respira tory tuberculosus has been concomitant with the drop in new cases reported, until 1940 In other words, we were not making any great strides in finding new cases Since 1940 there has been a definite change in the trend. For the first time, since complete records have been kept, the num ber of deaths is slowly falling while the number of new cases reported is rising. It is unlikely that this is due to an actual increase of new cases. It is coincident with the initiation of mass x-raying in civil life, and is certainly due in part to the x-raying of men for induction into the armed forces. Not only have more cases of tuberculosis been reported in the last five years but there has been, as well, an absolute and relative increase in the number of minimal cases, especially in men I refer you to charts of a recent analysis by Mikol and Plunkett of cases reported in Upstate New York. (See Figs. 2 3 4, and 5)

The percentage of minimal cases in all reported cases of respiratory tuberculous in men, remained about 20 per cent from 1924 to 1939, since then it has risen to 38 per cent. In women

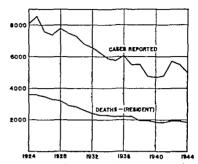

Fig. 1 Pulmonary Tuberculosis. Resident deaths and cases reported in Upstate New York 1924-1944 Deaths up to 1931 estimated from recorded deaths.

the percentage of minimal cases remained about 22 per cent from 1924 to 1936, since then it has men to 42 per cent These are encouraging signs It may be that at last the goal long worked forthe era of true early discovery of pulmonary tu berculosis is beginning. The next few years will tell whether this is so. The provisional figures for 1945, not here recorded, are not so favorable Experience has demonstrated that more early cases can be uncovered Future results will be proportional to our efforts fact still remains, moreover, that about a quarter of the cases of tuberculous in men and about a fifth in women are not now discovered until the disease is far advanced. How much this proportion can be reduced is still to be revealed These far advanced cases are apt to be in the lower social and economic groups hardest to reach in case finding. It is perhaps naive to expect other than a very gradual reduction in their number

Such progress as has been made has been due certainly in large part to the widespread use of x-ray in survey work. It has been amply demon strated that if we are to really find early tubercu losis, we must search for it, not only among con tacts of known cases but in the population at large. No botter demonstration of this fact can be found than in the results of selective service examinations.

Presented at the 140th Annual Meeting of the Medical Society of the State of New York, Section on Chest Diseases, May 2 1946.

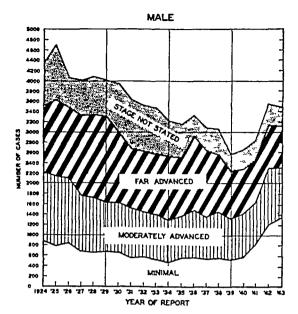

Fig 2 Number of reported cases of respiratory tuberculosis by sex and stage of disease, New York State, exclusive of New York City, 1924–1943 *

that radiographs were there taken in an apparently healthy young group which had previously been screened for obvious defects. Through the Albany Hospital Tuberculosis Service we have attempted to follow all Albany County inductees rejected because of abnormal chest films. Final follow-up and evaluation is not yet available in many cases but the following figures are presented as a fairly representative picture of what may be expected in the analysis of such a series of abnormal chest films.

Total number rejected—311	
Not included in analysis	
Previously known old cases	29
Under care, private physician (not re-	
ported active)	41
Followed-up outside county (4 reported	
active)	7
Moved out of country	12
Unable to contact (working and appar-	
ently well)	12
Refused examination or failed to keep	
appointment for examination	14
Unable to trace	13
There is coute mood reason to believe that	A 17

There is quite good reason to believe that except for the 4 active cases that went elsewhere for treatment, few of the remainder are active cases as most were rejected two to four years ago and have not as yet appeared on record as active cases

However, we include in this analysis only those cases which we have personally followed Total number included in study was 183

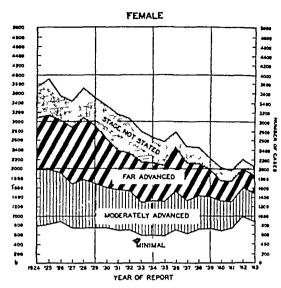

Fig 3 Number of reported cases of respiratory tuberculosis by sex and stage of disease, New York State, exclusive of New York City, 1924-1943 *

Analysis of All Cases

Thus, of the 183 new cases personally followed, 53, or 30 per cent, were evaluated as having clinically significant lesions. This is probably a

^{*}Mikol E K and Plunkett R. E , Am J Pub Health 35 1260 (Dec.) 1945

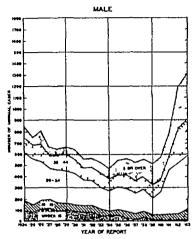

Fig. 4 Number of reported cases of minimal respiratory tuberculosis by sex and age, New York State exclusive of New York City 1924-1948.*

high figure for if we include in the total figures all cases who refused examination, those having their own physician and who are apparently well, and among active cases the 4 cases known to be treated elsewhere, we may estimate about 20 per cent as the number with clinically significant tuberculous lesions

Of the 50 patients whom we treated for active disease, less than one third gave any significant bustory of symptoms in the more distant past. In the very recent past, about 40 per cent complained of some cough 20 per cent of having sputum, 10 per cent of some chest pain 12 per cent of losing weight and one of hemophysis. On physical examination 35 per cent showed riles. Seventy-eight per cent on careful study had positive sputum.

Buch figures are nothing new, but emphasize again the fact that to find tuberculosis we must look for it by means of the v-ray. It is doubtful if any amount of education as to early symptoms will uncover more than a small percentage of these new, early cases for ever after the diagnosis is made a careful review of the history often fails to reveal symptoms definite enough to lead the individual to seek medical aid. If a person does not seek medical advice it is obvious that not much responsibility attaches to the physician in private practice. The matter iles outside the sphere of his activities. Once a patient appears in a physician s office however a great responsi

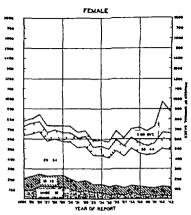

Fig 5 Number of reported cases of minimal respiratory tuberculosis by sex and ago, New York State, exclusive of New York City 1924-1943 *

bility falls upon this physician to see that proper diagnostic measures are carried out. Careful physical examination is quito inadequate. Any physician doing tuberculosis work can testify how frequently patients with symptoms, who have long received medical care, but have not had an x-ray film taken, come to the sanatorium. The false assurance given such patients has been worse for them than if they had received no medical attention at all

The very fact that the x ray is so necessary and so valuable necessitates a word of warning There is a tendency today to refer a suspect to a radiologist and to accept uncritically and as final the report received, and thus fall into serious We should not accept an x ray reading as a final diagnosis. It is simply one man's interpretation of certain densities The normal chest varies greatly in different individuals Unusually prominent markings may be wrongly interpreted as disease. Many different lesions at various stages cannot be differentiated from tuberculosis. The earliest manifestations may not be revealed in a film or be so slight that they may be passed over readily and noted only later on review as changes become more definite. Moreover there are certain blind areas behind ribs, near the mediastinum, and behind the heart which are not revealed even in the best films Speaking clinically there will always be a small group of patients with vague symptoms and nega tive x ray findings who will later develop active diennen Three of us who ere lame number

films taken of student nurses quite frequently face this problem

We should, in no way, disparage the radiologist's role in diagnosis, for he usually gives us more information than anyone else, but as we push our inquiries further and become more critical, we realize that in addition to such evidence as films may give us, we must examine some cases often and repeatedly We must, above all, not give false assurance to patients without such repeated observation One has but to spend a little time reviewing old films of patients entering a hospital to realize the gravity of putting the whole responsibility, especially of evaluating the activity of the lesion, on the interpretation Too often, because the radioloof the x-ray film gist thought the disease mactive and presumably because of lack of symptoms, these patients have been allowed to go on to advanced disease However skillful the radiologist may be, the sole responsibility should not be put on his shoulders

To diagnose the presence of infiltrate in a film usually is not difficult but to evaluate its significance is often not easy The less the infiltrate the harder it is to give intelligent advice This can be given only after adequate laboratory examinations are made The widespread use of the n-ray has caused a certain neglect of careful sputum studies Among the 51 selectees we hospitalized, only 20 per cent failed to show bacilli after careful examination Thus, careful sputum studies, without x-ray, could have revealed most of these cases Another warning is here necessary The term negative sputum without qualifying terms is not an adequate statement of the infectivity of the sputum For even reasonable certainty, a concentrate of several days sputum is a minimal requirement If negative on concentration, for real certainty we must await the result of culture and especially guineapig inoculation of not only the sputum but of fasting stomach contents For example, at the Albany Hospital in 100 guinea-pig inoculations, all positive, 47 were positive on culture, and only 19 were positive on smear of concentrate—or a 50 per cent gain of positives by animal inoculation

In 1942 in 100 similar cases, with inoculations all positive, 70 were positive on culture but only 24 positive on smear of concentrate. Thus, culture and animal inoculation was four times as effective as concentration tests. Moreover, one test is not adequate. If there is a question of the activity of the lesion several specimens of sputum should be studied.

This brings up two important and very practical problems in early diagnosis. What are we to do with these borderline cases during the interval when these time-consuming laboratory studies are being made? Secondly, does a positive cul-

ture or guinea-pig inoculation categorically indicate the necessity for active treatment? It is relatively simple for the sanatonium or clinic physician to tell the patient that there is a small amount of infiltrate in the lung and advise rest while x-ray findings are being observed and sputum studies being completed For the practicing physician the problem is quite different patient may have several dependents and cannot lightly interrupt his work. In the absence of symptoms it is not easy for the physician to insist that he stop work and rest under observation, until the final estimate is made I believe one can fairly allow such a person to continue at work provided one in the meantime keeps careful check of clinical manifestations and finally checks the x-ray findings In fact, it often happens that insisting on prompt radical treatment in these borderline cases may result in unnecessary hardship to the patient, and at times, loss of contact with the patient who needs treatment It is hard for the asymptomatic patient to realize that he may have a serious disease and he may wander off, hunting for a favorable opinion elsewhere Repeated interviews, without too much insistence on the physician's part, develops confidence and comprehension on the part of the patient that finally leads to a much firmer control of the situation

As to the second question, "Does the finding of acid-fast bacilli always mean active disease demanding treatment?" I think we must admit this is not invariably the case Probably in the recently discovered case we had best take no chances and institute treatment at once ever, certain cases of old fibrotic type unexpectedly may show a few acid-fast bacilli on culture or guinea-pig inoculation, especially after acute respiratory infections, and thereafter have repeatedly negative sputa. Discretion is necessary before labelling these as active cases, requiring strict treatment This has recently been demonstrated most disturbingly by Medlar who repeatedly checked the gastric contents of expatients, well and working for years, and found that in one third or more, virulent bacilli were occasionally eliminated

Thus, as in all phases of medicine, the refinement of laboratory procedure throws an added responsibility on the clinical judgment and acumen of the physician. The errors of omission in sputum studies, however, far outweigh those of too fine interpretation. A positive sputum is a serious finding except occasionally when there is a large backlog of observation.

There is no more common error in routine hospital practice than that of making a diagnosis of minimal inactive disease on the basis of an x-ray reading and one or two negative sputum reports,

and then to dismiss the patient, telling him nothing, or telling him unqualifiedly that his disease is mactive, and not urging repeated further checkins. There is considerable temptation to do this as the patient is temporarily much relieved and is apt to be very pleased with his physician's report. One can readily appreciate the patient's trititude. He feels secure, for he has had his vary, his sputum is negative, and he thinks he has the final answer and does not report for later check-up. The blame for occasional resulting catastrophy then rests squarely on the physician or the hospital service.

From the study of this group of rejectees it is obvious enough that early tuberculosis is asymptomatic and must be discovered by the x ray What concern, then, is it of the private physician? Except as a member of society and through public health agencies, he cannot hope to play a part in such large-scale x ray surveys. This, however, does not absolve the private physician of case-finding activities once he has assumed the care of a positive case. All agree that the most fruitful source of new cases is among the contacts of known cases It is here that the private physician has an incomparable opportunity, for it is he who usually first sees most patients, has the confidence of the family, and can most easily persuade contacts to be ex amined. A careful survey of contacts at times yields most startling results. I know of one family in which the mother had recently died of tuberculous and examination showed that five of the six children had tuberculosis. I have seen three generations of tuberculous individuals all living together in the same house. In one instance, the death of a three-month-old child failed to reveal any infection of the parents or siblings. Further investigation revealed boarder with far-advanced tuberculous succeeding investigation led to the examination of 36 persons Histories of this group revealed that in the past three generations there had been ten deaths from tuberculosis. Later developments resulted in two more adult deaths two deaths in children, and the discovery of four severe childhood infections including pleurisy with effusion, two moderately severe childhood infec tions, and ten other positive tuberculin tests in children I am sure many present who are doing tuberculosis work have had similar startling ex periencos

One cannot discuss early diagnosis without some discussion of the tuberculin test. We know that there are many fluctuations in the sensitivity of the individual to tuberculin and that the test may become negative after having been positive to ordinary doses. Thus, this test cannot be accepted as conclusive proof that m-

fection has never occurred We can, however, accept as a fact that tuberculosis of clinical significance rarely exists in the face of a negative tuberculin test. Thus, in obscure adult chest disease a positive test is of little help while a negative reaction quite conclusively rules out tuberculosis. On the other hand, a positive reaction in children is highly significant. The younger the child, the more important it is and the more it indicates a family source of infection Using a tuberculin test widely leads to difficulties in certain apprehensive families. One occasionally sees adults who are convinced they must have active disease because they have a positive tuberculin test. Parents of children in whom a positive test has been obtained are at times greatly alarmed and to a certain extent rightly so even though other evidence of tuberculous can not be obtained This anxiety should be used to trace the source of infection. To be honest and not alarming requires a nice balance of warn ing as to possibilities, and assurances as to probabilities in the future

Nor can one give too complete assurance in all instances even if the skin test is negative. After exposure, there may be a lapse of one to two months before the skin test is positive. Thus if severe exposure is known and the skin test is negative, it is well to recheck the test in two three months. Clinical developments in children may be rapid. I have seen three children severely exposed in one family and with origin ally negative tests develop pleurisy with affusion within a few months, although contact with the active case had been broken. In such families the tuberculin test should be repeated in about two months.

The presence of a positive tuberculm test in a child is a red flag that should lead us to examine the other members of the family. Were tuberculin tests done regularly in all children coming in for medical examination and were arrangements made to examine home contacts, less far ad vanced cases would fill our sanatoria. Here again there is a tendency for private physicians to leave such matters to organized public health agencies. Once, however, a positive tuberculin test has been found in a child the physician has a responsibility to the family and certainly a great opportunity to find early disease.

I have been interested in checking occasionally in Albany County how effectively tuberculosis is detected in routine medical work. Recent figures, that is, three years ago show that about one half visit a physician within one month of the onset of symptoms, three fourths within three months, one fourth wait over three months

The intervals between the first visit to a physi-

46 per cent.

cian and the making of the diagnosis were as follows

One week

One to four weeks
One to three months
Over three months
Over three months
The diagnosis was made by the first physician consulted in 64 per cent of the cases, by the second in 25 per cent, and by the third in 8 per cent Of these cases, 48 per cent had had sputum examined before admission

X-rays of the chest had been taken in 56 per cent

Thus we see that many cases present themselves to physicians but remain undiagnosed for a considerable time. About these, sanatoria and clinics can do little. The public, I believe, is now fairly well informed as to the value of x-rays and will respond with little urging if advised by their physician to have a film taken.

There are occasionally extenuating circumstances that, even with all due diligence, prevent the early diagnosis of tuberculosis nature of the disease itself The usual character of our public health teaching and even the concept implied in the terms of classification of the National Tuberculosis Association (minimal-moderately advanced—far advanced) is that of a disease starting in a small area and gradually spreading over larger and larger areas As a matter of fact, tuberculosis often extends by a series of extensive spreads, one might almost say by a series of explosions, with long intervening quiet pe-This is but one other indication of the necessity for repeated examinations in families with severe exposures, and a long follow-up of minimal cases whenever there have been any signs of instability under observation, and explains why with the best will in the world, some cases will never be put under treatment until far advanced

One other aspect of early diagnosis should be mentioned here The constantly increasing use of the bronchoscope has shown that bronchial tuberculosis is much more frequent than was previously thought It is present in at least 40 per cent of cases coming to autopsy and has been found in from 10 per cent to 15 per cent of routine bronchoscopies of tuberculous cases bronchial lesions give atypical findings and sometimes dominate the picture Wheezing, local impairment of ventilation as seen by the fluoroscope, mild atelectasis, and bleeding unexplained by x-ray are sometimes due to early bronchial Such cases are often diagnosed as asthma or bronchitis This is a serious error for in such cases a marked spread of disease may oc-Extreme caution and at times cur rapidly prompt radical surgical treatment is necessary Only by the use of the bronchoscope and at times by bronchogram can proper care of such cases be given

The subject given me includes the topic of differential diagnosis Time does not permit any exhaustive discussion of this subject occurrence, or at least the more frequent diagnosis. of atypical forms of pneumonia in recent years, has led to frequent errors in diagnosis In the presence of early soft infiltrate and the absence of usual pyogenic organisms an increasing number of cases of early tuberculosis are allowed to go on for some time without a proper There seems to be an inherent averdiagnosis sion to diagnosing tuberculosis, if another diagnosis reasonably can be given. The reverse should be true as tuberculosis is a more probable diagnosis

The use of the sulfa drugs and penicillin has contributed to the dangerous error. When a pneumonia fails to respond in the usual manner, it is not unusual to find that the physician falls back on the diagnosis of virus pneumonia, and if the fever soon recedes, allows the patient to go undiagnosed. This is but another illustration of the fact that new knowledge of disease and new methods of therapy sometimes lead to a neglect of the older and more probable diagnosis, and a delay in initiating proper treatment. Certainly, many of these atypical pneumonia cases at first cannot be differentiated from tuberculosis by x-ray or otherwise.

It is well to remember that hemoptysis is more frequent in bronchiectasis than in tuberculosis. The usual basal location of the lesion, the evacuation of sputum almost at once on inverted posture, especially if the sputum is foul, gives a clue to diagnosis that should be corroborated with a bronchogram

Abscess of the lung, especially chronic or multiple abscesses, gives a picture that only repeated sputum examinations can differentiate from tuberculosis

In case of emphysema with bronchits and periodic episodes of bronchopneumonia which clear slowly leaving fibrosis in the lung, it is often difficult to exclude tuberculosis, as the diffuse lesion is quite atypical—Such cases are dangerous spreaders of tubercle bacilli and should receive especially careful sputum studies

Carcinoma of the lung is often sent in as tuberculosis and many times cannot be differentiated at once. The age of the patient, the one-sided intensity of the lesion, especially with atelectasis, warrants careful sputum studies and prompt bronchoscopy. The necessity of differentiating tuberculosis of the bronchus from early carcinoma is obviously imperative and, I regret to say, often neglected.

A few times each year cases of acute exudative

tuberculosis, especially of the upper lobes, enters the hospital wards as pneumonin Persistent fever and lack of prompt response to drugs should arouse suspicion. Such cases may show pneumococci in the sputum The search for tubercle bacill should not be delayed nor cease with one or two examinations, as early sputa are often negative.

Sarcoidesis of the lung may cause confusion as it may closely simulate tuberculesis. Such a patient may spend unnecessary time in hospitals. The paunty of signs and symptoms in the face of extensive x ray changes and especially of a negative tuberculin test should clear up the diagnosis.

These are only a few of the diseases requiring differentiation. The various fungous infections, actinonycosis, and others, would require a discussion in themselves. Tuberculosis can simulate almost any chest disease. It is rare how ever, that a careful history, physical examination sputum studies, and x ray will not solve the problem.

With the decline of the death rate of tubercu losis to one fifth that of the beginning of the century, there is a tendency to be overly optimistic and complacent about it. Facts do not warrant this. The last five years have shown little decline in the death rate. It is still the most destructive and expensive disease we have in which the cause is known and for which effective treatment is available. Because of its very frequency

it is too apt to be accepted as part of the common burden of human misery. Were half a dozen cases of diphtheria typhoid, or smallpox to appear in one family group, a furor would be caused bringing out all community resources to combat it. Poliomyelitis causes great consternation yet last year there were but 88 polio deaths. All of these diseases together caused but a fraction of the number of deaths as compared with the number from tuberculosis—6 100 last year in New York State.

One hears a good deal these days about the possibility that never remedial agents, such as streptomycin, will in time greatly expedite the elimination of tuberculosis. If and when such agents appear it may be that treatment will be much improved. It is well to recall however, that even now our present methods of treatment are quite effective in minimal disease. Only loose thinking can lead anyone to believe that any new treatment will solve the problem of early diagnosis.

The disease cannot be treated until it is found nor will any treatment be as effective in the late as in the early case. Thus, new methods of therapy will not abate one whit the necessity of using all possible diligence in early diagnosis, in fact, their discovery and use will greatly in crease the responsibility and urgency of finding these cases early so that treatment may be used most effectively.

1947 House of Delegates

The regular annual meeting of the House of Delegates of the Medical Society of the State of New York will be called to order at 10:00 a.m. on Monday May 5, 1947, in Meeting Room G, Memorial Auditorium Buffalo New York.

In accordance with Chapter II Section 3, of the revised Bylaws, the House will assemble according to the following schedule

Monday, May 5 1947, 10:00 A.M Tuesday May 6 1947, 9:00 A.M. and 2:00 P.M. Wednesday May 7 1947 9 00 A.M.

At the last adjourned session (9 00 A M Wednesday, May 7) the election of officers, councilors trustees, and delegates will occur in accordance with Chapter III Section 1, of the revised Bylaws

It will be noted that the House will meet this year on three days, to permit time for the Reference Committees to work and make it unnecessary for the members of the Committees to be absent during the sessions of the House To avoid further conflict the section meetings will not start until Wednesday morning and the Annual Dinner will be held Wednesday evening

THE INCIDENCE OF PATHOLOGICALLY SIGNIFICANT TUBERCU-LOSIS IN ROUTINE NECROPSIES IN PRIVATE AND PUBLIC GENERAL HOSPITALS*

A Comparison of Two Periods 1916-1920 and 1940-1945

E M Medlar, MD, Mount Kisco, New York

(From the Department of Pathology, College of Physicians and Surgeons, Columbia University)

Vital statistics for the United States as a whole show that deaths from tuberculosis have decreased from 113 1 per 100,000 population in 1920 to 42 6 in 1943. One can assume that there must have occurred a considerable decline in the number of persons infected with the tubercle bacillus and that the incidence of pathologically significant tuberculosis in routine necropsies in general hospitals would show a similar trend during the past quarter of a century. To determine the validity of such an assumption, the records of routine necropsies in general hospitals have been analyzed.

This study presents an analysis of 14,719 necropsies with regard to the incidence of pathologically significant tuberculosis in private and public general hospitals The records of the hospitals have $_{
m been}$ following exammed Bellevue, Presbyterian, New York, Harlem, Babies', and St Vincent's in Manhattan, Long Island College Hospital in Brooklyn, and Grasslands Hospital in Westchester County, New All necropsies on individuals of 3 months or older, in whom a complete examination of body organs was recorded, were utilized available for the five-year period, 1916 through 1920, and the six-year period, 1940 through 1945. have been included

In addition, 1,177 records of complete necropsies from the Medical Examiner's Department of the Borough of Manhattan for the year 1943 were examined This group is composed of sudden deaths in which court proceedings might occur because of criminal action or criminal negligence, or in which the cause of death was It includes deaths from automobile accidents, from accidents at work, sudden death where there is no record of the case having been under the care of a physician, and all cases where foul play may be either apparent or suspected Since these cases are not drawn from any particular section of the city or any particular stratum of society, they may be considered to represent a small cross section of the city's inhabitants

The criteria used for "pathologically significant tuberculosis" in this study were as follows. A case was not considered as tuberculous unless the term "caseous" was used in the description of a tuberculous focus and unless such a focus was at least half a centimeter in diameter berculous involvement of greater extent, including a listing as the principal cause of death, was The reason for this rigid standard is that there can be a general agreement that a caseous focus is not a healed lesion and that from such foci there can occur an increase of the dis-These small caseous foci had no chincal significance in the cases in which they were recorded but it is from such foci, even much smaller than those accepted in this study, that clinically significant tuberculosis has its origin then of real pathologic significance

Results

A comparison of the necropsy records of private and public hospitals show that there has been a considerable shift in the age distribution when comparison of the two periods of time selected for study, namely, 1916 through 1920 and 1940 through 1945, is made, and the shift has been quite similar in both types of institution. There has been a considerable decrease in necropsies below 10 years of age and a corresponding increase over 50 years of age. Because of this similarity in all institutions the data from all hospitals are considered together in the comparisons for the two time periods.

An over-all comparison is presented in Fig. 1 The change in the number of necropsies under 10 years of age is most significantly shown in the records of Babies' Hospital where, in 1916 through 1920, 1,317 necropsies were done, whereas, in 1940 through 1945 only 225 necropsies were performed on children from 3 months to 9 years of age In the latter period over 50 per cent of all hospital deaths were necropsied Suitable records were not available in every hospital for the period of 1916 through 1920, but in those which did have good records, it was found that less than half as many necropsies were done In spite of the increase in as in the later period the later period, it is noteworthy that, propor-

Presented, by invitation at the 140th Annual Meeting of the Medical Society of the State of New York, Section on Chest Diseases, May 2, 1948

^{*} Sponsored by the Hegeman Memorial Research Fund.

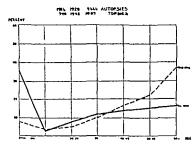

Fig. 1 Percentage—age distribution of neuropases in general hospitals.

tionally, there were fewer records up to the age of 50 years than in 1916 to 1920

The similarity of the necropsy records as a whole in the various hospitals makes it possible to compare the incidence of pathologically significant tuberculosis as a whole for the two periods. Fig 2 thus presents the percentage incidence of pathologically significant tuberculosis in the different age groups. The only significant change in the over-all picture in the twenty five years between the periods studied is a moderate decrease in the age groups 3 months to 9 years and 40 to 40 years, and an increase in the 20 to 29 year period.

A comparison of the two periods in the private hospital records shows that there is a decrease in all age groups except that of 20 to 29 years. In the public hospitals there is an increase in all age groups except two, namely, 3 months to 9 years, and above 60 years At Bellevue and Grasslands hospitals both public general hospitals tuberculosis services are available necropsies from the Tuberculosis Division are subtracted from the necropsy record as a whole, it is found that the incidence of pathologically significant tuberculosis varies but little from the figures found in the private hospitals for the 1940 through 1945 period It is common practice and correctly so, that all tuberculous cases, when so diagnosed are moved from the general wards to tuberculosis services As a result of this procedure the necropsy protocols show less tuberculoss in general hospitals than was present twenty The real significance of this five years ago situation is that despite the removal of the ma jority of recognized cases, there was present a residue of approximately 10 per cent of patients with pathologically significant tuberculosis in the general wards of both private and public hospi tals, insofar as can be determined from the necropsy protocols

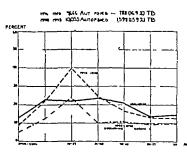

Fig 2 Percentage distribution of pathologically agnificant tuberculous according to ago.

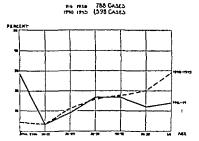

Fig 3 Percentage of pathologically significant tuberculods in different age groups derived from necropsies.

The percentage distribution of the cases with pathologically significant tuberculosis for the two periods is shown in Fig. 3 The two curves indicate that the incidence of pathologically ag nificant tuberculosis found in routine necropsies in general hospitals is the same in the two periods from the age of 10 to 50 years, less in age under 10 years, and more after 50 years. Two suggestions may be offered for this condition. First, the infection rate in adult life may not have changed Second, individuals with pathologically signifi cant tuberculous may be living longer than did similar cases twenty five years ago and are succumbing to other diseases This situation might influence to a considerable degree the mortality rate with regard to tuberculosis

These possibilities are borne out by the following observations.

1 In 2,364 necropses in the age group of 3 months to 9 years tuberculosis was mentioned in the protocols of 293 cases (12 4 per cent) and was the primary cause of death in 288 (12 2 per cent)

TB 654 (179%)

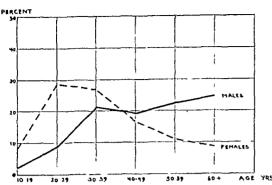

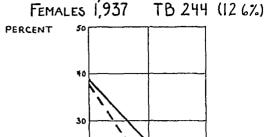

Fig 4. Percentage—age distribution of men and women with pathologically significant tuberculosis derived from necropsies

In only 5 cases was tuberculosis mentioned as an incidental finding in this whole group of necropsies once as a calcified pulmonary focus, three times as small caseous pulmonary foci, and once as a tuberculous ulcer of the ileum with associated caseous mesenteric lymph nodes. From these records it would seem that it is not common for a young child to carry an unhealed tuberculous infection into adult life, even if very small tuberculous foci were overlooked in some of the cases.

- 2 Among 342 protocols in the 10 to 19 years of age group, tuberculosis was mentioned 57 times (16 7 per cent), always as the primary cause of death. In this group it is probable that minute calcified and caseous foci may have been overlooked, but it is very unlikely that foci which would satisfy our criteria for pathologically significant tuberculosis would be missed. The tuberculous disease described in the protocols appeared to be universally of an acute rather than a "chronic phthisis" type. It was unusual to have tuberculosis listed in this group under the age of 14 years
- 3 Between the ages of 20 and 39 there were 2,274 protocols with pathologically significant tuberculosis in 586 cases (25 7 per cent) It was uncommon to have a caseous focus or a cavity listed as an incidental finding and calcified foci were infrequently mentioned
- 4 Of individuals above 40 years of age, there were 9,671 protocols, and pathologically significant tuberculosis was present in 1,393 instances (144 per cent) In this group calcified or caseo-calcific foci were mentioned occasionally. Not infrequently, caseous foci and even cavities were recorded as incidental findings. It is in this group that the primary diagnosis of cardiac disease, cerebral hemorrhage, cirrhosis of the liver, renal disease, and neoplasms relegate patho-

MALES 3,657

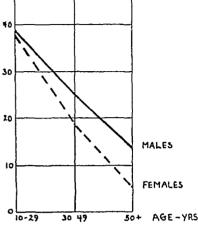

Fig 5 Percentage of pathologically significant tuberculosis in different age groups, showing comparison of men and women

logically significant tuberculosis to a lower level in the listing of anatomic diagnoses Many of these cases had active tuberulous disease with open cavities and were, without doubt, spreaders of the disease during life

In Fig 4 is shown the percentage distribution of cases with pathologically significant tuberculosis according to age and sex. In these curves practically all of the cases below 40 years of age died from tuberculosis, whereas, in those above this age, tuberculosis was often noted as of less significance than other disease processes difference between males and females is apparent Fig 5 presents the percentage of incidence of pathologically significant tuberculosis in all necropsies for the two sexes in different age groups It is evident that there is no difference in the sexes up to 30 years of age, whereas, after 50 years of age the male shows considerably more tubercu-From these two illustrations the impression is gained that with advancing years the male is more frequently infected than the female plausible explanation for this difference may be that men are more often exposed to infection in their daily intermingling with crowds of people, whereas women enjoy a somewhat more sheltered environment in the home

While examining the records it was noted that, at times, a considerable amount of tuberculosis would be described in the necropsy protocol without any mention of the disease in the clinical record. It became of interest to determine in which age groups this situation predominated A compilation of the records of 117 such cases is

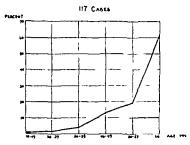

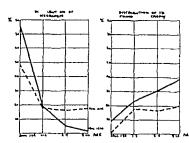

Fig. 6 Percentage—age distribution of pathologically significant tuberculous either not considered clinically significant or not recognized clinically

shown in Fig. 6 in which the percentage distri bution of the cases according to age is given Ninety five (81.2 per cent) of the cases were from individuals over 50 years of age. An example of such clinical oversight is the case of a 75-year-old dentist who had been under the care of his private physician for a considerable period of time for a heart desorder and finally entered the hospital where he died The listing of the anatomic diag noses in the necropsy protocol, in order of importance, were coronary occlusion, cardiac infarc tion, generalised atherosclerosis, chronic nephritis, and chrome fibrocaseose tuberculosis with cavitation The private physician was greatly surprised to learn of the tuberculous Drocesa

The reasons for this situation are multiple Tuberculosis may not be considered because of the age of the patient, the presenting symptoms and the clinical findings may not make one aware of the disease, a misinterpretation of the sig nificance of shadows in a roentgenogram of the chest may have been made, or the presence of other pulmonary diseases may have confused the With regard to this latter possibility, the records of the Chest Division at Bellevue Hospital are of interest. In 380 consecutive necropsies in which significant tuberculosis was recorded, this disease was not considered as a part of the clinical picture in 3 9 per cent. The disease processes which confused the picture were primary carci noma of the lung, metastatic neoplasms, pulmonary abscesses, and bronchiectases of the upper lobes In most instances failure to recognize tuberculous had very little to do with the even tual outcome of the case. It is well however, to be aware of the fact that open tuberculosis may be present in such patients, and that the disease can be spread by them just as effectively as if tuberculosis was the dominant disease process.

F10 7 Purcentage—age distribution of necropsies and of tuberculosis found at necropsy at Babies Hospital

That there is a growing awareness of this situ ation was found at Grasslands Hospital where roentgenograms of the chest for all hospital admissions were begun in 1942. Prior to that date they had discovered that a considerable number of cases with extensive tuberculosis were being mused in the general wards of the hospital Their necropsy protocols for 1040 and 1041 show that about 60 per cent of the cases with cavities in persons over 60 years of age had not been diag nosed clinically An examination of the records from 1942 through 1945 showed that it was un common for a cavity to be found at necropsy if tuberculosis had not been considered as a part of the clinical picture but that there were several cases where caseous foci were present. The interpretation of the pathologic significance of roentgenographic shadows are very important in these cases, for it is a rare case indeed in which there has been a tuberculous involvement of any extent in the upper lung fields that caseous foci cannot be found at necropsy Whenever shadows of any extent are noted, that case should have follow up roentgenographic studies and also tests for the presence of tubercle bacilli Such cases may readily be the contact source for new Caans

Fig 7 presents the data from Babies' Hospital It is remarkable that in this institution only one tuberculous death under 1 year of age occurred during the six year period of 1940 through 1945, whereas, in the five-year period of 1916 through 1920 there were 85 such cases Above 1 year of age the situation was not so favorable for the records showed 14 to 76 cases for the respective periods. A similar condition was found to exist in the pediatric services of other hospitals, all though the available data were considerably less. These records are in marked contrast to the data

COMPLETE AUTOPSIES - (177 (1877 ALL CASES)

PERCENTAGE DISTRIBUTION - TB CASES BY AGE 60 CASES (51%)

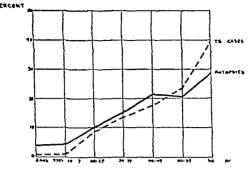

Fig 8 1943 Medical Examiner's Cases Total, 6,289

on the incidence of pathologically significant tuberculosis in adults

For a glimpse into the tuberculosis situation among people who were supposedly well one day and dead the next, the Medical Examiner's records of the Borough of Manhattan for the year 1943 were studied During that year 6.289 bodies were referred to the department, and in 1,177 instances (187 per cent) a complete necropsy was performed In these cases the feature of major importance was to determine the immediate cause of death Because of a limited technical staff, the associated pathologic findings of minor significance were frequently not recorded As a consequence the records contained only a minimum of information with regard to small caseous tuberculous foci Fairly good-sized foci and cavities were recorded Fig 8 presents the percentage distribution of the necropsies and of significant tuberculosis as to age There was no mention of tuberculosis in the protocols of 75 cases under the age of 20 years Tuberculosis was recorded in all other age groups, varying from 42 per cent in age 20 to 29 years to 73 per cent in age over 60 years As in the hospital cases the difference in male and female in the older age groups was striking In the age group twenty to twenty-nine years, there were 69 males with a record of tuberculosis in 3 (4 3 per cent) and 49 females with 2 tuberculous (4.1 per cent) In age over 50 years, there were 452 males with tuberculosis recorded in 34 instances (75 per cent), whereas in 102 females, tuberculosis was mentioned in but 3 instances (2.9 per cent) this group there were 60 cases (5 per cent) of pathologically significant tuberculosis with death from tuberculosis being recorded in 12 instances Thirty-seven (61 7 per cent) only (1 0 per cent) of the 60 cases showed cavity and rather extensive disease, 1e, 3 per cent of the entire group, a striking instance of how active tuberculosis may be hidden in necropsy files

In a series of 1,300 Medical Examiner's cases which were thoroughly examined by the author in 1944 and 1945, cavities were present in 52 instances (4 per cent). No cavity was found in 104 cases under the age of 20 years and 5 6 per cent of 588 cases over 50 years showed the presence of cavity formation. This corresponds fairly closely with the record for the year 1943.

Comment

Protocols of routine necropsies record a fairly accurate description of the major disease processes but they fail to contain information on many "incidental" pathologic conditions, 1e, a hemangioma of the liver a few millimeters in diameter might not be recorded, whereas one, several centimeters in diameter, would be mentioned Data from this source have a very limited value if the incidence of tuberculous infection is sought This is one of the reasons why rigid criteria for "pathologically significant" tuberculosis have been adhered to in this study and it is recognized that the information gained is not complete

The data, even with its limitations, depicts more accurately the sources from which tubercle bacilli may be spread than can be obtained from vital statistics or mass x-ray or tuberculin survey. The information from the routine hospital necropsies indicates in what age groups of patients a greater alertness for tuberculosis should be exercised. The data from the Medical Examiner's records provides a glimpse into the problem in the population at large.

The data presented in this study reveals a big advance in the prevention of tuberculosis in babies in the first year of life There is no evidence that the increase of the disease in young adults is a result of a chronically progressive infection acquired in childhood The evidence suggests these infections are incurred in adult life and that adults continue to be infected throughout life, for the largest number of cases are found in individuals over 50 years of age especially true in the male which suggests that men are more frequently exposed to infection The data seem to indicate that very little progress has been made in solving this problem in the past twenty-five years, at least in metropolitan New York

A considerable amount of active tuberculosis never appears in death registries because other diseases very often are the actual causes of death. This is particularly true in the older age groups. It is in this group that open tuberculosis is most frequently unrecognized. This accounts in large part for the considerable number of tuberculous cases still present in general hospital services despite the active campaign to segregate such cases.

as soon as diagnosed. It is unusual for tuberculous cases not to be so diagnosed below the age of 40 years

It seems unlikely that the control of tubercu lous infection in the adult can make much progress unless this large group of pathologically active tuberculosis in the older ages is properly handled To accomplish this there will have to be a more alert consciousness of this situation One step which should be of great value would be to have chest roentgenograms of all patients over 50 years of age admitted to hospital wards, especially the males. If shadows of any extent are observed in such roentgenograms, they should not be regarded as innocuous no matter how dense they may be, for not infrequently a cavity may be obscured within the shadows.

It may well be that a considerable number of these cases will not need active clinical treatment when discovered They should, however, be carefully studied and treated with due respect in regard to the possibility of spread of the disease

The discovery and treatment of tuberculosis in its early stages is of utmost importance, and it is of equal importance to control the sources from which the infection may be spread to other per-In the second part of this program the problem may not be as much one of active medical care as of education and of segregation telligent leadership in this phase of the problem must be assumed by the medical profession as a whole, if the disease is to be brought under satisfactory control

Summary

An analysis of 17,196 necropsy protocols from routine pathologic services is presented with regard to the presence of "pathologically signifi cant" tuberculosis. A comparison of the periods 1916 through 1920 and 1940 through 1945 shows that the incidence of significant disease in adults is approximately the same in the two periods Below the ago of 40 years pathologically significant tuberculosis is recognized clinically in a very high proportion of the cases Over the age of 50 years a considerable number of such cases are unrecognized In the older age groups the tu berculous infection frequently is not recorded either as the chief or as a contributing cause of death, even if cavity formation and pathologi cally active disease are present

The existence of a considerable group of unrecognized and innocent spreaders of tubercle bacilli poses a serious problem One method of approach toward a solution of this problem would be the institution of chest roentgenograms of all patients over 50 years of age who are admitted to hospitals, regardless of other clinical conditions Especial emphasis should be placed upon such examinations in male patients. All cases in whom shadows are thought to be tuberculous in nature should have careful study by senal roentgenograms and for the discharge of tubercle bacilli, regardless of the first impression as to the significance of such shadows

Nors The author desires to express his appreciation for the many courtenes extended by the authorities in the various hospitals which made this study possible.

POSTGRADUATE INSTRUCTION NOW AVAILABLE

A program for the current year has been issued by the Committee on Public Health and Education in the form of a Course Outline Book

This provides for postgraduate instruction in a wide variety of subjects includin gallergy, bacteriology cancer dermatology industrial health, general medicine obstetnes gynecology orthopedics, pedi

atrice, psychiatry, surgery venereal diseases, and others

Lectures and demonstrations based on these topics are available for county societies hospital staffs, and other medical groups. For further information address Dr O W H. Mitchell, director 428 Green wood Place, Syracuse, 10 New York,

FELLOWSHIPS FOR PHYSICIANS AND ENGINEERS

Announcement is made by Surgeon General Thomas Parran of the U.S. Public Health Service that applications for fellowships in peetgraduate public health training for physicians and engineers for the school year beginning in the fall of 1947 will

be received at any time prior to May 1, 1947

The fellowships are made possible by a grant of \$228,400 from the National Foundation for Infantile Paralysis through funds contributed to its March of Dimes Fifty three students were awarded fellowships for the school year beginning in September 1946

The fellowships provide an academic year's gradu-

ate training of approximately nine months in an accredited school of public health or an acceptable school of sanitary engineering followed by three months of field training, and are open to men and women, citizens of the United States, under 45 years of age.

Physician applicants must have completed at least a year's internahip

Applicants for fellowships may secure further details by writing to the Surgeon General, U.S. Public Health Service, 19th and Constitution Avenue, N.W., Washington 25, D.C., Attention Public Health Training.

THE USE OF THE BRONCHOSCOPE IN THE DISEASES OF THE CHEST

JOHN D KERNAN, M.D., New York City

IT IS significant of the continued interest in bronchoscopy that the present writer read a paper on this same subject before the State Medical Society twenty-five years ago The bronchoscope at that remote time was used chiefly for the removal of foreign bodies from the bron-Realization of its value as a means for the diagnosis and treatment of intrathoracic disease was only just dawning Since then the field has greatly expanded

Extrabronchial and intrabronchial disease In its course through the must be considered mediastinum, the trachea is intimately related to the esophagus, the lungs, the aorta, the left recurrent larvngeal nerve, and numerous lymph

nodes

Pathologic changes in any of these structures may alter the position, the direction, the lumen of the trachea, and such alterations can be noted on bronchoscopy One might say that any patient complaining of a persistent cough. wheeze, dyspnea, or dysphagia should be bron-

The chains of gland running up along each side of the trachea are especially liable to give trouble If only slightly enlarged and calcified, the result is only an annoving cough Further enlargement will bring about such distortion of the trachea and compression of its lumen that wheezing and even severe dyspnea may result Occasionally calcified glands will erode the tracheal wall and appear inside The symptoms of such an accident are very severe and can be relieved only by bronchoscopic removal of the calculi

Enlarged glands in the hilum of the left lung may cause left vocal cord paralysis A bronchoscopy will reveal the distortion of the left main bronchus caused by such enlargement and explain an otherwise obscure case

Tuberculous glands, especially in children, have a tendency to break down and form abscesses which rupture into the trachea or bronch Immediate death may result from drowning or widespread infection may cause prolonged illness Prompt bronchoscopic aspiration will prevent such dire results

Other causes of mediastinal lymph node enlargement are those which involve lymphatic tissue generally, such as Hodgkin's disease, lymphosarcomas, malignant metastases, and the

Presented at the 140th Annual Meeting of the Medical Society of the State of New York Section on Chest Diseases May 2, 1946

Cough, wheeze, or dyspnea may be the like first symptoms A bronchoscopy will certainly aid in the diagnosis

Many other conditions may give rise to these same symptoms of wheeze and dyspnea We have seen infants subject to attacks of evanosis Compression of the trachea by an from birth enlarged thymus will be found in such cases. a similar appearance is caused by substernal thyroid tumor in adults Care should be taken to make the correct diagnosis such cases are treated for prolonged periods An aneurysm of the aorta will as asthma at times give symptoms suggestive of asthma and be treated as such It is not always easy to make the differential diagnosis in the early stages, not even by x-ray I once bronchoscoped a man who had been treated many months for Examination of his larvnx showed a right vocal cord paralysis. This is quite unusual so a bronchoscopy was decided upon This revealed a pulsating tumor compressing the trachea high up in such a position that only the right innominate artery could do it

Formerly, early diagnosis of aneurysms was not so important since little could be done for Now they can be treated surgically

Occasionally, tumors of the esophagus, those involving the party wall, will compress the trachea or erode its wall I saw one case in which the first symptom was coughing up of food, no more can be done for such patients than taking a biopsy

It has been emphasized that most of these mediastinal troubles imitate asthma How about the use of the bronchoscope in true bronchial asthma? Its necessity for differential diagnosis ought to be clear from what has been said can also be useful therapeutically Many cases of asthma have a basis of chronic bronchitis It is useful to treat such patients with autogenous vaccines prepared from the bronchial secretions secured bronchoscopically Then an attempt can be made to control the infection by insuffiation of one of the sulfonamide powders Some favorable results have been reported from this Symptomatic relief is occasionally secured by as-My own expepiration of the heavy secretions rience with these cases has not been extensive

The intrabronchial lesions for the diagnosis and treatment of which bronchoscopy is indicated must now be considered A bronchoscopy is done for prophylaxis, diagnosis, and treatment

Lung Abscess

The probability is that most lung abscesses are caused by the aspiration of foreign material during operations, especially operations about the mouth, such as tonsillectomy. A smaller number are due to infected emboli, which may lodge in the lung following operation. It would seem to be a reasonable precaution whenever there has been vomiting during anesthesia, or unusual bleeding during operations on the mouth that a bronchoscopy be done on the table to clear the air passages. If there is reason to believe that any foreign body has been aspirated it should always be searched for before the patient leaves the table. This would prevent many lung abscesses.

All lung abscesses should be bronchoscoped at least once for diagnostic purposes. This will rule out the presence of a foreign body and aid in localizing the abscess by identifying the discharging bronchus. As for treatment of lung abscesses the first aspiration may be curative if done early Of 27 cases of post-tonallectomy abscesses, 18 recovered promptly after one bronchoscopy. Even chronic cases will at times recover without operation. It is, however, now considered best to resort to surgical means if the case is not improving after a few weeks of medical care and weekly bronchoscopic drainage.

Bronchiectasis

Many cases of bronchiectasis start in infancy or childhood following unresolved pneumonia. These cases appear to be due to retained secretions with a consequent collapse of a portion of a lung, bronchiectasis follows. As a preventive measure, such cases should be bronchescoped and aspiration carried out. This procedure would doubtless result in many cures.

Bronchiectasis of longstanding cannot be cured by bronchoscopy Such cases if localized are best treated surgically If the disease is widespread with foul discharge, long-continued bronchoscopies will greatly better the symptoms and enable the patient to lead a comfortable life Bronchoscopy is done at first at weekly, later at monthly, or even longer, intervals. In my experience, which is somewhat limited, urigations injection of penicillin, and insufflation of powders give no better results than simple aspiration

Bronchlectasis is a fairly frequent source of hemorrhago. If the chest films are negative, the diagnosis may be exceedingly difficult to make. The question always arises as to when to do a bronchoscopy, while the patient is bleeding, or in a free interval when it is perhaps safer. If the latter course is adopted, there will be no evidence to guide the search I think one may say that it is better to bronchoscope during the bleeding when it is possible to trace the blood to its source Then lipiodol carefully placed under the guidance of the fluoroscope may demonstrate a small abscess or bronchiectasis otherwise in visible.

Tumors

Tumors of the bronch, benign or malignant, cause no symptoms until obstructive. Then lung collapse infection and suppuration follow Benign tumors, as compared to malignant, are rare. I have seen one lipoma, one chondroma, one papilloma, and approximately thirty adenomas. The lipoma and chondroma were successfully removed. The papilloma occurred in an infant about the carina and suffocated the child.

Benign Tumors—Benign adenomas, unless they bleed, cause no symptoms until obstructive. Then, a secondary bronchicetasis results Most of them are treated as tuberculous until the correct diagnosis is made by bronchoscopic biopsy. If untreated they grow locally for many years and may destroy by pressure a whole lung. The bleeding will be very severe at times.

Probably the best treatment is lobectomy The intrabronchul part of the tumor can be destroyed by diathermy. They are, however, almost invariably also extrabronchial. This part will continue to grow even after successful intrabronchial treatment, and will ultimately destroy the lung. A ten-year survey of my cases showed that seven out of ten recurred after seeming disappearance after diathermy.

Malagnant Tumors—All authors agree that there is a very disturbing increase in the frequency of carcinoma of the lung, both relative and absolute The cause of this increase is no more known than the cause of other carcinomas.

These tumors arise most frequently in the larger bronchi and grow rather slowly at first. Unfortunately, they are liable to be symptomless until large enough to block a bronchus Then all the symptoms of a blocked bronchus appear but, by this time the regional lymph nodes are in volved and the case is inoperable. Diagnosis is made by considering the symptoms, physical signs, x ray films, and by bronchoscopy

The last gives the best chance of an early diagness As already mentioned, these cases are symptomless until well advanced The early symptoms may not be at all suggestive. There may be a feeling of weakness fatgue, in somnia, slight anema even complaints which suggest gastro or intestmal involvement. Tonsils are sometimes removed and sinuses drained on the ground that these may be foci of infection

When, finally, cough, hemoptysis, dyspnea, and chest pain suggest the true diagnosis it will be too late for operation

It is thus, also, with the physical signs Only a large growth will give physical signs which can be detected by percussion or auscultation. They depend for their production on the presence of a blocked bronchus, an obstructed bronchus is always so late in development that the mediastinal glands are involved which makes for a poor prognosis.

Radiology offers more hope of an early diagnosis than either symptoms or physical signs A routine film of the chest which should be taken of all ailing men or women over forty will pick up even a small shadow which is significant. But the mere presence of a shadow does not make the diagnosis. Many conditions can give small shadows in the lungs

Means must be found to make the differential diagnosis. The means is a bronchoscopy. Recall the fact that the majority of these growths arise in the main bronchi, accessible to the bronchoscope. If a biopsy can be made, a sure diagnosis is given and, possibly, a very early diagnosis. Recently, on bronchoscopy a carcinoma was found so small that it was completely removed by the biopsy forceps. At the same time, valuable information is secured as to the amount of free bronchus above the growth, the condition of the glands about the carina, and the existence or not of infection, all bearing on the operability of the case.

Of course, symptoms, physical signs, and x-ray films must all be taken into consideration. But neither singly nor altogether can they give a diagnosis of carcinoma of the lung sufficiently early to allow any large degree of success on operation. Bronchoscopy alone will do that

Although the majority of malignant tumors arise in the larger bronchi, many are beyond the reach of the bronchoscope, either in an upper lobe bronchus or in a bronchus so small that the bronchoscope will not enter

In those thought to be in an upper lobe bronchus a pneumothorax should be done. This will bring the bronchus in line and permit its inspection. In regard to the smaller bronchi one must depend on examination of material removed by aspiration. This is said to be successful in a large percentage of cases. A small flexible tube will enter a very small bronchus, so the securing of the secretion ought to be very simple. The pathologist would have to be very well trained to identify all the various cells, normal and pathologic

One should not be discouraged by a negative report, even though all other symptoms and signs point to the presence of a carcinoma. A nega-

tive report means that there is a good chance of operative success

Tuberculosis

It is said that 15 per cent of all patients entering sanatoria for tuberculosis have tracheobronchial involvement. A much larger percentage of the fatal cases develop that complication. Since diagnosis can be made and treatment carried out only by means of bronchoscopy, it will be seen how important for the efficient treatment of pulmonary tuberculosis the bronchoscope is

Observed through the bronchoscope, the earliest stage is edema of the mucous membrane Then follow shallow ulcers, ulcers with granulation tissue, sometimes forming tumors, deep, destructive ulcers, and, finally, the healing stage with strictures and deformities from scar tissue The chief symptom at this stage is a wheeze

Some bronchoscopists recommend no treatment, maintaining that if the pulmonary condition improves, the bronchial also will I do not agree with the expectant attitude More active treatment should be carried out There is no doubt that fortnightly treatments with almost any one of a number of means will hasten healing Among those suggested are the application of 30 per cent silver nitrate to granulation tissue, the removal with forceps or cauterization of granulation tissue tumors, the aspiration of retained secretions, and the stretching of the strictures

The bronchoscope has a wide field of usefulness in chest surgery There is no doubt that bronchoscopic treatment before operation will make the patient a better operative risk For instance, in cases of lung abscess, bronchiectasis, and bronchial tumors with infection, several bronchoscopies will certainly reduce the chances of Postoperatively, postoperative complications the removal of secretions is, at times, a lifesaving All cases for pneumothorax and measure thoracoplasty, where tracheobronchial disease is suspected, should be bronchoscoped complications can be prevented by this precaution

I wish to put in a plea here for better bronchoscopies. The difficulty is not in the mere passing of the bronchoscope. That is easily done. The cases should be better prepared for the bronchoscopist, sent in with films, history, and a statement of what is suspected. This will save much time and the patient's nerves. The operator should know which side to search first and what to look for. Cases should not be sent for bronchoscopy an hour before it is done. The bronchoscopist on his part should have his operating room team well organized, so every needed instrument is ready at hand. The study of secretions

should be carried out by a most competent pathologist. Thus planned there will be few negative bronchoscopies.

130 Cast 78th Street

Discussion

Dr Charles C. Wolcott, Bronzville.-The roll of bronchoscopy in thoracle disease is very well establabed and the coverage of the subject by Dr Kernan was both complete and comprehensive I desire briefly to elaborate on the matter of "the negative bronchoscopy

I am sure there have been times when we all have been disappointed in the report following an endoscopic procedure. All the evidence seemed to indi cate that a bronchoscopy would clarify a given case history yet the report was negative.

There are three main reasons for this

It may have been a case in which the bronchoscopic findings were actually negative. If so this negative report then constitutes a positive finding.

2. The technic problem may have been too great

for the endoscopist.

3. The pathology may have been overlooked or minuterpreted.

The reasons for the second and third are the same

There may have been inadequate premedication, in adequate anesthesis, inadequate assistants, or inadequate training of the operator The last is the most important. The question is 'How are we to train the endoscopist adequately? The technical aspects of endoscopy are great and must include the ability to recognize detailed bronchial anatomy No one should do bronchoscopy on the living until a considerable degree of technical proficiency has been acquired Certain fundamentals can be acquired in the anatomy laboratory or on properly anesthetized animals.

However I have found that the best way to acquire skill as by practicing on fresh cadavers. I have insisted on my students doing this. They are urged to take all necessary instruments to the morgue and repent many many times the entire procedure as they would do it in the operating room. Such training has been more valuable than any Here the student learns to identify all seg mental bronchial orifices normally visible. He acquires dextenty so imperative for a nontraumatic endoscopic procedure and he learns to identify all structures.

There are several short courses given in various hospitals. Theoretically they are excellent. Actually they may not be As postgraduate or refresher courses they have a very definite place. It would seem wise to limit these courses to those students with considerable basic experience and a definite opportunity for further practice under su pervision.

After one has acquired adequate technical ability there still remains the more difficult field of proper interpretation of what one sees. This again requires a long apprenticeship under supervision.

Therefore, it would seem that in order to eliminate the many negative or unsatisfactory endoscopies we must devote more time to training the endoscop

HOTEL RESERVATIONS FOR ANNUAL MEETING

Reservations are being made in the following hotels in Buffalo for guests at the Annual Meeting

> Buffalo Washington and Swan Streets

Richford 210 Delaware Avenue Graystone 24 Johnson Park

Washington and Clinton Streets Lafavette

140 North Street Lenox Main Street at Utica Street Markeen

Niagara Square Statler 274 Delaware Avenue Touraine 245 Elmwood Avenue Stuvvesant Westbrook 675 Delaware Avenue Worth 200 Main Street

Sheraton 715 Delaware Avenue

It is essential that those desiring to attend the Annual Meeting make reservations as soon as possible

SURGERY IN DISEASES OF THE CHEST

HERBERT C MAIER, M D, New York City

THE importance of surgery in the management of diseases of the chest has increased greatly during the past two decades. The foundation for this development dates back many years, but it is only recently that surgical procedures within the thorax have been performed with a degree of safety comparable to that of abdominal surgery. Advances in anesthesiology, a better understanding of thoracic physiology, improved methods of avoiding surgical shock, chemotherapy, and better care of the patient before and after operation have been chiefly responsible for the improved results.

Empyema—The incidence of infections of the pleura has been markedly reduced as a result of the use of sulfonamides and penicillin in the treatment of pulmonary and other infections. If an empyema does develop, thoracentesis is performed in order to determine the character of the fluid

Immediate smears are made and the fluid Confusion may arise between a 18 cultured pyogenic and a tuberculous empyema because previous penicillin therapy may result in a failure to culture pyogenic organisms present in the fluid If the empyema is caused by an organism that is affected by penicillin or streptomycin, and if no bronchopleural fistula of appreciable size is present, intrapleural treatment with one of the antibiotics is advised It is most essential that the pus be thoroughly evacuated at each thoracentesis before the penicillin or streptomycin is introduced into the pleural space Re-expansion of the lung, combined with sterilization of the pleural space, is the goal in the treatment of an empyema

Thoracentesis should be done without permitting air to enter the pleural space. Air replacement is distinctly contraindicated. Thoracentesis should be done several times a week and penicillin or streptomycin introduced into the pleural space at each tap. Surgical drainage of a pyogenic empyema is indicated (1) when there is a bronchopleural fistula of sufficient size to permit entrance of pus into the tracheobronchial tree, (2) when the empyema is due to an organism uninfluenced by the antibiotic, and (3) if sterilization of a pyogenic empyema is not obtained soon by nonsurgical means. No case should be considered cured until the lung is re-

expanded and the pleural space obliterated As long as any fluid remains in the pleural space, even though cultures are negative, there is a real possibility of future trouble

Pulmonary Abscess—Penicillin and sulfonamide therapy have reduced the incidence and severity of pulmonary suppuration. When an abscess develops in the lung, the results of penicillin therapy are often unpredictable. The cardinal principal of all chemotherapy is to determine whether the causative organism is susceptible to the agent employed. Since a mixed flora is common in pulmonary abscesses, and since some of the organisms may not be susceptible to the chemotherapeutic agent employed, it is often unpredictable whether marked benefit will be obtained.

Much may be accomplished by penicillin therapy in the aerobic pulmonary abscess. If the lung abscess is characterized by foul expectoration and numerous anaerobes are present, the chemotherapeutic agents so far available have often given disappointing results. In this latter group surgical intervention is frequently indicated

The aim of treatment of an acute pulmonary abscess is to obtain subsidence of the infection before chronic changes have occurred in the cavity wall and the adjacent pulmonary tissues When one is dealing with a solitary abscess cavity, especially if the sputum is foul, surgical drainage should be undertaken early if the patient does not show progressive clinical and roentgen evidence of improvement on conservative medical measures and chemotherapy If surgery 15 deemed advisable in an acute lung abscess, drainage is usually the procedure of choice Accurate localization is the keystone to success in the surgical drainage of an acute pulmonary abscess The procedure is preferably performed under local anesthesia in one stage Neglect of details on the part of the surgeon may change a simple, safe operation into a serious one with many complications

Surgical drainage alone is usually unsatisfactory in the treatment of pulmonary suppuration characterized by extensive pneumonitis and the presence of multiple small abscesses. Lobectomy or pneumonectomy is the preferable form of therapy for suppuration which has produced irreversible damage to the pulmonary parenchyma and bronchi. Chemotherapy plays an important role in this type of case in overcoming the acute

Presented at the 140th Annual Meeting of the Medical Somety of the State of New York, Section on Chest Diseases May 2, 1946

phase and in lessening the risk of spread of the infection during and following operation Follow-up bronchographic studies have shown that many lung abscesses, whether treated by surgical drainage or subsiding after spontaneous evacuation of the pus through the bronchus, do not undergo true healing Frequently a cavity, often with an epithelial lining, persists Infection may again flare up in such a cavity If symptoms persist, or if there are recurrences of the infection. resection of the diseased portion of the lung is indicated Although the hazard of lobestomy and pneumonectomy for pulmonary abscess is somewhat greater than the risk of lung resection in bronchiectasis, the postoperative morbidity and mortality have been considerably diminished in the past few years. The author has had a mortality rate of less than 5 per cent for lobectomy and pneumonectomy for chronic lung abscess.

Bronchectasis - Surgery plays an important part in the treatment of bronchiectasis. Al though much can be accomplished by chemotherapy in bronchiectasis, the role of this therapy is chiefly in the management of the acute ex acerbations of the infection The indications for surgical treatment for chronic bronchiectasis have not been appreciably changed by the advent of penicillin. In evaluating the results of treatment of bronchiectasis, it is most essential to bear in mind the spontaneous fluctuations in the severity of the symptoms that characterize this condition Surgical treatment is indicated if the cough and the purulent expectoration are more than minimal in amount, or if hemoptyses occur, provided the disease is sufficiently localized for surgical removal and provided there is no contraindication as far as the patient's general condition or pulmonary function is concerned Extensive pulmonary emphysems is often a contraindication to radical surgery The excel lent results which may be obtained by lobectomy in bronchiectasis have been amply demonstrated in many clinics. The record of the Army chest disease centers during the recent war has been outstanding It should not be forgotten how ever, that a trained thoracic team is essential for the best results in this type of surgery author has had one hospital death in the last 100 consecutive cases of lung resection for bronchiectasıs This series includes pneumonectomies as well as partial and total lobectomies.

Cytic Disease of the Lung —A wide variety of leaions have been classified under the heading of cystic disease of the lung Treatment depends upon the type of pathology present in the individual case. Some so-called pulmonary cysts are nothing more than areas of localized obstructive emplysems, or emphysematous blebs which

require no therapy Sometimes the pulmonary cyst becomes markedly overdistended, due to positive pressure within the cavity resulting from a ball-valve mechanism in the draining bronchus. In some such cases decompression or surgical excision of the tension cyst may be indicated. Needling of such cysts may be dangerous, due to the possibility of secondary tension pneumothorax.

Pulmonary cysts lined with epithelium frequently require surgical excision, especially if infection has occurred. It is often difficult to distinguish between congenital pulmonary cysts and cyst-like spaces in the lung which are the result of chronic pulmonary infection. Lobectomy and pneumoneotomy give good results in those cases in which surgery is indicated.

Pulmonary Tumors -Although the vast ma jority of tumors of the lung are malignant and cause death within a few years, there are some pulmonary neoplasms of low-grade malignancy which invade locally but only occasionally have regional and rarely distant, metastases. The so-called bronchial adenoma is the most common tumor of this type. If the lesion is properly diagnosed and treated, excellent late results may be obtained. The accumulated evidence today indicates that the preferable form of treatment is lobectomy or pneumonectomy Cauterisation of the endobronchial portion of the adenoma through the bronchoscope has not given satisfactory late results in most instances. Endoscopic treatment alone still has an important place, however, in the treatment of those patients in whom, because of general condition or age radical surgery is contraindicated. If the lezion extends into the trachea, endoscopic removal and occasionally radiation are helpful. Cautemation through the bronchoscope alone has often been unsatisfactory because of the extension of the tumor through and outside of the bronchial wall, and because of the high incidence of secondary suppuration which has caused sufficient damage to indicate resection of the involved portion of the lung Some bronchial adenomas cannot be visualized through the bronchoscope because they arise from a smaller, more penpheral branch bronchus

Carcinoma of the lung is a common form of cancer today Surgical excision, usually by pneumonectomy, is considered the preferable form of therapy A distresangly large per centage of patients are referred for treatment when the lesion has already extended from the lung into the adjacent mediastinum, or there is other evidence of metastases Both patients and physicians are often responsible for this situation. The reasons for this delay are chiefly the follow inc.

- 1 Most men with carcinoma of the lung are heavy smokers of cigarettes, and have a history of chronic cough dating back many years Therefore, little significance may be attached to some increase in this chronic cough
- 2 The early roentgen appearance of a carcinoma of the lung may be merely a small area of increased density which cannot be distinguished radiographically from many other lesions. Every shadow seen on a roentgenogram requires extensive investigation, even though the patient may be entirely asymptomatic. It is often much wiser to perform an exploratory thoracotomy than to merely observe the changes in the roentgen appearance over a period of months.
- 3 Delay in treatment may be caused by placing too much reliance on negative bronchoscopic findings. Although the tumor is visible bronchoscopically in the majority of patients with carcinoma of the lung in the late stages, bronchoscopic visualization and biopsy of the tumor is possible only in the minority of the early cases. Exploratory thoracotomy is indicated whenever there is real suspicion of carcinoma, provided the patient's condition does not contraindicate radical surgery. Even though an exact diagnosis cannot be reached, too much time should not be lost trying to differentiate between several types of lesions, all of which might be best treated by surgical removal.

The surgical results, both immediate and late, of carcinoma of the lung are rather similar to those of carcinoma of the stomach. In my own experience, the mortality of pneumonectomy for malignant tumors is now less than 5 per cent, and there has been one death in a series of over 20 lobectomies and pneumonectomies for benigh tumors and those of low-grade malignancy. The distressing feature is not the risk of surgical intervention, but the fact that so many cases are too advanced at the time that surgical exploration is undertaken.

Pulmonary Tuberculosis—Surgical therapy plays an important role as a supplement to general medical measures and rest treatment in the care of the patient with pulmonary tuberculosis. Although a considerable variety of surgical procedures have been employed in pulmonary tuberculosis, only a few have stood the test of

time In dealing with a chronic disease, an analysis of late results is far more important than a report of the patient's condition shortly after operation

The old concept of always attempting an artificial pneumothorax before considering a thoracoplasty has been shown to be unwise original aim of pneumothorax was to control the lesion by temporarily collapsing the lung due to the type or extent of the disease present. it is anticipated that the lung can never be reexpanded, a primary thoracoplasty may be preferable to pneumothorax Studies of lung function after pneumothorax and thoracoplasty have shown that the advantage of pneumothorax over thoracoplasty from the standpoint of conserving pulmonary function is not as great as was orga-In fact, a partial thoraconally anticipated plasty often gives a better functional result than a pneumothorax which has been complicated by pleural fluid If the tuberculous lesion is limited to the upper portion of one lung, a primary partial thoracoplasty may be preferable to artificial pneumothorax

Intrapleural pneumonolysis may often convert an ineffectual pneumothorax into a satisfactory one Extensive pneumonolyses are not indicated in cases of predominantly unilateral tuberculosis if a partial thoracoplasty could be substituted for the unsatisfactory pneumothorax

There has been much discussion concerning lobectomy and pneumonectomy in the treatment of pulmonary tuberculosis Lung resection should not be regarded as a substitute for thoracoplasty, but should be restricted to the following cases (1) tuberculosis of the larger bronch with a high degree of stenosis or secondary infection, (2) parenchymal cavities of a type or location in which thoracoplasty seems very certain to be a failure, (3) the failures of thoracoplasty, and (4) tuberculomas

Provided the dissection type of lobectomy or pneumonectomy is performed, and all precautions are taken to avoid the spread of the tuberculosis during operation, the patient's immunologic reaction to tuberculosis is the most important factor in the late result. Therefore, the selection of cases for resection will greatly influence the statistical results

FACTORY REBUILT

A native pearl diver was brought to our Persian Gulf hospital His leg had been badly mangled by a shark

Despite his injury he was in good spirits. This was his first contact with white men and civilization. Even such a matter as turning on an electric light seemed like a first-class miracle to him.

A few days after the doctor had performed the necessary amputation, he asked "How does it feel?" Whereupon the patient answered, "Just fine The leg doesn't hurt a bit since you took it off When will it be well enough to put back on?"—M D, CALIFORNIA—Medical Economics, December, 1946

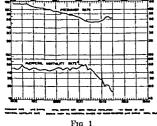

MATERNAL MORTALITY IN BROOKLYN FOR 1945

CHARLES A GORDON M.D. FACS, Brooklyn, New York

IN 1933 the puerperal death rate of the City of New York began its decline from a previously high level The puerperal death rate per 10 000 reported terminated pregnancies was 139 in 1945, when 203 deaths were assigned to puerperal causes

The character and consistency of this reduction in the number of puerperal deaths is best shown graphically as in Fig 1

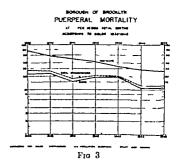

The puerperal death rate for the nonwhite population, which has always been higher rose from 27 7 in 1944 when there were 33 deaths, to 33 9 in 1945, when 48 deaths occurred So that the statistical importance of the colored popu lation of the City of New York may be better appreciated this rise is shown graphically in Fig 2

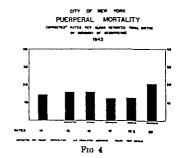

The puerperal death rate for the Borough of Brooklyn, calculated in the same way and stand ardized for color on the basis of the proportion of white and colored in the entire city, was 120, which is slightly better than the 12.2 rate of 1944 The total number of live births in Brooklyn was 50 774, the largest number in any borough, and the number of reported terminated pregnancies was 54 393 The colored rate in Brooklyn, how ever, was 25 9, or nearly two and one-half times the white rate This differential is illustrated in Fig 3

The puerperal death rate for Brooklyn was the lowest of the five boroughs of the city, as it was in 1944

Since stimulation of borough consciousness in a great city like New York may be a factor in reduction of its puerperal death rate the rates of all five boroughs are graphically presented in Fig 4

Presented at a regular meeting of the Brooklyn Gynecolo-gical Bosisty May 3, 1946

Total		67	62
Reported t	erminated preg		
nancies	3	54 393	51 082
Rate		12 0	12 2

In 1945, 67 deaths in Brooklyn were assigned to puerperal causes by the Bureau of Records and Statistics of the Department of Health of the City of New York, 7 other cases associated with pregnancy were assigned primarily to other than puerperal causes — The causes of death are listed in Table 1 above — They may be compared with the causes of death in 1944

Nonpuerperal Deaths

It is necessary to examine the seven deaths of pregnant women assigned to nonpuerperal causes. In 4 cases death was attributed to chronic nephritis, and to cardiac disease in the other 3. In 2 cases of nephritis, cesarean section was performed at about the sixth month, both women dying of uremia. In another case in which no evidence of nephritis could be found, death was due to profuse postpartum hemorrhage. Brief reports of two cardiac deaths are of interest.

Case 1—A primipara with rheumatic heart disease decompensated in the second month of pregnancy, and was put to bed by her physician Severe cardiac failure occurred in the sixth month, when she aborted and died at home unattended

Case 2—A primigravida, two weeks from term, who had attended a clinic regularly for prenatal care, fell on the street and died in an ambulance At the hospital, a living fetus which died one hour later was delivered by postmortem cesarean section At autopsy a ruptured aortic aneurysm was found

Deaths Early in Pregnancy

In this group of 13 cases, 11 were assigned to abortion and 2 to ectopic gestation. Hemorrhage and shock caused death in 2 cases of early spontaneous abortion, and in 2 other cases of abortion hemorrhage was profuse, though death eventually resulted from infection. The 2 cases of death due to ectopic pregnancy deserve brief report of the essential data

Case 3—A primigravida in the twelfth week of pregnancey consulted a physician for abdominal pain. Two days later, the pain became more severe and she was examined by him at home. Several hours later, when called again to her home, the physician found her dead. At autopsy the abdo-

men was found to be filled with blood from a ruptured cornual pregnancy

Case 4—A primipara with rheumatic heart disease was admitted to the hospital in shock. At operation for ruptured tubal pregnancy, 500 cc of blood were administered, and she received another 500 cc two days later Quoting from the case report, "At no time after admission to the hospital did her red cell count exceed one million"

Infection

It is commonly stated that the principal causes of puerperal death are infection, tovemia, and hemorrhage, in the order named, yet our experience over a ten-year period has been consistently otherwise. Officially, 17 cases are assigned to infection, which is always the largest group statistically, but 2 cases of eclampsia and 4 cases of rupture of the uterus are included in this number. According to statistical practice, eight deaths said to have been due to embolism are also included, in three of these, embolism occurred promptly after delivery. One woman who died of uremia and cerebral embolism had been delivered more than six months previously

Toxemia

There were 5 cases officially assigned to tovemia However, 4 additional cases were found in which death was due to spinal anesthesia (1 case), rupture of the uterus (1 case) and infection (2 cases) There were 2 cases of cesarean section in this group and 2 cases of severe hemorrhage Two cases deserve mention of the essential clinical data

Case 5—A primipara was admitted to the hospital in the thirty-sixth week of pregnancy Blood pressure was 138/90 and edema of the face and hands, headache, marked albuminuria, and epigastric pain were present. Five days later she vomited and complained of severe pain in the epigastrium. The next day she was found dead in bed. Death was attributed to thrombosis of the vena cava.

Case 6—A primipara with pre-eclampsia was admitted to the hospital Since the cervix was effaced and the vertex engaged, labor was induced. After thirty-six hours of poor labor, her blood pressure rose to 185/90, and she was delivered by Dührrsen's incision and axis-traction forceps under ether anesthesia

Hemorrhage

Hemorrhage has consistently been the most frequent cause of maternal death in Brooklyn Our experience in 1945 has been no different Statisticians assigned 13 deaths to this cause, but on review of the case reports hemorrhage was found to be a critical factor in 27 cases without inclusion of one death in the nonpuerperal group directly due to postpartum bleeding. In every case hemorrhage was profuse. It is not con-

TABLE 2.—HEMORRHAGE AS A CRITICAL FACTOR IN MA

tended, however, that hemorrhage was the primary cause of death in every instance for several causes were often present. Women in pregnancy and childbirth do not often die of one cause only Table 2 will indicate the statistical change

Hemorrhage occurred with abortion (4 cases) placenta previa (2 cases), abruptio placentae (4 cases), ectopic gestation (2 cases), postpartum (10 cases), and rupture of the uterus or vagina (5 cases)

The first maternal death in 1945 was due to spinal anesthesia. On the next four certificates of death received by the Committee on Maternal Welfare, postpartum hemorrhage appeared as the cause. In all there were 10 cases of postpartum hemorrhage, in 3 of which the placenta was retained. Report of these 3 cases will suffice for this group

Case 7.—A multipara with sovere anemia was delivered spontaneously. Hemorrhage continued for more than two hours before the placents was removed manually 1 500 oc of plasma were administered. Two hours later also received 500 cc. of blood, and five hours later a similar transfusion. Death occurred in shock twelve hours postpartum.

Case 8—A multipara, after expression of the placenta, bled profusely, and shock followed. Vaginal packing appeared to control the hemorrhage. Three hours later the pack was withdrawn and a large fragment of adherent placenta was removed manually, shock was profound 250 co of plasma were administered at this time Death occurred one hour later

Case 9 — A primipara was delivered by low forceps under ether anesthesia after eight hours of labor Bleeding actively she was returned to bed where she expelled large clots of blood over a period of two hours. Plasma and intravenous glucose were administered and finally the vagina was packed. Shortly before death, out-downs for another infusion were unsuccessful. Death occurred four hours after delivery No blood was transfused nor was the uterus explored.

Placenta Previa

I have assigned 2 cases of placenta previa to the hemorrhage group, although 1 patient died shortly after administration of a spinal anesthetic for cesarean section. The other case will be of interest to those who are willing to procrastinate

Case 10—A multipare at term was admitted to the hospital six weeks after an episode of painless bleeding at home Vaginal bleeding recurred shortly after admission. Morphine and plasma were administered, but shock ensued and she died undelivered two hours later Central placenta provia was found at autosey

Abruptio Placentae

In 4 cases death was due to abruptio placentae. The essential data of one case follows

Case 11 —A primipara in the thrty-sixth week of pregnancy was admitted to the hospital after severe hemorrhage at home. She was given 500 cc of plasma, and cesarean section was performed. On the next day plasma was again administered and 500 cc. of blood were transfused later. Death on the tenth day was due to anuna.

Rupture of the Uterus and Vagina

There were 5 cases of rupture of the uterus, although in one of these cases, perhaps, the vagina only was torn. It is curious that but one of these cases was officially assigned to hemorrhage Case reports of 4 of these deaths are on file, the other death is known to have followed version.

Case 18—A multipara with diabetes and large fetus delivered the fetal head without anesthesia after eight hours of labor Great difficulty was encountered with delivery of the shoulders under general anesthesia. Vaginal bleeding was considerable, so the placents was removed manually At this time a laceration of the vagina well into the broad ligament was found. Blood was transfused, but she died in shock twelve hours later

Case 13.—In a multipare with a transverse presentation, the cord and fetal hand prolapsed into the vagina after one hour of labor. Reposition was effected, the vertex crowded over the inlet, and a binder applied. Plasma was administered and pituitrin in minim doses given. Since sharp vaginal bleeding occurred with each contraction, vaginal examination was performed and the placents was now found over the cervical os. Version was carried out, and the patients was given her third infusion of plasma. Twelve successive minim doses of pituntrin falled to stimulate uterine contractions. She died four days later undelivered. At autopsy a laceration 13 cm. in length was found in the uterus, 3,500 cc. of blood were in the peritoneal cavity

Case 14—A multipara, gravida 8, para 7 had short, sharp labor and pain ceased Diagnosus was missed for several hours, but finally made. Hysterectomy under local anesthesis took but twenty two minutes to perform, 3 500 cc of blood were found in the peritoneal cavity In all 1,200 cc. of blood were administered, but death occurred in shock twelve hours later

Case 15 —A multipara gravida 7 para 6 after good labor for twelve hours had a convulsion Another convulsion occurred nine hours later, pain ceased and shock followed. Plasma was given. Manual rotation was attempted, and a laceration in the wall of the uterus was discovered. Death occurred after another convulsion. At autopsy, 1,600 cc of blood were found in the peritoneal cavity, and a rupture in the uterine wall through which the fetal head and arm protruded.

Anesthesia

For discovery of controllable factors the bare table of statistics is not very helpful. Anesthesia, for instance, does not appear as a cause of death. Even though the certificate of death states that death was due to the anesthetic itself, or to asphyua following aspiration of vomitus or to atelectasis, the statistician assigns death to one of the major puerperal causes, often to accidents or other and unspecified conditions of childbirth

After administration of caudal anesthesia, two deaths occurred, one attributed to cerebral embolism, and the other to rheumatic heart disease

In 4 cases death was associated with administration of a spinal anesthetic for cesarean section, in 2 of these cases, death occurred before operation could be performed, in another case massive pulmonary collapse followed operation, in the fourth case, cyanosis, harsh unproductive cough and widespread rales point to atelectasis as the cause of death

There were three deaths directly due to aspiration of vomitus during administration of general anesthesia

Cesarean Section

Cesarean section was associated with death in 16 of the 67 puerperal deaths Two deaths in the nonpuerperal group are not included in the tabulation of the causes of death (Table 3)

Two of these cases are briefly reported

Case 18—This patient had two previous cesarean sections. Operation was under gas-oxygen-ether sequence, at the onset of labor. Two hours later profuse hemorrhage occurred. Plasma and ergotrate were administered, and the fundus of the uterus massaged, but bleeding continued and shock followed. The vagina was packed, and 1,500 cc of plasma were given before death. The uterus was not explored, nor was blood transfused.

Case 17—A multipara with blood pressure 210/110, albuminum retinitis, and anuma was admitted to the hospital Shortly afterward, she bled profusely and had a convulsion Classic cesarean section was followed by death one hour later

Cardiac Disease

Search for rheumatic heart disease as a controllable factor is quite satisfactory, as it is usually mentioned and tabulated either as a primary or a secondary cause of death. Puerperal

*** 2 cases not included (nonpuerperal)

death statistics for coronary disease and myocarditis are not reliable. Cardiac disease was a factor in 13 cases. In 3 additional cases death due to cardiac disease was assigned to nonpuerperal causes.

In 4 cases of cesarean section death was due to cardiac disease In one of these cases, however, the indication for operation was not cardiac but disproportion, this patient had been admitted to the hospital in failure and operated upon one hour later. In the other 3 cases the indication for operation was cardiac disease. Brief report of 2 cases follows.

Case 18—A primipara, who had been hospitalized twice during the antepartum period, died two days after classic cesarean section performed one week before the calculated date of delivery

Case 19—A primipara, who had been under joint observation of an obstetrician and an internist, was decompensated during the last six months of pregnancy—Death occurred shortly after lower segment cesarean section and sterilization under fractional spinal anesthesia

Detailed report of other cases is not practicable, nor is tabulation, since it is difficult to summarize the details of antepartum course and management. Labor, even though early in pregnancy, is formidable if heart disease is not compensated. In the few cases late in pregnancy in which delivery was allowed to occur spontaneously, labor was so short that there was no time for forceps delivery, or it seemed unnecessary. The fault was largely found in antepartum management of cardiac disease, even though the obstetrician invited an internist to share responsibility with him

In many cases neither patient nor physician appreciated the gravity of delicately balanced compensation. One patient with mitral stenosis, under joint care of obstetrician and cardiologist throughout her entire antepartum period, was said never to have decompensated, yet shortly after admission to the hospital in the thirty-seventh week of pregnancy she was delivered spontaneously of a macerated fetus and died a few hours later in cardiac failure.

From study of the case reports it seems that the controllable factors may best be stated by generalization Women were admitted to the

hospital in labor in varying stages of pregnancy and failure with and without antepartium care at home. Others attended the physician's office regularly, taking small doses of digitallis in the later months. It was common for patients to be treated at home after decompensation had occurred, only to be admitted to the hospital and discharged 'inter for home treatment. Women were admitted to the hospital for a rest period of two weeks, only to fall into labor shortly after admission. Cesarean section before term is more dancerous than if performed later.

Controllable Factors

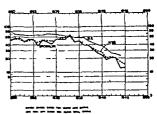

The controllable factors of maternal mortality in Brooklyn are concerned principally with abortion, anesthesia, cesarean section heart disease nephritis, and hemorrhage. Abortion is a social and economic problem, yet its correlations with hemorrhage, cardiac disease and nephritis invite our attention. The hazards of anesthesia will be minimized when hospitals see the necessity of departments of anesthesiology, under competent direction and well staffed

Deaths associated with cesarean section in a ratio of one to every four or five puerpent deaths have been our lot for several years. Their indications need close examination. The importance of cardiac disease as a considerable increment of maternal mortality, grown more obvious. If appears that women who have broken compensation no matter how early in pregnancy should remain in the hospital until safely delivered. It is likely that cesarean section should not be performed at all for cardiac disease.

From these case reports it is apparent that many women do not receive blood when they should And often it is given too late and in pltifully small amounts. Plasma is but a substitute for blood, and a poor one if hemorrhage has been severe. In these cases nothing but blood will do. And it should be obvious that even large amounts of blood will not save life if hemorrhage is allowed to continue. Hemorrhage has long been the principal cause of death in Brooklyn, and the red tide is not ebbing

I believe that homorrhage is the most important cause of maternal death, not only in Brooklyn but in the United States This view has not as yet been widely accepted, yet Brooklyn is a large urban center, where the maternal mortality

PUERPERAL MORTALITY UNITE STATE, CITY OF NEW YORK, AND BONDOON OF BROOKERS

Fro

rate over a long period of time, has closely paral leled the rate of New York City and the United States (Fig. 5)

To discover and name the controllable factors of death is more constructive than publication of vital statistics or a bland statement of their percentage of preventability. Only when the meager data on the certificates of death are amplified by case reports can we discover why women die in childburth and what may be done about it. At no time during the past ten years could this have been done without the cooperation of the Commissioner of Health of the City of New York, the obstetricians who report the circumstances of death, and the Visiting Nurse Association of Brooklyn which provides physicians with capable secretarial help

Unless interest is maintained, any considerable further reduction in the puerperal death rate of Brooklyn will be unlikely As the total number of deaths shrinks, individual interest must grow Now, more than ever, every one who practices obstetrics must realize that he himself can make a personal contribution to prevention of death The obstetrician has an additional obligation. No matter who he is or where or how he practices, he should be aware of the situation in his community, and take an active part in the cru sade for reduction of the puerperal death rate. Responsibility cannot be delegated to public health administrators who have for their inspiration only the certificates of death, which are valuable, indeed, but completely inadequate for a comprehensive local program

PSYCHIATRIC PERSONNEL PLACEMENT SERVICE

The activities of the Psychiatric Personnel Placement Service jointly operated for the past year as an emergency placement program by the American Psychiatric Association and The National Committee for Mental Hygiene have been taken over by the

National Committee for Mental Hygiene, 1790 Broadway, New York 19 New York. Applications from physicians seeking placement in positions or in training in the field of psychiatry are still invited

CLINICAL USE OF PENICILLIN IN OTOLARYNGOLOGY

J WINSTON FOWLKES, M D., New York City

PENICILLIN is such a commonly discussed subject and the literature is so voluminous that one hesitates to generalize. It is only by comparison, though, that we will be of help to each other in using this drug in treating the usual run of ear, nose, and throat cases

In considering the use of this drug one should consider its qualities as compared with drugs of a different nature

Chemistry and Action

This drug is an organic acid made from a mold -penicilliam notatum-which reacts chemically Although the sodium to form salts and esters and calcium salts are generally used they are relatively unstable and must be kept in a refrigerator in order to maintain their potency Recently. the Commercial Solvents Company has been able to produce almost chemically pure penicillin in crystalline form This may be used in very high concentrations and does not have to be refrigerated It is thought that the formula of penicillin is $C_{14}H_{19}NO_6$, or $C_{14}H_{17}NO_5+H_2$, but the exact chemical formula is not as yet known Therefore, a synthetic preparation has not been produced

It has been well established that penicillin exerts a bacteriocidal action on certain bacteria when used in sufficient concentration. This action is much quicker than that of the sulfonamides as there is no lag phase and it does not depend on the development of antibodies and phagocytes. There is also an element of fastness to certain bacteria which must be kept in mind.

Penicillin is very selective in its action in that it is more effective on the anaerobic and aerobic gram-positive bacteria than on the gram-nega-We are indeed fortunate in that the former group is more often responsible for the diseases we are called upon to treat satisfactory results are not obtained, it is probably due to the presence of a mixed infection of nonsensitive organisms which inhibit the action of penicillin through the formation of an enzyme which has been given the name of penicillinase These organisms are the nonspore forming gramnegative rods such as proteus and pyocyaneus Of many agents used, parachlorophenol was found to be the best to eliminate these organisms 2

It is interesting to note that the more fulmi-

Presented at the 140th Annual Meeting of the Medical Society of the State of New York Section on Ophthalmology and Otolaryngology, May 3, 1946 nating the disease the more striking the effect of penicillin. This is probably due to the fact that penicillin acts more promptly and with more force on fresh cultures when the bacteria are dividing more rapidly. In reference to cases in which the disease has reached a chronic state and is of more or less a minor character, we are often asked, "Why not use penicillin?" The above explanation is the answer

Another important feature is that the action of penicillin is exerted on the bacteria in the tissues without causing any destruction to the cells of the host. This is in contrast to chemical antiseptics which act as a protoplasmic poison. Its action is also effective in the presence of pus formation, whereas in the sulfonamides they are not effective in the presence of pure pus formation.

Administration and Dosage

Almost every conceivable way of administering any kind of drug has been tried in the use of penicillin. Since the drug has to come in contact with the infected area to produce results, different methods should be employed, depending on the case at hand

The inhalation method has been used with some success in asthmatic cases. The results obtained in this method are somewhat transitory and it is only effective while the drug is being used. Local application in infected wounds, such as mastoid cavities, have produced excellent results. In our experience, instillation in nasal sinuses has not produced the desired effect.

Since the drug is not found in large quantities in the meninges when given into the blood stream, a more effective method has been sought has been found that in cases of meningitis the intrathecal and spinal injections have produced One dose a day of 3,000,000 or excellent results 400,000 units has been found to produce ade-It has also been given by mouth, quate results but when given by mouth, to obtain an adequate amount in the blood stream, the dose should be five times as great as that required by the intramuscular method The intramuscular or intravenous methods of administration are more commonly used at the present time, although it has been found that the intravenous method has no particular advantages since the drug is absorbed so rapidly by the intramuscular method, and, in the average case, ways and means have been devised to slow down its absorption in order that its effect may be more lasting

Since it is well known that some bacteria develop a resistant state to penicillin, the dose should be large enough in the beginning to obtain the desired effect before an opportunity is afforded for the bacteria to become penicillin fast.3

The size of the dose depends on the num ber of units required to produce lysis in the blood

serum of the individual patient. In infections in which the organism is suscept-

ible, intramuscular injections at three-hour intervals is adequate to get the blood to a required concentration. In regard to the dosage, it should vary according to the type of organism with which we are dealing Some organisms require a much larger dose than others. Also, the dose should be relatively large when there is a mixed infection. Some organisms may be killed in a matter of hours whereas others may require many days. This has been demonstrated in the case of streptococci which respond very quickly whereas the staphylococci is usually much more resistant.

When an operation is imminent, I have felt it is very much safer, whenever possible, to give 20,-000 units every three hours for twenty four hours before operation and to continue postoperatively until the patient is definitely out of danger The postoperative course is much less hazardous and the convalescence is greatly reduced.

Absorption, Excretion, and Distribution in the Body

Penicillus, when administered intramuscu larly, is absorbed very rapidly into the blood stream but remains in the blood stream and tissues a very short time. Eighty per cent of a given dose is excreted by the kidneys in two hours, and at the end of four hours only 5 per cent is left in the body tissues.

It has been shown that its rapid elimination is brought about by the fact that it is excreted by both the glomeruli and the renal tubules. To slow down its absorption, it has been mixed with beeswax and peanut oil, also by the use of an ice

bag over the injected area.

When excreted by the kidneys it may be recovered in its original form showing that it has not been broken down by the body fluids although it is inactivated by the gastric juice and the bacterial flora of the large intestine. Penicilin has never been recovered in large quantities from the spinal fluid, tears, or saliva This demonstrates the fact that it is somewhat selective in its distri

Since it is distributed by the blood stream, it is more active in very vascular areas, whereas in bone it is relatively slow in producing changes.

Toxicity as Compared with the Sulfa Therapy

Penicillin as compared to the sulfonamides is much less toxic. When the drug is pure and the salt or dextrose solutions used are pyrogen free, no serious effects have been noted, and in the small per cent of patients that did show any toric effect, these effects were transitory and not severs, all disappearing shortly after the drug was discontinued.

The toxic effects that have been reported are flushing of the face, tingling of the testicles, headache, urticaria, arthralgia, fever, sore throat, and enlarged lymph glands and spleon

Our patients at St. Luke's Hospital have been unusually free of these complications as only a

few of them have been noted

In the case of the sulfonamides, a much more serious complication may develop such as the crystallization of the sulfa in the kidneys and very high temperatures with a chill This is often confusing

It is important to bear in mind these various toxic effects since it has been considered advantageous in some cases to use both the penicillin and the sulfonamides at the same time However, the dual use of these drugs is only justified in desperately ill patients when time has not elapsed to determine the type of infection and the reaction of the bacteria to penicullin.

Time will increase our keenness in evaluating the toxic effects and in familiarizing ourselves with the common reactions and the behavior of the pa tients

Types of Infection, Clinical Behavior, Pathologic Findings, and Reports of Cases

Infections of the lungs, both acute and chronic, have been greatly benefited by the use of penicil-This is particularly of interest, from our point of view, in considering cases of lung abscesses and bronchiectasis when chest surgery is anticipated. Throat infections, such as tonsilli tis, peritonsillar abacess, Ludwig's angina. cervi cal adenitis, and edema of the larynx from acute infections, have responded to penicillin more favorably than to any other type of therapy

In acute cases of sinus infection, it has been of inestimable value when intramuscular injections are used in conjunction with other ordinary methods of treatment but in chronic cases the results have been very unsatisfactory I have not been able to obtain satisfactory results with the local use of penicillin instilled into the sinus cavities, either in acute or chronic cases. The chronic cases even with penicillin require operative interference to effect a cure. In operative cases, the postoperative course has been much smoother and the convalescence greatly reduced by the administration of 20,000 to 30,000 units intramuscularly every three hours

Dr Robert Priest reports that after treating many cases of chronic sinusitis with an indwelling catheter inserted into the sinus and irrigating the sinus every four hours with a solution of penicillin, he concluded that this method had to be abandoned and he had to resort to surgery since there were so many recurrences in a short time after these treatments were discontinued ⁴

In infections of the ear, many conflicting reports have been given. In my mind it is very questionable whether or not the administration of penicillin is of any great value when several days have elapsed since the onset of acute otitis media, whereas, if penicillin is administered a few hours after the onset, I am convinced the results will be striking and exceedingly satisfactory

In evaluating the signs and symptoms of middle ear and mastoid disease after the administration of penicillin, the picture presented is entirely different from that which was found before the use of this drug came into existence The signs and symptoms, as regards their severity, are very much reduced, and mastoid involvement is often overlooked Even the x-ray pictures are sometimes confusing and normal reactions to infection may be absent It is only with the closest observation that one is able to determine in some cases whether or not operative interference is advisable The pathologic material found in the mastoid presents a different character in appearance, in that it is much paler and the granulations take on a much more fibrous quality There may be marked destruction of bone with very little inflammatory reaction in the surrounding parts In some cases the dura of the middle fossae may be exposed by disease and I have found the lateral sinus completely blocked by an organized clot without any clinical picture of circulatory involvement

Space will not permit the complete case histories and x-rays which were presented at the reading of this article. The following are the different types of cases that were studied.

Case 1 Pneumococcus Type III Mastoidius—
The important feature to bring out in this case is
that this patient did not respond to penicillin when
first given. It produced an unexplained fever
Penicillin was discontinued for a few days and the
temperature returned to normal. After several days
another brand of penicillin was given which the patient tolerated very well. The discharge ceased and
the patient promptly recovered.

Case 2 Fronto-ethmoid Sinusitis —In this case there was a large collection of pus in the frontal area The patient refused operation Penicillin was administered intramuscularly for nine days after which the patient gave her consent for operation A bilateral Killian operation was done immediately and the patient made a quick, uneventful recovery She was maintained on penicillin for seventeen days postoperatively and the wound remained unusually clean. Although the patient refused operation in the beginning, the preoperative administration of penicillin, I believe, stood her in good stead. X-ray plates showed marked breaking down of both frontal sinuses.

Case 3 Ludwig's Angina—This was a dangerously ill patient After incision and drainage, with the administration of penicillin, he recovered in about one half the time usually required in this type of case before penicillin was available

Case 4 Chronic Maxillary Sinusitis (Bilateral) with Asthma—A double Caldwell-Luc operation was done, penicillin being administered twenty-four hours before operation. Cultures from the nose and from the antra at time of operation showed bacteria which were all penicillin sensitive. Penicillin was continued for ten days postoperatively and there was a marked reduction in the amount of secretion from the nose as compared with other cases. The patient made an uneventful recovery with no return of the asthmatic symptoms for some time after leaving the hospital.

Case 5 Acute Mastoiditis—This case healed completely in fourteen days, penicillin having been administered preoperatively and postoperatively

Case 6 Acute Pansinusitis—X-rays of sinuses revealed pansinusitis, more extensive on the right side. This case did not respond to the ordinary palliative treatments and a Caldwell-Luc operation was done on the right side. This patient received penicillin for three days before operation and for five days after operation. His nose was free of discharge on the third postoperative day.

Case 7 Acute Exacerbation of Chronic Mastoditis—On admission the patient's temperature was 105 6 F There was a large amount of purulent discharge from the right ear and a dead labyrinth on the same side Blood culture revealed a growth of staphylococcus albus A radical mastoidectomy was done and a large cholesteatomatous-like mass was removed from the mastoid cavity. The lateral sinus was opened and plugged off with iodoform gauze. Thirty thousand units of penicillin were administered every three hours for a week. The temperature dropped to 100 F in twenty-four hours and remained down during the convalescence.

Chronic Mastoiditis with Intracranial Complications — The patient had a small amount of discharge from his right ear and all the signs and symptoms of brain abscess on the right side right mastoid was opened and creamy pus and cholesteatomatous debris was found under pressure on entering the antrum There was also necrosis of the dural plate in the middle fossae and a fistula found leading into the temporosphenoid lobe Pus was also evacuated from the brain abscess found coming from the region of the knee of the The sinus was opened and packed lateral sinus Thirty thousand units of with iodoform gauze penicillin was administered every three hours intranuscularly The abscess cavity was irrigated three imes a day with a solution of penicillin, 1 000 units o the cc The wound was clean in several days and he patient was up and around on the thirteenth av

Conclusion

In conclusion, the important points noted are The action of penicillin is quicker than that of the ulfonamides and is less toxic the failure of pen cillin to produce results is probably due to the nhibitory bacteria in mixed infections, pencillin icts more promptly and with more force in acute nfections than in chronic, intramuscular injecion is the choice mode of administration with the exception of cases of moningitis, penicillin fastiess may be prevented by large doses in the beginning of the disease the clinical signs may be masked by penicillin the preoperative use is of real value as well as the postoperative use It does seem that in severe infections, one can predict a good prognosis, the minimum of complica tion, decrease of discomfort, and a marked reduction of the convalescent period with the use of penicillin

WHAT DOES THE MEDICAL SOCIETY OF THE STATE OF NEW YORK DO FOR ITS MEMBERS?

When the time comes for the payment of the annual assessment to the State Society. the above question is asked frequently The Editors of the Journal feel impelled to

make a reply and trust that this will be given due consideration by our members.

Membership above all, is an evidence of ethical standing in the profession. It consti tutes a criterion for admission to the American Medical Association and participation in its annual scientific sessions. It is a prerequisite to admission in most special societies speciality diplomate boards, and hospital stalls. Through its House of Delegates, a democratic basis is established in the development of policies and in the choice of these

delegates every member has a voice in his county society

Membership includes a subscription to the New York State Journal of Medicine issued twice monthly, and to a copy of the Directory. The latter is one of the most complete records of its kind the monetary value of which, if purchased separately would exceed actually the amount of the customary assessment.

Membership constitutes eligibility for free legal defense and group professional liability insurance. It provides advisory service from various established bureaus, including Workmen's Compensation, Veterans Administration, etc representation in legislative matters, and enforcement of the Medical Practice Act

Membership supports the work of a variety of committees on public health and post graduate education publicity public relations, and others

Membership supports the Headquarters Office of the Society in New York City with its numerous and important activities and the Legislative Bureau in Albany

The foregoing is a review of the important activities which through dues contribu-tions your State Society manages and supports. The recital should furnish evidence to thous your outer execution manages and supports. The rectangle and approximately administrated through the administrative staff. Members are urged to take advantage of their opportunities. From time to time the JOURNAL will publish more detailed information about these various activities

NAGEMENT OF RENAL LITHIASIS

RLES C HIGGINS, M D, Cleveland, Ohio*

m the Cleveland Clinic, Cleveland, Ohio)

RECENT years pronounced progress has een made in the management of renal lithi-

This advance has been accomplished to a extent by eradication of the causative facassociated with calculus formation, during iperative procedure or in the extended period istoperative care

order that such contributing factors may be nated, intensive preoperative investigation sential

sative Factors

te following causative factors which may be nated with stone formation require thorough

Vitamin A Deficiency—In view of experial and clinical observations, a routine bioometer test should be made in all patients renal lithiasis. As reported previously, 60 5 per cent of our patients demonstrated a ive test for vitamin A deficiency. Even gh the test is normal, vitamin A should be nistered in large doses postoperatively for its fic effect on epithelial structures.

Focal Infection—In view of the experial work of Rosenow and Meisser² foci of tion in the teeth, tonsils, cervix, and prostate d be removed

Infection of the Urinary Tract—The reship between infection and stone formation een presented by Braasch, Bugbee, Chute, others Bugbee in 19324 made a clinical to ascertain the relationship between a preng pyelonephritis and calculus formation finite history of pyelonephritis was elicited of 29 patients with renal calculi

neberg in 1935⁵ discussed the importance of obic organisms in the genesis of calculiul classification of the offending organism is tial. In each case the urea-splitting power e organism should be determined. Urea is into ammonia and carbon dioxide with the ant formation of ammonium carbonate combines with the magnesium salts and phates to form ammonium magnesium phose, which is insoluble, and by rendering the ion of the urine alkaline, results in the pretion of the equally earthy phosphates easplitting infections of the kidney occur

sented by invitation, at the 140th Annual Meeting of edical Society of the State of New York, Section on y, May 2, 1946

more frequently than we have been led to believe from a review of the literature Brown and Earlam⁷ state that 18 per cent of the bacilli and 40 per cent of the Staphylococcus albus that infect the urinary tract have the property of splitting urea

Chute and Suby in 1940, in reviewing 90 cases of urinary calculi, noted infection present in 75 per cent. In 27 per cent the urine was sterile at the time the patients were first found to have calculi. Urea-splitting bacteria composed 54 per cent of the total cases of stone and 74 per cent of all infected cases. Therefore, in addition to the usual gram stain of the sediment and cultures urea-splitting property of the organism should be determined.

4 Hyperparathyroidism—Barney and Mintz, Albright and Bloomberg, and others have stressed the relationship between hyperparathyroidism and renal lithiasis. In 1931 Barney and Mintz cited a series of cases in which a diagnosis of hyperparathyroidism had been confirmed by surgical intervention. In 11 cases, or 61 1 per cent, calculi were observed in the urinary tract. The renal calculi were bilateral in 4, or 36 per cent, of the 11 cases. They concluded that hyperparathyroidism is responsible for from 4 to 5 per cent of the cases of renal lithiasis.

Graffin, Osterberg, and Braasch, ¹⁰ in reviewing the cases of urinary calculi at the Mayo Clinic, found hyperparathyroidism was a causative factor in less than 0.2 per cent of the cases. At Cleveland Clinic I have found hyperparathyroidism to be associated with renal lithiasis in approximately 0.1 per cent of the cases.

Routinely, however, we should secure studies of the blood calcium and phosphorus. If there is an elevation of the serum calcium and a lowering of the serum phosphorus, attention is attracted to the possibility of hyperparathyroidism. In such instances further roentgen studies of the bones and investigation of the amount of calcium being excreted in the urine should be made.

5 Calcium Excretion in the Urine—A study of the excretion of calcium in the urine should be made in each case. On a normal diet approximately 200 mg of calcium is excreted in the urine daily. As has been discussed so excellently by Flocks, 11 the excretion of calcium in the urine can be altered by (1) varying the intake of calcium and phosphorus in the diet, (2) varying the

acidity of the ash in the diet, and (3) varying the vitamin D intake

Flocks further demonstrated that upon a diet low in calcium and phosphorus and with a neutral ash, the daily average urmary output is less than 90 to 150 mg of calcium per twenty four hours On a diet containing large amounts of calcium and phosphorus with a neutral ash the urmary calcium may rise to 800 mg daily. It is well known that the acid ash diet may increase the urmary calcium and also the solubility of the calcium saits being excreted in the urme. In normal individuals, and with a wide variation in the diet, the quantitative excretion of calcium in the urme is relatively small.

Flocks has observed that many patients who have or have had urinary calcult show a high urinary calcium excretion while the blood calcium and phosphorus levels are normal. The exact cause of this increased excretion of calcium in this group of patients is unknown. In Flocks' series these individuals comprise 60 per cent of patients.

with calcium atones

Thirty-five to 50 per cent of patients show a

normal or low unnary calcium.

I believe the study of calcium exerction in the near the postoperatively is of paramount importance. If the acid ash diet causes a pronounced elevation in the calcium excretion which is not overcome by its increase in solubility, the diet should be discontinued Study of the type of crystals being exercted is therefore essential

- 6 Gout.—This is a metabolic disease in which an elevation of the blood une acid occurs and may be accompanied by excessive preenptation of urates and unce acid in the urine. Normally, man excretes 0.3 Gm to 1.2 Gm, of une acid daily, the amount being influenced by the diet. Uricacid calculi may not east a shadow on the initial roentgenogram, and the possibility of a non-opaque stone composed of uric acid in a patient having the clinical picture of renal colle must be considered. An elevation of the blood uric acid and une acid crystals in the urine focuses attention on this possibility
- 7 Cystinuria.—This is a familial disease stated to be caused by derangement in the intermediate protein metabolism. Normally, cystine is oxidized completely, and the sulfur is excreted as sulfate. Seeger and Kearns¹³ in 1925 collected 181 cases of cystinuria, 124 of which were complicated by calculus disease. Renal calculi are frequently observed in more than one member of the family Chemical tests for cystine and microscopic study of the urinary sediment for cystine crystals confirm the diagnosis
- 8 Oxaluria.—In this condition abnormal amounts of oxalic acid are excreted in the urine. Approximately 12 to 30 mg of oxalic acid which

has both exogenous and endogenous sources is excreted in the urine daily. Again search for oxalate crystals in the urinary sediment is of importance.

9 Xanthinuria.—Xanthine calculi are rarely observed. Kretschmer¹⁴ in 1934 collected a series of 15 cases and later added an additional case Mathewa¹⁴ has stated that unc acid is the most important purne in the unne but that 30 to 50 mg of purne bases, vanthine, hypoxanthine, quanine and adenine are also present

The role of diet in preventing such calcult is obvious

- 10 Phosphaturia —Three types of phosphaturia may be present and classified in each case.
 - Temporary phosphatura produced by
 - (a) medication
 - (b) overabundance of foods with an excess alkaline ash
 - 2 Permanent infected phosphaturia due to the presence of uren-splitting organisms
 - Fermanent noninfected phosphatuma of unknown cause (alteration in function of gastrointestinal tract)
- 11 Urnary Stass.—Urnary stass in some instances seems definitely associated with stone formation. It is conducive to shifting the hydrogen ion concentration of the urne to the alkaline side and furnishes an excellent habitat for bacterial growth. Therefore, an intravenous urogram should be secured prior to operation in order that procedures may be utilized to eliminate stass.

It appears that there is no single cuologic factor responsible for the production of all renal calculi Only a comprehensive preoperative investigation of the enumerated causative factors with their correction can minimuse the incidence of recurrent calculus formation

Operation

In recent years refinements in the technic of renal surgery and the introduction of the newer chemotherapoutic agents have permitted conservative treatment. Kidneys which might have been sacrificed in past years due to coexisting in fection which could not be cradicated can now be satisfactorily treated by the newer drugs

Extensive nephrotomies for the removal of stag-horn calculi can now be safely advocated

The majority of calculi can be removed by one of the pyelolithotomy technics

After removal of the calculi in the absence of pronounced infection the incision in the pelvis should be closed, as prolonged dramage is con ducive to Staphylococcus albus infection regardless of extreme care in dressing the wound

During the last few years several reports advocating calicectomy have appeared in the litera-

I believe this to be too radical a procedure for uncomplicated renal calculi In the presence of a pyocalix, however, such a procedure may be With modern procedures calicecadvised tomy is not required to prevent recurrent renal calculi formation in the majority of cases

Heminephrectomy under certain conditions may be advocated to spare the remaining portion In instances in which the kidney of the kidney has two pelves, either with a bifurcated ureter, or double ureters, or when one segment of the kidney is irreparably injured, heminephrectomy may be the procedure of choice

When a nephrolithotomy is advocated it should be as conservative as possible In 1939 we at Cleveland Clinic demonstrated in the experimental laboratory that immediate bleeding is less and that less infection and atrophy of the renal parenchyma are produced when the incision in the parenchyma is made with a cutting current

Postoperative Management—An initial roentgenogram and an intravenous urogram should be secured before the patient leaves the hospital This will reveal any retained fragments of calculi which may have been overlooked and for which immediate treatment is necessary to attempt dissolution It will also reveal the presence or absence of stasis, which, if present, demands prompt treatment

A roentgenogram should be secured every three months for the first year after operation when postoperative procedures consist of

- Maintenance of large fluid intake and
- 2 Eradication of infection in the urinary
- 3 Elimination of stasis
- 4 Treatment with vitamins A and B
- 5 High vitamin A acid ash diet (a) Carbonate and phosphatic calculi
- High vitamin A alkaline ash diet
 - (a) Cystine stones (b) Xanthine stones
- 7 High vitamin A low ovalate diet
 - (a) Ovalate stones

- High vitamin A low purine diet (alkaline ash)
 - (a) Uric acid stones

CHARLES C HIGGINS

- Hydrogen ion concentration of the urine is checked daily by the patient, with the LaMotte pH apparatus, and presented to the physician for review at monthly intervals, the pH of the urine being controlled by diet
- 10 Eradication of foci of infection
- Postoperative check of the calcium being 11 excreted in the twenty-four-hour specimen of urine after the dietary routine has been instituted

Unless strict management following operation is maintained, the incidence of recurrent stones cannot be minimized

By dietary management and the use of newer chemotherapeutic agents in conjunction with other procedures employed in the past, we have reduced the incidence of recurrent renal lithiasis in our cases from 164 per cent to 49 per cent With the introduction of newer drugs further to eradicate resistant organisms we are hopeful of even better results

ANNUAL MEETING

Buffalo Memorial Auditorium and Convention Hall May 5-May 9, 1947

HE House of Delegates meets May 5, 6, and 7 Scientific exhibits will be open L Tuesday through Friday Postgraduate lectures will be held all day Tuesday Wednesday through Friday, Section Meetings and General Sessions will be held (See Page 591 this issue for list of hotels) Hotel reservations should be made at once

PARENTERAL NITROGEN THERAPY IN SURGICAL NUTRITION INCLUDING THE USE OF A MIXTURE OF PURE AMINO ACIDS

SIDNEY C WERNER, M.D. New York City

(From the Department of Medicine, Columbia University, College of Physicians and Surgeons and the Presbyterian Hospital)

THE war, with its emphasis on the effects of trauma, greatly stimulated interest in the field of protein nutrition, since a major effect of trauma is to precipitate negative nitrogen balance on a nitrogen intake previously adequate to maintain equilibrium. In other words, one of the results of injury is to raise the requirement for introgen at a time when the natural inclination is to reduce intake because of poor appetite. This paper deals with the management of the problem of parenteral administration of introgen when oral therapy is not possible. The limitations of this type of therapy will be considered.

The indications for parenteral therapy appear to be twofold first, when intake by mouth is inadequate or is refused and, second when there is obstruction or deranged function of the gastrointestinal tract. Thus, inadequate intake may result from anorexia following injuries such as burns severe fractures, various diseases, or from psychogenic factors. Such refusal of food or protein hydrolysates may be overcome by tube feeding. However, this procedure is not always acceptable to the surgeon or to the patient In such a case, parenteral feeding is the only choice Similarly deranged function of the gastrointestinal tract also interferes with therapy by mouth. Recent operations on the stomach or intestines, fistulae between upper and lower intestine, mechanical or functional obstructions to the gastrointestinal tract, as with pylorospasm carcinoma of the exophagus and elsewhere, postoperative dis tention edema of the gastrointestinal tract from hypoproteinemia, and severe diarrhea where absorption is interfered with all may necessitate parenteral feeding to maintain nutrition

It is evident that minimal caloric and nitrogen requirements must be met in parenteral as well as in oral feeding. These needs vary since the body can adapt to chronic malnutrition by reduction in basal metabolic rate and decrease in nitrogen turnover as above by diminished nitrogen excretion in the unne. Also the burning of nitrogen can be lessened by high carbohydrate feeding, the mitrogen sparing effect. However, on the average, about 80 to 90 Gm of protein (12.8 to 44 Gm. of nitrogen) and 1 600 calories appear a desirable minimum for the unniured patient.

After injury the requirement of nitrogen is sharply elevated according to the severity of the injury. The caloric needs also increase as a result of the rise in temperature.

Parenterally these needs can be met by the use of a protein hydrolysate or of a mixture of pure amino acads to provide nitrogen and by dextrose to furnish calories. Fat has been un available for parenteral use except experi The extent of parenteral therapy is lumited by the maximal fluid volume that can be introduced into the circulation in a day, about 3 000 to 4,000 ec on the average, providing the heart and kidneys are normal in their function The use of a hypodermoclysis lessens the immedi ate strain on the circulation from an infusion, but still provides the need of excreting excesses of water after absorption. Obviously, in the presence of cardino disease, cardino failure may result with rise in venous pressure and decreased vital capacity or even pulmonary edema, as with any infusion.

The protein hydrolysate preparations which are available to provide nitrogen have been prepared either by ensymmtic or by acid hydrolysa ocasein or lactalbumin as the most frequently used protein sources, though other proteins have been used. The ensymmtic easein hydrolysate is completely adequate as a mitrogen source, the acid hydrolysates must be fortified with tryptophan to replace the tryptophan destroyed during preparation. In the dog, at least the acid hydrolysate is not restored to the efficiency of the ensyme hydrolysate by this procedure.

Recently, a mixture of the ten essential amino acids and glycine in pure crystalline form has become available, and has been studied clinically. The amino acid mixture is compared with a case in hydrolysate preparation, in Tables 1 and 2, with respect to toxicity and nutritional value.

	·	

Table 2 shows a comparison in nutritional values per given volume of hydrolysate or amino acid mixture

The amino acid solution can be given more This, allows rapidly than casein hydrolysate time for early ambulation, and sleep is not inter-Glucose and salt must be provided with the amino acid mixture, and in view of the danger of acidosis, the addition of one-sixth molar sodium lactate golution able

Α convenient treatment routine consists of an AM and a PM infusion of 1,000 to 1,500 cc 8 per cent amino acid solution, and a hypodermoclysis of 1,500 cc 5 per cent dextrose in saline in the morning, concurrently with the infusion Five hundred cc of one-sixth molar sodium lactate solution can be given intravenously following one of the amino acid infusions The saline provides a vehicle for sulfonamide compounds. penicillin, and vitamins which probably should not be added directly to the amino acid solution About 3 to 4 liters of 5 per cent casein hydrolysate solution are necessary per day to provide similar amounts of nitrogen

Nitrogen balance can be produced by parenteral feeding with the amino acid mixture, except after the more severe injuries when there may be a caloric and nitrogen need greatly in excess of that amount which can be given practically One point is to be emphasized If high nitrogen nutrition is commenced postoperatively, it should be continued without interruption until the daily food nitrogen intake equals the daily parenteral nitrogen administered Otherwise, an excess of nitrogen may be lost in a single day equal to that retained in three or four days of It is possible that the attainment of treatment actual nitrogen balance may not be necessary but rather that the heightened nitrogen turnover that results from even inadequate amounts of nitrogen may be the essential reason for benefit from nitrogen therapy

The author has endeavored to prove whether such therapeutic efforts better the clinical course of the patient A study was made of a series of 25 patients with peptic ulcer, undergoing partial gastrectomy and receiving parenteral amino acid therapy, and of a control series of 52 patients treated identically except for the use of amino It is difficult to draw conclusions since so acida many of the control cases did well without nitrogen therapy However, about one fifth of the controls developed complications such as distention, late vomiting, poorly functioning gastroenterostomy stoma, delayed temperature fall, or mability to eat a full diet, preventing early discharge from the hospital None of the amino acid treated cases had these difficulties. A probable explanation for the good results in the control group is that these patients were not badly undernourished so that they still maintained a protein reserve on which to draw When this reserve is gone, the complications of hypoproteinemia are precipitated by a demand for protein, with ensuing wound disruption, distention, edema of the gut, etc It is in this group, then, that nitrogen therapy is most indicated to prevent nitrogen loss

In conclusion, then, parenteral nitrogen therapy is feasible, preferably with a mixture of pure amino acids Adequate cardiac and renal function is necessary and acidosis must be watched However, the calone and nitrogen intake 18 limited and so is not comparable to oral therapy which should be employed whenever possible, especially by means of natural foods ficial effect of high nitrogen therapy on the course of the patient is suggested when the result in a series of carefully controlled ulcer cases undergoing partial gastrectomy are reviewed, both in respect to the maintenance of nitrogen equilibrium and to the clinical course after the procedure

"THE VILE WEED"

Those persons who mast on smoking that "vile weed," tobacco, will see the error of their ways after reading the following words of James the First of England, quoted in a Treatise on Tobacco, Tea, Coffee, and Chocolate, by Simon Pauli, London, 1746, in the

Library's collection
"At last, therefore, O Citizens, if you have any Sense of Shame, or Dread of Infamy, left in your Bosoms, lay aside the Use of Tobacco, a Custom attended with Ignominy, received through Error, and

By its Means the Wrath established by Stupidity of Heaven is excited against us, the Health of our Bodies impaired, our Substance wasted, and the Dignity of our Nation not only diminished at Home, but also despised Abroad, for Tobacco is a substance loathsome to the Sight, disagreeable to the Lungs, and, by its Clouds of black Smoak, nearly resembling the horrid Steams of Hell"

January, -ArmyMedical Library News, 1947

CLINICOPATHOLOGIC CONFERENCE

FOURTH MEDICAL DIVISION OF BELLEVUE HOSPITAL, New York City Date October 28, 1946

Conducted by HARRY A. SOLOMON, M.D., AND WILLIAM A. LEFF. M.D.

ACUTE EXACERBATION OF A CHRONIC COR PULMONALE

Dr. William A. Leff (Resident) The patient, A. G., a 75-year-old white woman was admitted to the Fourth Medical Division of Bellevue Hospital on July 31, 1946, with the chief complaint of dyspnea of six weeks' duration. Prior to this time, except for occasional ankle edema and an episode three years previously of dyspnea and ankle edema, she had been well. This episode lasted for two weeks and occurred while she was a patient at another hospital. Information obtained from this Hospital revealed that the patient had been admitted in January, 1943, with the diagnosis of small bowel obstruc tion due to an enterolith She was operated upon and the enterouth broken up. She was read mitted in January, 1944 with a diagnosis of incisional hernia, operation revealed a histus hernia. On both of these admissions, the heart was found to be normal in size with regular sinus rhythm, no murmurs, and no cardiac his-

Six weeks prior to admission to Bellevue Hospital, the patient noticed progressive anorexia, occasional nausea, and vomiting She stated that she had eaten only a very small amount of food. She described the vomitius as greenish in color and denied any hematemests, melena, or clay-colored stools. During these six weeks, she had a slight cough productive of small amounts of yellowish sputim.

Physical examination revealed an elderly, acutely ill, white woman who was dyspneid, orthopneic, and slightly oyanotic but very cooperative. The temperature was 98.4 F, the pulse 100 per minute respirations, 24 and blood pressure, 140/75. There was conjunctivities and blephantis of both eyes. The fundi showed marked venous dilatation and two plus sclerosis of the arterioles. The lips were cyanotic, the tongue was beefy red and showed marked papillary atrophy. There was marked venous engorgement of the neck vessels. The chest was symmetrical with many rhonchi heard through out. (The first observer heard musical and moist rules.)

The heart was enlarged to the left
The heart sounds were of poor quality with
auricular fibrillation ventricular rate was 102
and pulse rate, 72
A soft systolic murmur was
heard at the apex
There were no thrills felt

There was a well-healed midline abdominal scar and four plus edema of the abdominal wall. There were no viscera palpable The extremities revealed four plus nuture edema.

Course and Laboratory Data. - On admission the white blood count was 12,400, with 88 per cent polymorphonuclears (18 per cent immature forms) and 12 per cent lymphocytes The red blood count was 5.300,000 with 10 9 Gm. of hemoglobin. Urinalysis showed specific gravity of 1 008, there was no albumin, glucose, or acetone present, microscopic examination revealed only an occasional red and white cell. The blood non protein nitrogen was 32 mg per cent. The patlent was treated for heart feilure with digitalin nativelle, glucose, aminophylline, and mercu purn, all of which seemed in vain as the patient became progressively worse. On several occamons the patient vomited coffee-ground material which was positive for blood with the benzidine test

The following day she was entically ill, blood pressure had dropped to 85/55 and she was markedly evanotic, lethargic, and very weak. The lungs however, were clear to percussion and auscultation. The liver edge was barely palpable and the edema persisted. The urinalysis revealed a specific gravity of 1 010 and occasional hyaline cast. The white blood count was 6,600 with 68 per cent polymorphonuclears (10 per cent immature forms), 30 per cent lymphocytes, and 2 per cent monocytes blood count was 5,400,000 She suddenly developed a rapid regular rhythm, became ex tremely cyanotic and expired on the second hospital day A roentgenogram of the chest taken at the bedside showed the following the traches was in the midline, the right diaphragm was elevated to the fourth interspace anteriorly while the left diaphragm was hazy and barely seen extending up to the fifth interspace anteri There was a homogeneous density continu ous with the heart shadow at the right cardiophrenic angle and marked enlargement and straightening of the left side of the heart. The pulmonary artery and pulmonary conus were very prominent with enlargement of the right auricle. The electrocardiogram taken a few hours after admission showed slow auncular fibrillation and right axis deviation, a subsequent tracing, several hours prior to exitus, showed a rapid supraventricular tachycardia with rate of 150

Discussion

DR HARRY A SOLOMON It is obvious that this patient presented the clinical features of advanced congestive heart failure There was the marked air hunger with dyspnea, orthopnea. and cyanosis Distension of the cervical veins was prominent and massive edema extended to The heart was eninclude the abdominal wall larged with a forceful apical impulse visible in the anterior axillary line Auricular fibrillation and marked tachycardia were noted A soft blowing systolic murmur heard over the mitral area was consistent with the marked dilatation of the left ventricle, and the accentuated second pulmonic sound and pulmonary congestion fitted in with the features of left ventricular insufficiency

What information was available to determine the etiology of the heart condition? Because of the cardiac enlargement and eyeground changes, hypertension seems to have been present at some time, arteriosclerotic heart disease of "semile" myocarditis could be considered on the age group, and although the history reports a "heart attack" with edema three years ago, no pain factor was elicited at any time to suggest a coronary insult.

Masked hyperthyroidism should always be looked for in congestive heart failure with auricular fibrillation or ventricular tachycardia, particularly with resistance to digitals as in this case, however, there was no evidence for this condition clinically, and the chest plate showed no substernal shadow or displacement of the trachea to indicate a substernal goiter

What part did chronic nutritional insufficiency play in the cardiac picture? Certainly there were signs of vitamin deficiency with atrophic glossitis, anasarca, and a three-year history of severe gastrointestinal trouble. Against the diagnosis of vitamin B deficiency heart disease was the fact that the apex beat was localized and forceful, rather than diffuse and weak, the cardiac enlargement was mainly to the left instead of diffuse dilatation, the electrocardiogram did not show the characteristic low voltage pattern seen in beriberi heart, the edema was firm and dependent in type rather than generalized and soft, and peripheral neuritis was absent

So in the absence of definite evidence it might be best to state that the cause of the heart condition was unknown

Measures were immediately instituted to combat the failing circulation. Digitalis was given intravenously to make the heart work stronger and better, oxygen and sedatives given to de-

crease its load, diuretics to remove the effects of heart failure, and aminophylline to relieve vasospasm and bronchial spasm. Yet, in spite of their prompt and complete therapeutic regimen, circulatory collapse intervened rapidly.

What was the reason for failure to respond to Was there overwhelming myotreatment? cardial damage due to coronary thrombosis? If so, it was silent in the sense that pain was absent and the electrocardiogram did not show recent changes Then there is the possibility of physiologic of terminal exhaustion of the myocardium with insufficient muscle tissue left to respond to stimulation, a purely speculative inference of course We cannot overlook the possibility of digitals poisoning due to previous digitalization or digitalis sensitivity. It is true that after digitalis was given a slow fibrillation changed to rapid tachycardia, but whether this was due to rapid auricular flutter or ventricular tachycardia is not known

Of course, the short stay of the patient did not permit much observation, but there are a few unusual features that may merit discussion First, it was noted that the pulmonary congestion cleared while the other signs of failure progressed. This was confirmed by the chest x-ray which showed the marked enlargement of the left side of the heart without pulmonary congestion. Can this be interpreted on the basis of the Bernheim syndiome which the pathologist may demonstrate?

Second, in the x-ray of the chest, the shadow extending from the left border of the heart is It is wide and straight, and probably does not represent massive enlargement of the left ventricle, for one would expect corresponding enlargement to the right in such severe congestive In fact, the right border of the heart failure heart shows strikingly little change Of course, it is not possible to read too much into the x-ray from a postero-anterior view alone, but one has to consider that a dilated pulmonary artery may be responsible for the upper part of the left cardiac There are several unusual features shadow about the edema which was massive, postural, and over the leg areas quite indurative cardiac basis such passive congestion would be expected to be reflected by the kidneys was lacking as seen in the urinary findings and absence of blood nonprotein nitrogen elevation In looking for an extracardiac factor, obstructive thrombotic disease of the deep veins would, of course, be the commonest source, and thus on the basis of thrombo-embolic disease, the upper part of the peculiar shadow making up the left cardiac border can be attributed to dilatation of the pulmonary artery

As to the hematemesis, one cannot be too much

611

impressed either with its significance or degree in the absence of anemia or other findings. A hastis hernia was known to have been present so that bleeding from this area or any other part of the stomach or esophagus is a possibility the nature of the pathologic area being entirely speculative in the absence of other findings. It would be surprising if an ulcer of the hiatus hornia was found by the pathologist.

In summary, then, it can be stated that a 75year-old woman was admitted to the Hospital with the chincal picture of advanced congestive heart failure. Despite a prompt and complete them peutic regimen circulatory collapse was not averted

The cause of the heart condition was not known, but there was some clinical evidence for hypertension, arteriosclerosis, "senile' myocardi tis, masked hyperthyroidism, and vitamin B deficiency

In an attempt to explain the failure of the heart to respond to treatment, conditions such as 'silent' coronary thrombosis, physiologic exhaustion of the heart muscle, and digitalis toxicity were discussed

To account for certain unusual clinical features, the presence of Bernheim's syndrome and thrombo-embolic disease were suggested.

The development of hematemests in the presence of a hiatus hemia, previously allent, raised the question of a bleeding ulcer in this sac

As it was possible to observe this patient for but a very short period during the terminal phase of congestive heart failure, it would not be sur prising if the pathologist reveals other conditions that were overlooked.

Dr. Max Truber Perhaps with edema of the obstructive type we could postulate a source of emboli from the lower extremities and this would explain the right axis deviation. In the absence of evidence of mitral stenosis it may be a cor pulmonale. The absence of the more concentrated urinary specimen without evidence for enal failure is not the usual finding in congestive heart failure. The eyeground changes could simply be those found in an older person and do not predicate the existence of a previous hyper tension. The vomiting and anorexia might be on the basis of a low-grade intestinal obstruction.

Dn. Louis F Bisnor, Jn II it were not for the history from the other hospital, I would say that this patient had a classic picture of mitral disease. I think that the age factor can be disregarded to some extent. This condition has been discovered in older people.

Dr. ELLIOTT HOCHSTEIN There are three leatures that stand out in this case. First, the configuration and chamber analysis of the x-ray is indicative of involvement of the outflow tract of

the right ventricle without evidence of enlarged left auricle. Second, the electrocardiogram showed marked right axis deviation with an inverted T4. Third, I agree with Dr. Trubek in that the clinical course indicated an acute embolic phenomenon to the lungs. In view of the above three, I believe this case to have been one of acute and chronic cor pulmonale.

Dr. Mennasch Kalkstein Was the hver en larged?

Dr. Harry A. Solomon The liver could not be felt because the abdomen was so greatly distended

DR ZACHARY SAGAL The patient had gastrointestinal episodes on two occasions. She had vomited blood. The absence of anemia could be discounted as due to concentration because of the four plus edemn. The cardiac condition may be due to a toxic state secondary to intra-abdominal pathology—partial obstruction, perhaps, due to mallenancy in the matrointestinal tract.

DR MAX WILHELM JOHANNBEN If this were a case of congestive heart failure, the specific gravity of the urine would be about 1 010 and we would expect some albuminums. If, however, the specific gravity was fixed at 1010 in spite of heart failure, then the patient would have uremia with a corresponding monocytic normochromic anemia Therefore, I do not beheve that the edema of the legs is an expression of congestive heart failure but more likely the result of phlebothrombosis and varicosities. Multiple embeli to the lungs may produce the picture as seen in this patient and thus explain the cor pulmonale The hypochromic anemia in view of the hematemesis suggests as an additional possibility carcinoma of the stomach.

DR. MENNASCH KALKSTEIN Another factor in favor of repeated thrombo-embolic phenomena, to explain the picture of cor pulmonale, is the mode of exitus which suggests a sudden massive pulmonary infarction

Discussion of Pathology

Dr. Henry Spitz Autopsy revealed a well developed and well-nourshed white woman with marked pitting edema of the lower extremities and about 1 000 cc. of ascitic fluid in the peritoneal cavity. No free fluid was found in the pleural cavities. The heart was considerably enlarged in the absence of appreciable arteriosclerosis of the aorta, kidneys, or coronary arteries. It weighed 575 Gm. and the hypertrophy and dilatation was most marked in the right ventricle which measured 10 mm. in thickness while the left ventricle was only 11 mm in thick ness. In the right auricle there were multiple mural thromb, filling the auricular appendage and lying scattered irregularly over the auricular and a proposition.

wall They were yellow to red, firmly adherent, and smooth of surface Some of them were pedunculated The foramen ovale was anatomically patent The overlapping flaps of the interauricular septum were held apart by a thrombus that protruded into the right and left auricle and completely plugged the foramen the right ventricle two mural thrombi were pres-One large thrombus was attached to the interventricular septum in its apical one half. and another thrombus was adherent to the lateral wall The endocardium in and around these areas was opaque and fibrotic and white fibrous streaks extended into the underlying myocardium. The coronary arteries were entirely unobstructed, of the usual distribution, and showed only minimal sclerosis All the valves were grossly unaltered with the exception of the mitral that showed moderate diffuse fibrosis The outflow tract of the right ventricle was Both main branches of the pulmonary widened artery were narrowed but not completely occluded by firmly adherent thrombi larger intrapulmonary branches of the pulmonary artery also contained old mural thrombi, some of which occluded the onfices of smaller branches In addition, the arteries showed mild intimal sclerosis and peculiar ridges criss-crossing in all directions, and occasional thin bands that traversed the lumina of the vessels and were attached to the vessel walls only at two points The ridges were most prominent at the orifices of smaller branches, causing considerable constriction at these points The orifice at one vessel. for instance, measured 4 mm in diameter whereas immediately behind this point the diameter was 8 mm There were no infarcts anywhere in the lungs The combined weight of the lungs was 630 Gm They were crepitant throughout and showed neither edema nor consolidation The abdominal viscera were congested spleen there was a retracted scar, apparently an Diverticula of the duodenum and old infarct the colon, polyps of the endometrum, and small ovarian cysts were incidental findings

Microscopic examination showed old, well-organized thrombi in the pulmonary arteries. The ridges and bands were composed of old hyalinized connective tissue and sometimes showed a core of granular hyaline material similar to the hyalinized portions of the thrombit that had not yet undergone complete organization. The fibrous tissue making up the ridges lay entirely inside the elastica interna. The blood vessel walls beneath these thickenings were essentially unaltered and showed no scarring nor any evidence of recent inflammation. Atherosclerotic changes, where present, were mild

The total picture is that of cor pulmonale with

heart failure secondary to considerable obstruction to the flow of blood through the lung This obstruction is produced by multiple thrombi with organization involving the main branches as well as smaller intrapulmonary branches of the arteries Extensive thrombosis of the pulmonary arteries is one of the rare causes of chronic cor pulmonale Only a few similar cases have been reported 1-4 In the first two reports, the thrombi were found in the main pulmonary arteries and the ridges described in this case were not These ridges and bands had attracted the attention of some observers 6 who excluded the possibility of their being congenital anomalies and showed them to be organized thrombi The bands were thought to develop from partly organized thrombi under the impact of the blood The findings in this case bear out their origin from thrombi The origin of the thrombi is not quite clear They may be embolic in nature Thrombi in the right auricle and ventricle are not uncommon foci for embolization to the lungs The deep leg veins, however, cannot be evcluded as primary foci Due to lack of permission they were not examined in this case The absence of inflammatory lesions in the walls of the pulmonary vessels speaks more for the embolic mechanism. The only feature that would suggest the possibility of autochthonous thrombosis in the pulmonary arteries is the fact that the thrombi in the lungs are much more extensively organized than in the heart and, therefore, may be older The extent of organization is, however, no absolute proof of the respective age of the thrombi, since the small size of the pulmonary thrombi may have enhanced their rapid organiza-The mild sclerosis of the pulmonary arteries might be considered as a primary factor, but this sclerosis may well be secondary to the rise in intra-arterial pressure following the narrowing of the vascular bed by the progressive thrombosis On pure histologic grounds a differentiation between organized emboli and autochthonous thrombi is not possible at this stage Thus, the question as to the origin of the thrombi in the lungs cannot be answered definitely in this It would seem probable that primary embolization and secondary thrombosis played a part

In the absence of coronary sclerosis the thrombi in the right side of the heart are of particular interest. They are, for the most part, superimposed on areas of endocardial and myocardial fibrosis. Although the thrombi in the right auricle may be secondary to auricular fibrillation, this explanation does not hold for the thrombi in the ventricle. A report has recently appeared describing a picture of endocardial and myocardial fibrosis with thrombosis and discuss-

ing their possible relationship to avitaminosis B Vitamin deficiency was suspected clinically in this case Although a complete picture of acute beriberl was not present, avitaminous should be considered as a possible cause for the fibrotic changes in the heart. The high red cell count in the blood and the hyperplasia of the bone mar row represent a compensatory mechanism that is often observed in cases with impaired oxygenation of the blood

The changes in the other organs were the result of chronic passive congestion. The scar in the spleen was an infarct and section demonstrated an organized thrombus in the luman of the artery supplying the infarcted area This was probably the result of local thrombosis. However in view of the patent foramen ovale and the evidence of hypertension in the right side of the heart, para dox embolism cannot be excluded.

It is quite characteristic that, as in this case, clinical symptoms appear late. When the obstruction of the pulmonary vascular bed develops gradually, only a high degree of stenosis produces symptoms It has been shown in experiments on dogs that the diameter of the pulmonary artery may be reduced up to 70 per cent until the blood pressure drops in the greater circulation. Death

occurred when 80 per cent of the circulation was obstructed. Heart failure in the absence of a history of hypertension or intrinsic heart disease. progressive dyspnes, and hypertrophy of the right ventricle should suggest progressive obstruction to the flow of blood through the pulmonary arteries. These cases rarely respond to the usual treatment of heart failure, and usually die several weeks after the onset of symtoms.

The anatomic diagnoses were as follows mul tiple thrombi in pulmonary arteries with organi sation, hypertrophy and dilatation of heart, nght ventricle (cor pulmonale) mural thrombi of heart, right auricle and ventricle and in patent foramen ovale, sclerosis of pulmonary arteries. chronic passive congestion of liver, spleen, and intestines, ascites, anasarca, infarct of spleen, and hyperplasis of bone marrow

TECHNICAL EXHIBITS at the ANNUAL MEETING

 $\mathbf{P}_{ ext{HYSICIANS}}$ planning to attend the Annual Meeting of the Medical Society of the State of New York, May 5 to 9, in Buffalo will want to spend some time viewing the many excellent exhibits arranged for their inspection. The Memorial Auditorium affords ample space for a greatly expanded Scientific Exhibit Section. The number of Technical Exhibits, too, has been increased. Exhibits will be con veniently located adjacent to meeting rooms.

ABSTRACT OF MINUTES OF THE COUNCIL OF THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

T ITS meeting on February 13, 1947, the Council considered various matters, taking final action or directing further study and reports as indicated under the following headings

Tribute to Dr William Hale

PRESIDENT LOUIS H BAUER "Gentlemen, it looks as though an unkind fate were pursuing the Medical Society of the State of New York First, we lost Dr Dwight and Dr Flynn, and then the crowning blow was the sudden death of Dr Hale I don't know of any circumstances under which I would rather less have become president than those that have occurred It means a rather long ordeal. and I am going to rest heavily on your shoulders to help me out for the next eighteen months I think the very first thing we should do this morning is to stand for a moment in silent tribute to Dr Hale"

The members arose and stood with bowed heads in silent tribute to the memory of the late President

William Hale

It was voted that a suitable memorial to Dr. Hale be drawn up for presentation to the Council and Board of Trustees The President, with the approval of the Council, designated Drs Anderton, Gartner, and Mellen as a committee to draw up this memorial

Secretary's Report

Remission of State Assessments —The remission of State assessments was voted on account of service with the armed forces for 344 members for 1947, 11 for 1946, and 2 for 1945, also on account of illness for Drs John R. Farrell, Charles E Haynes, William Hinz, J Francis Messemer, Samuel H Nerenstone, Morris Worton, Mary N Sloan, Ray-mond E Elliott, William Braunstein, Bertram E Marks, Morris Schoenfeld, and Isaac Arthur Stoloff The refunding of dues for one member was author-

The untimely death of President William Hale in Utica on January 16 has shed a mist of sadness over the State Society office, from which we have not yet Dr Hale's dignified and impressive funeral on January 18 was attended by Drs Bauckus, Cunniffe, Hannon, Kaliski, Masterson, Mellen, Mitchell, Post, Trick, Wertz, Mr Anderson, Miss

Lyon, and myself

In accordance with Chapter VII, Section 2 of the Bylaws of the Medical Society of the State of New York, I have notified Dr Louis H Bauer that he has

succeeded to the presidency

Before his death, Dr Hale appointed Dr Leo F Schiff, of Plattsburg, New York, to replace Dr James F Flynn, deceased, on the Malpractice Defense and Insurance Board, as authorized by the Council.

Meetings Attended —On January 15 your Secretary visited the office of the Veterans Medical Service Plan of New York, Inc, at Watervliet, where I had a satisfactory interview with Dr Pettingill, chief medical officer, and Dr Guyer, assistant chief medical officer of the local US Veterans Adminis-That afternoon, with Dr Hannon, I represented our Society at a hearing of the Board of Regents of the NY State Education Department This meeting was called because the Nurse Advisory Council of the Education Department had recommended that the existing law requiring licensing

of practical nurses not be rescinded, and that a study of nursing and nurse education be undertaken for the Department by a committee to consist of two doctors, two nurses, two hospital administrators, and two educators Dr Norman S Moore, of Ithaca, a member of the Nurse Advisory Council, was also

present and addressed the meeting

On January 27 it gave me great pleasure to attend a luncheon given by Dr J Stanley Kenney at the NY Athletic Club in honor of President Harrison Shoulders of the American Medical Association, and Mr John Hayes, president of the American Hospital Two days later I was honored with a seat on the dais at a dinner given to commemorate the 125th anniversary of the Medical Society of the County of Kings at the Hotel St George, Brooklyn At this meeting Dr Louis H. Bauer presented the medal of the Medical Society of the County of Kings to Dr Thurman B Givan, retiring President On February 2 your Secretary attended a cocktail party given by Dr Leoni N Claman, secretary of the N Y State Women's Medical Society, and on February 5 I attended a luncheon of the American Social Hygiene Association at the Hotel Pennsylvania February 9 and 10 your Secretary attended a meeting of the National Conference on Medical Service, and the Congress on Medical Education and Licensure in Chicago, where informative and up-to-date programs were presented

You will later receive the reports of the various

committee meetings which I have attended.

Communications -Letter dated January 20, 1947, from Dr Hobart A Burch, Secretary, Medical Society of the County of Chemung, re selecting a panel of five candidates to submit to Governor Dewey to replace Dr Godfrey, returing Commissioner of Health of New York State

In this connection Dr Bauer stated that he had had a conference with Governor Dewey at the Governor's request, and one of the matters he brought up was the appointment of a successor to Dr Godfrey The Governor would like some names submitted to him more or less unofficially, but intimated that he would give a good deal of weight to the recommendations which were made discussion.

The Council authorized Dr Bauer to write to Governor Dewey Dr Anderton was instructed to reply to Chemung County that the Council does not desire to have a panel appointed masmuch as the President has already been in conference with the Governor on this and other subjects, and because the Council has made recommendations to the Governor

Letter dated January 18, 1947, from Dr Conrad Rissburger re resolution on euthanasia, passed by the medical staff of St Peter's Hospital, Albany, New York.

The Secretary stated that this had been ac-

knowledged No action was taken

Letter dated January 17, 1947, from Dr John J Masterson, Chairman Pro Tem, Nominating Committee of the United Medical Service, Inc., submitting the following list of physician directors for ap-Dr Harry Aranow, Dr Dr Chester O Davison, proval or disapproval Dr Harry Aranow, Thomas M d'Angelo, Dr Chester O Dav Dr M J Fein, Dr Milton Goodfriend, Charles Gordon Heyd, Dr David J Kaliski,

John J Masterson Dr DeWitt Statten, Dr M DeM. Touart Dr Nathan B Van Etten Dr I. Ogden Woodruff, and Dr Irving S Wright. It was weed that the above members be nomi

nated.

Letter from Dr Harry Aranow thanking the Council for their expression of sympathy on his ill

Letter of appreciation from Mrs Hale.

Letter dated January 14 1947 from Mr Harvey T Sethman, secretary treasurer, Conference of Presidents and other officers of State Medical Associations, requesting contribution of \$50 toward the expenses of the Conference of Presidents. After discussion.

It was roled that Dr Anderton write Mr Sethman stating that since there is now a midwinter session of the House of Delegates of the American Medical Association there does not seem to be any useful purpose in continuing this organization, that the Council would be glad to hear of any specific reasons why it should be continued, and that the Council does not care to continue its support of the organization.

The following letter to Dr Anderton from Dr J Hillis Miller Associate Commissioner the State Education Department Albany, re training and licensing of physiotherapists in the State was read

"I am writing to you as Secretary of the Medi cal Society to express my concern with respect to the training and licensing of physiotherapists in the State. The physiotherapy law as you know requires four years of training which is more or less equivalent to the training expected of a physi The law also provided a grandfather's clause which resulted in the admission to the profeesion of physiotherapusts variously trained prior to the effective data of the law As a result we have in the profession at the present time a con siderable number who did not have in all respects satisfactory education and training Moreover because of the high requirements of the law we have not heensed any physiotherapists since the law went into effect. Because of the high stand ards we have been unable to register a single school of physiotherapy in the country

On the other hand, we have a number of institutions training so-called physical therapy technicians. These technicians are serving the medical profession and are, in my opinion prac ticing physiotherapy without a license. This has resulted in my opinion in a thoroughly unsatis-

factory atuation

I am writing to suggest that the Medical Somety appoint a committee to make a study of this entire problem I would hope that the committee would consult the physicians and arrive at a program of study which would be satisfactory to them I am not convinced what this program of study should be or that it needs to be four years in length even for those who start with no professional or even allied training It would seem altogether possible to take graduates of physical education schools and graduates of schools of nursing and give them a course of training of one year or two years duration and thereby turn out a product which would meet the nceds of the medical profession and the people of the State.

I would be pleased to have your reaction to my suggestions, and if I can be of any service in connection with this problem I hope that you would feel free to call upon me.

After discussion,

It was roted to refer this matter to the Committees on Legislation and Public Health and Educa tion to study and report

Letter from Mr Thomas A. Hendricks, Secretary Council on Medical Service and Public Relations American Medical Association, Chicago Illinois, re funds for cancer control program. After discus-

sion,
It was roted that Dr Mitchell supply Dr An-

Letter from Dr Milton A. Carvalho Secretary Broome County Medical Society, Binghamton New York, re Association of American Physicians and Surgeons' proposed essay contest. After dis-

It was decided to approve Dr Anderton's reply. stating it might be a mistake for county societies to take part.

Letter from Dr Winslow expressing his regret at not being able to attend the Council meeting and hoping he would be able to be at the next one

A letter dated February 6 1947, was received from the Medical Society of the County of Erie reading

Last year the Medical Society of the County of Erie acting through its Workmen a Compensa tion Committee requested all Eric County radiol ogusts associated as such with hospitals to submit to the Society proof in the form of an affi-davit that the provisions of Section 13-d (29) of the Workmen's Compensation Law, regarding the division of fees, were being observed. In taking this step the Society was motivated primarily by a desire to protect the radiologists, inasmuch as the penalty for violation is placed on the doctor and not the hospital Practically all of the hospi tals had salary or commission arrangements with their radiologists, a situation largely due to un familiarity on the part of both with the law on the subject of fees and their division. The Society's action served to focus attention on hospital radiologist relationships with the result that many of our hospitals have discontinued salary and commission payments or other illegal fee practices

Some of the hospitals, however are still opera ting their x ray departments in an unlawful manner in the expectation that favorable legislation will be forthcoming at the present session of the

State Legislature.

The attitude of the Medical Society of the County of Ene toward any change in the existing law regulating the practice of radiology in hospitals is expressed in a motion unanimously car ried at the January 28 1947 stated meeting, that we oppose and call upon the Medical Society of the State of New York to do likewise any altera tion of or amendment to those statutes which limit x my practice to authorized physician rocntgenologusts bar hospitals from rendering bills for x ray services and which prohibit radiologists from accepting salaries or commissions from hospitals or from remitting more than 331/1 per cent of the fees received for x ray services, to hospitals fur nishing facilities for the operation of x ray departments.

Vory truly yours, /8/Arthur F Glasser M.D. Prendent /8/Joseph C O Gorman M D Chairman Workmen & Compensation Committee. After discussion.

It was agreed that Dr Bauer reply to the effect that the Council is against any alteration of Section 1250, and at this time does not favor amending Section 1263

Treasurer's Report was Accepted

Report of the Executive Officer

Dr Hannon reported that the Legislature is now in the most active portion of its year, that February 12 a chiropractic bill had been introduced in the Senate, that no antivivisection bill had been introduced but there probably would be, especially after the publicity in the Journal-American on the same day. There are several bills of particular interest to the Society. One group including the Milmoe Bill is now received with apprehension. The Department of Education feels that such a law would be licensing the corporate practice of medicine and they think it dangerous. A bill has been introduced which would define x-ray as the practice of medicine. The Society has introduced a bill at the request of the Grievance Committee which the Legislative Committee had approved, amending the Education Law in regard to the addiction to morphine, and advertising in newspapers.

There was a meeting of the County Legislative Committee Chairmen in Albany on Tuesday, February 25 Saturday, February 15, was the last day for departmental bills to be introduced and February 26 was the last day on which bills could be intro-

duced in the Assembly

Activities of Committees

Committee on Legislation—Dr Aranow, the Chairman, being ill and excused, the Executive Officer's report was accepted for the Committee

The President brought up the following legislative

matters

1 A letter from Senator Desmond stating he had introduced a resolution in the State Senate calling for the establishment of a Commission to Study the Problems of the Aged This proposal was supported by the Legislative Committee and reads as follows

"Resolved, That the Assembly concur in the joint legislative committee as hereby created to consist of four members of the Senate to be appointed by the Temporary President of the Senate and four members of the Assembly to be appointed by the Speaker of the Assembly, with full power and authority to proceed with the study and investigation of the effects on our state of an aged population and the proper role of the state in dealing with these effects and resulting problems. Such study is to include (1) low cost housing and sheltered care for the elderly, (2) recreation facilities for the elderly, (3) employment policies regarding the elderly, (4) adequacy of Society Security for the elderly, and (5) guidance and counseling for the elderly, and be it further

"Resolved, That the study and investigation hereby authorized is not limited to the specific matters herein contained or enumerated by the committee in the conduct of such investigation and may inquire into every matter and thing considered to be relevant to the problem of the aging, even though not specifically mentioned therein to the same extent as though specific power and authority

therefore was expressly granted herein."

The letter goes on to say how the committee shall function, and that \$15,000 is to be provided to pay its expenses After discussion,

It was voted that the Council approve this resolution

In connection with this same matter, Dr Bauer stated he had received a letter from Dr C Ward Crampton, requesting that a special committee be appointed to study the matter of the aged and the aging, and make recommendations for appropriate action by physicians, county societies, social agencies, and the government of the State.

It was voted that Dr Bauer be authorized to write to Dr Crampton that the matter was referred by the Council to the Committee on Public

Health and Education

2 Dr Bauer stated he had received a letter from Dr Aranow which expressed concern about the podiatry and physical therapy bills which were being introduced, and requested Dr Hannon to explain them

DR HANNON "There is a bill being introduced to amend the Education Law in regard to the practice of physiotherapy That bill puts the definition under Section 1250 where it has not been before. The bill states that the practice of physiotherapy shall be the use of actinotherapy, mechanical and thermal therapy, and electrotherapy Where the former definition said 'exclusive of x-ray', this leaves that out

"This bill puts the words 'physiotherapist' and 'the practice of physical therapy' wherever 'physican' or 'medicine' is used throughout Sections 1268 and 1264. There is one question as to whether there is a trick in that or not, because under Section 1264 it says that the physiotherapist may not practice medicine except under the supervision of a duly licensed physician, and if they put physiotherapist in there as well, it might indicate he can practice medicine when not under the supervision of a duly licensed physician. I have talked to Senator Griffiths, Charman of the Education Committee, about this and suggested to him that this bill put in by the physiotherapists be ignored because the same things have been proposed under the revision of the Education Law by the Joint Committee"

After discussion,

It was voted that Dr Hannon and Dr Kaliski draw up a letter on this particular topic for transmission to the county societies, asking their participation actively in the campaign

The Podiatry Bill has been before the Committee on Podiatry, and we have had expressions on that, that they were not in favor of the bill, and I think it is advisable that it be made known—and we will make it known through the Bulletin—that there must be some extent these bills.

must be some opposition gotten in against these bills.

3 Dr Bauer stated that he had had two long communications from Dr C Gullo re a Basic Science Law It was brought out in discussion that an article was being prepared for publication in the Journal and that Mr Walsh of the Public Relations Bureau intends to interview both Dr Gullo and Dr F S Wetherell Dr Bauer said he would write Dr Gullo to that effect

Constitution and Bylaws—Dr Reuling, Chairman, reported he had received requests from three counties for approval of amendments to their bylaws Warren, New York, and St Lawrence counties Those from Warren and New York counties were approved as submitted St Lawrence proposed a change that was not in keeping with the State Society Bylaws, and the Counsel thought that should be clarified before approval was given.

Committee on Contract with Kings County Medical Society—Dr Charles D Post, Chairman, stated that the Committee is continuing its study

Committee on Questions of Ethics.-Dr Reuling Chairman, reported that he had a letter from Rich mond County as follows "Will you please inform mond County as follows "Will you please inform me whether it is ethical for a doctor to have an il luminated sign with his name and specialty?" After discussion.

It was decided that Dr Rouling reply and quote Section 31 A of Principles of Professional Con

Malpractice Insurance and Defense Board — The Board unanimously agreed to recommend that the Council direct Mr. Hackeling to make a complete audit including the loss vouchers from 1936 to 1946 inclusive In the opinion of the Board this is necessary to comply with the directive of the House of Delegates. Mr Hackeling estimated that the cost of this audit would be approximately \$2 000 and accordingly the Board agreed to recommend that the Council request an appropriation of \$2,000

for that purpose
On consulting Mr Hackeling he stated that he would charge only what the actual expenditures were In view of this, Dr Kenney requested that the Council recommend to the Board of Trustees as an emergency appropriation the sum of \$2,000 for

this audit.

It was roted that this be done.

Dr henney stated he had one other matter

"The Board took notice of the fact that all mal practice policies under the Group Plan of the State Medical Society by the terms of the policy contract, become effective at 12 01 A.M on the commencement date of the policy For that reason a policy applied for during any given day antedates to 12 01 A.M. of that day and therefore covers all acts committed on that day. Thus a member could apply for insurance in the M. insurance in the afternoon and secure a policy which would cover his acts committed during the morning

of that day
"After a thorough discussion the Board unanimously agreed to recommend to the Council that the Society's rule with respect to the dating of malpractice policies be amended by inserting after the word prior the words to the day following. The word prior the words to the day following

rule would then read as follows

"Protection under the Group Plan of Insurance of any member or applicant for membership in of any member or applicant for membership in the Society may commence on any day of the year holidays included provided that, in no event, shall it become effective prior to the day following the date on which the application for such protection is placed in the United States mail as shown by the postmark on the envelope in which it was mailed.

"The Board recommends that the Council ap-

prove this change

It was voted that this change be approved.

Committee on Medical Publicity —Mr Anderson,

in the absence of Dr Winslow reported that

News releases concerning postgraduate teaching programs were sent to newspapers in the counties of Richmond, Nassau, Broome, Wayne St. Lawrence, Jefferson, and Tompkins. The News Letter went out to our regular mailing list during the week of Janu

ary 10
On January 11 Dr Hale spoke on the A.M.A.
radio series, 'Doctors Then and Now over the coast-to-coast NBC network. His talk contrasted medical and health conditions of today with conditions of fifty years ago in the eastern area of the United States. The program dramatized the life and times of Dr Stephen Smith, and the material on which the script was based was gathered by the Public Relations Bureau.

Mr Anderson and Miss Lyon conferred with Miss Elizabeth Wilson, an authority on health insurance, on January 21, regarding the placing of her articles

on health insurance in magazines.

Miss Lyon conferred with Dr Theodore Allen
of the Metropolitan Life Insurance Company regarding ways and means of utilizing the Woman's Auxiliaries throughout the country in the Metro-

politian s current program on heart disease.

Miss Lyon attended the fifth annual Labor
Health Security Conference held at the Hotel McAlpin on January 24 and provided a report for use by the A.M.A. Council on Medical Service On the same day she attended the midwinter Executive Board meeting of the Woman a Auxiliary held at the Hotel Roesevelt. On January 24 she conferred with Mrs. Alfred L. Madden, President, and Mrs. Bradford F Golly Publicity Chairman, in regard to plans for a Woman a Auxiliary bulletin, the first one attempted by the Auxiliary in its ten years of existence

Mr Anderson and Mr Walsh went to Chicago the first week in February to attend the National Conference on Medical Care, the National Conference on Rural Health, the Conference on Public Relations of the State Medical Societies, and a meeting of the National Society for Medical Research.

Mr Anderson and Miss Lyon conferred with Miss Sara Carlton, a free-lance writer who is preparing an article on the use of animals in medical research. All our materials were made available to her in ad dition to a personal conference

Mr Walsh spent a week in Albany working with Dr Hannon on legislative matters pertaining to

basic science

basic science
The new publication "Check and Double Check
on Sickness Insurance, his had an excellent reception. As of January 20 we filled 581 purchase orders
for well over 9 000 copies. The income from this
source to date has been \$1,642.62. Orders have
come from points all over the country and many congratulatory letters have come from readers con nected with both medical and nonmedical organi sations. Mailings of circulars to solicit future orders from outside New York State are continuing

The Louisiana Physicians Service, Inc. has expressed interest in the leaflet, 'Damned with Faint

pressed interest in the leaflet, 'Danned with Faint Praise, published by the Bureau in 1944, and has ordered 2,000 reprints to be supplied at cost. This courtesy is being extended to them. Miss Lyon, who has been field representative and assistant to Mr Anderson for the past three and one-half years, left the employ of the Society on Fobruary 15 following her resignation on January 13. The best wishes of the committee and her newsy fixed in the Society and the office staff or many friends in the Society and the office staff go with her in her future undertakings. She has done an excellent job for the Society Additional praise comes from the Woman's Auxiliary which she served as consultant. A letter from the executive board of the State Auxiliary acknowledged 'her invaluable assistance to the presidents and chairmen with whom she came in contact, and stated that 'the cooperation between Medical Society and Auxiliary has been greatly advanced by her advice and assistance

Mr Edgar L. Cook has been engaged to fill the vacant position on our Public Relations staff

Committee on Nursing Education.—Dr Anderton

made a progress report.

Committee on Public Health and Education.— Dr Mitchell, Chairman, reported that he had on February 11 1947 conferred with the Chairman of the Subcommittee on Cancer and representatives

of the State Department of Health regarding a plan for having regional meetings of representatives of the State Department of Health, the Council Committee on Public Health and Education, the Subcommittee on Cancer, and the chairman of cancer committees of the county medical societies not entail much expense since the Government will contribute

After discussion,

It was voted that the Council approve the plan of

having regional meetings

Wednesday, February 12, 1947, a conference of the Council Committee on Public Health and Education was held in New York City to consider an educational program in BCG immunization as a part of the Tuberculosis Control program in New York State Present at this meeting, in addition to the Committee members, were some of the officers of the Medical Society of the State of New York, representatives of the nine medical schools in New York State, and representatives of the New York State Department of Health

There were twenty at this conference, and it was decided that it would be advisable to set up an Advisory Committee to study and report how the whole plan should be operated. Our share of the expense would not be great as the Government would defray the costs of instruction and those fea-

tures on the service end

It was voted that the President designate somebody to advise with him in the selection of our own members on that Advisory Committee, and then also confer with the Government officials to set up this small body to direct BCG immuniza-

tion in the State

At the request of the New York State Departments of Health and Education, a meeting of the Council Committee on Public Health and Education and the Subcommittee on Rehabilitation was held in New York City on this same day to consider fee schedules Present at this session were some of the officers of the Medical Society of the State of New York, representatives of the New York State Departments of Health, Education, and Social Welfare, and a group of physicians designated by the State Medical Society to act as advisers to the State Department of Health in the processing of applications for specialists ratings

In this connection, the Rehabilitation Program and also the Cancer Program were unfortunate in losing Dr Flynn as an adviser on radiology and x-ray work in general Someone to replace Dr Flynn was discussed with the late Dr Hale and with Dr Bauer It was agreeable to them to have Dr W F Howard, of Albany, who is professor of radiology at the Albany Medical School and chief of the Radiological Service at the Albany Hospital, appointed on the Committee to advise on these mat-

This appointment was approved by the Council Postgraduate Education —Letters were mailed from this office to the regional chairmen in obstetrics requesting that each chairman plan to have in his

region a teaching day
The Course Outline Book has been received from the printer and copies have been mailed to the following officers of the Medical Society of the State of New York, presidents, secretaries, and chairmen of public health, postgraduate education, and program committees of county medical societies, members of the Council Committee on Public Health and Education, and the subcommittees, regional and Education, and nediatrics, the delechairmen in obstetrics and pediatrics, the delegates from the various county medical societies to

the annual meeting of the House of Delegates of the Medical Society of the State of New York in May 1947, in Buffalo, the ex-presidents of the State Society, the presidents of the District Branches, section delegates, the State commissioner of health, and directors of the various Divisions of the New York State Department of Health, district health officers, city and county health commissioners, physicians who arranged courses in the Course Oulline Book, deans of the medical schools in the United States, the presidents of the universities in New York State, librarians of the medical schools in New York State, secretaries of the state medical societies in the United States, executive health officers of the various states, secretaries of national medical societies, members of the New York State Board of Regents, the New York State Commissioner of Education and directors of several Divisions of the New York State Education Department, officers of the American Medical Association, and members of the Council on Medical Education and Hospitals, Council on Medical Service, Council on Industrial Health, the director of the Bureau of Health Education, members of the Section on Preventive and Industrial Medicine, and Public Health of the American Medical Association, New York State Commissioner of Mental Hygiene, commissioner and director of Vocational Rehabilitation Service of the Department of Social Welfare of New York State, representatives of the National Foundation for Infantile Paralysis, and the Metropolitan Life Insurance Company, the surgeon general of the United States Public Health Service, secretary and executive secretary of the State Charities Aid Association and representatives of the New York State Health Preparedness Commission

The 1946-1947 Course Outline Book contains 67 announcements with a total of 88 pages, an increase of seven announcements and 20 pages over last

year's publication

Postgraduate instruction has been completed in Cattaraugus, Ulster, and Warren County medical At the present time, instruction is being given in Broome, Jefferson, Nassau, Oswego, Richmond, St. Lawrence, Tompkins, and Wayne County medical societies

Requests have been received from Nassau, Rockland, and Sullivan County medical societies to arrange for a series of postgraduate lectures and ar-

rangements are being completed

Also arrangements are being made for instruction to be presented in Cheming County and the Glens Arrangements are Falls Academy of Medicine also being made for instruction to be given in the late Spring before the Cayuga County Medical Society

Requests have been received from the Chemung and Queens County medical societies to arrange for

Spring teaching days

The report was accepted Dr Mitchell stated that Dr Hannon and the members of the Mental Hygiene Committee had approved the following letter, and requested the approval of the Council to sen 1 it to the Honorable Abraham Schulman, chairman of the State of New York Level Toward Towar York Joint Legislative Committee to Study the

Problem of Cerebral Palsy
"The Medical Society of the State of New York believes there is real need for additional facilities for research and treatment for patients afflicted with cerebral palsy While a considerable amount has been done in the past, such as that of the New York State School at Newark, New York, the

Government should increase its participation in the expansion of research and treatment programs throughout the State Such a program should have clearly defined standards for workers in this field, which includes physicians, occupational therapists, physiotherapists, and special nursing

"If the Medical Society of the State of New York and several of its committees can be of

further assistance, please let me know"

It was voted that the letter be approved and sent, with the word research underlined.

Committee on Public Relations and Economics -Dr Wertz, Chairman of the Committee, was not present, but Mr Farrell, Director of the Bureau of Medical Care Insurance, reported as follows "On January 15 your Director conferred with Dr

Wertz and his executive committee regarding a form letter to be sent to all participating doctors in

the Western New York Medical Plan

"On January 16 I met with Dr Aaron to arrange for the next meeting of his Subcommittee and to discuss an appropriate display sign for the coming State Society Convention in May

"On January 20 I conferred with Dr George S Nellis, of St Lawrence County, regarding a medical

care plan for St Lawrence County

"On January 31 your Director had a conference with Dr Dean Clark, of Health Insurance Plan, and was given material and different contract forms used by them "On the same date, on invitation of Dr Wertz, I

attended a meeting of the Joint Committee of the New York State Hospital Association and the Medical Society of the State of New York at the Society's

"On February 5 I conferred with Mr Evans, of the Northeastern New York Medical Plan at Albany, and Mr Dubar, of the New York State Department of Insurance

"On February 6 I called on the Medical and Surgical Care Plan at Utica, regarding statistical information for quarterly reports for our Bureau

Subcommittee on Public Medical Care -Dr

Wood, Chairman, reported

"The schedule of reimbursement charges that we now have, and which was set up last year, will continue in effect until December of this year At that time we will again attempt to increase it, and it is my own opinion that we may be able to get it up to the present workmen's compensation minimum fee schedule

"We have again prepared what we call a joint statement relative to the progress that has been made in welfare work. Several years ago one was We would much appreciate it if that published could be done again, this joint statement published in the Journal prior to the House of Delegates'

meeting Publication Committee —Dr Kosmak, Chairman, reported that Mr Anderson was having great difficulties in getting an adequate supply of paper for

the Journal

The cloth binding in 1941 for the 40 cents a copy This time the cover DirectoryDirectory cost 40 cents a copy

is going to cost 82¹/₂ cents a copy
Ten thousand dollars can be saved on the binding by having a stiff cardboard cover, a little_heavier than a telephone book, and that is the plan Printing costs and paper have practically doubled retail price of the volume has been raised to \$12 50 to nonmembers, and the orders are pouring in The

deficit on the Directory will probably be about \$40. This matter will be taken up with the Trusteen

at their meeting

Dr Reuling raised a question about the action taken last month which was "In view of this fact, and the numerous changes in addresses, it is felt that preparations should be begun as soon as possible to issue another volume in 1948. It is necessary in developing this *Directory* to have a competent staff. As it is difficult to organize such a staff, it is felt that it would be of great advantage to continue the present staff "

He felt this was not definite, and if this is to be interpreted, that we expect to publish a 1948 Directory, he would move that the Council direct the

staff to be continued

It was voted that Dr Kosmak's report be adopted including the recommendation made by Dr

Reuling

Committee on Rural Medical Service—Dr Mellen, Chairman, reported that there had been a meeting in Chicago last week, the purpose of which was to get the doctor to the people The meeting was directed in the control of the people. divided into groups There is no report on the discussion of those groups ready yet, but Dr Crocker stated they would be distributed later When these groups are heard from, and what they decided on their problems is known, it will be probably a help here

Committee on Veterans' Affairs —Dr Mellen, Chairman, reported that there had been no inquires for the last three months

It was voted that the Committee be dismissed with thanks

Committee on Liaison with Veterans Administration.—Dr Bauckus, Chairman, reported verbally

as follows

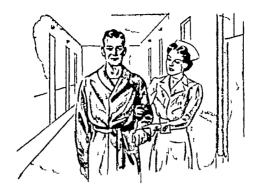

"The meeting of the Liaison Committee with the Veterans Administration occurred February 12. We also have the Veterans Medical Service Plan, an independent organization. It is, however, a child of the State Society. We more or less meet to gether We did not, however, have a meeting of the Veterans Plan yesterday, because we did not have a quorum, in fact, the only two members of the

Plan present were Dr Rooney and myself "There were certain items that I think the Councal should hear about and probably take action on should report that the addition of another Regional Office of the Veterans Administration in Brooklyn will necessitate the appointment of a coordinator there, and that necessitates in turn a slight change in the contract between the Veterans Plan and Veterans Administration. The information we had at first was that this office would be established immediately, but Dr Lane told us yesterday it would not be until the first of May However, the amount of work that is done here in the metropolitan area is

still present, and more help will be needed "We also secured from the representative of the Veterans Administration, Dr Lane, and others, the promise and a tentative agreement, which we expect they will sign with us, that the expenses of the Coordinators when they are called outside of their own area will be paid by the Veterans Administration It is important occasionally for the Coordinators to meet, and if they are called here or to some other place by Dr Lane or the Veterans Administration, the Veterans Administration will take care

of the expenses
"I should also report—and of course Dr Rooney
"I should also report—and of course and is interis Chairman of the Board of Trustees and is inter-

WHEN CHRONIC ILLNESS INCREASES THE NUTRITIONAL NEEDS

Chronic disease whether febrile or neoplastic, imposes many additional meta bolic demands upon the organism Paradoxically appetite is apt to wane at this time making satisfaction of these requirements difficult. In consequence weakness becomes excessive and the ability to resist secondary in fection is impaired.

Because it contains all of the nutrients known to be essential the dietary supplement made by mixing Ovaltine with milk can play an important role in augmenting the intake of the very nutrients needed. This nutritious food drink provides biologically adequate protein readily utilized carbohydrate highly emulsified fat. B complex and other vitamins including ascorbic acid and the essential minerals iron calcium phosphorus. Its delicious taste assures patient cooperation since it is taken with relish even when most other foods are refused.

[Continued from page 620]

ested in it, and will take care of it—that the plan of payment to the Medical Society for the money we have advanced to pay our Coordinators is in shape to take fruit, and we expect that prompt payment

will now be made
"We have the information that the Fee Schedule, Part 2, which contains many of the fees for specialists, is being mimeographed by the Veterans Ad-However, it has been proposed that ministration this be printed in the New York State Journal of I don't know for certain, but I think that some time ago the Council or someone in authority asked that this be done I heard you discuss a little while ago about the need for space in the Journal, etc , and I would like to say also that there is some question about the advisability of printing this fee schedule There are some good things about it, and some bad, but we are going to try to have a fee schedule in the hands of every physician It is already in the hands of the authorizing physicians I doubt if the doctor would keep the STATE JOURNAL to refer to for the fee schedule That probably should be before you as a matter of business whether or not you want to have the fee schedule appear in the Journal

"We spoke again of the need for more information going out regularly to the doctors. It is a complicated process that we have in taking care of the veteran, although in the end it becomes quite simplified as far as the final report and payment to the physicians is concerned, but the men in the field do not understand a great deal about it, and we should regularly get information to them I have, therefore, asked that the county journals of the larger counties take an interest in this, more than they have in the past I get these journals regularly ever since I have been President of the State Society, and I take much interest in them However, I note that we don't get the information sufficiently dissemi-

nated
"We restored the fee of \$20 for the neurologic to \$10 because it was felt that sometimes this examination was not made by specialists However, we got that straight-

ened out

"We also added a fee of \$150 for ureterotomy, an operation not previously in the fee schedule should point out here that the Liaison Committee, as your committee, has always gone into the question of the fee schedule, and has reported the fees to the Council, and the Council has so far approved what they have recommended Then this went to what they have recommended the Board of Directors of the Veterans Plan and they made the agreement on the fee with the Veterans Administration However, no fees have been printed or made official without your approval "I might also say that one of the reasons for re-

storing the \$20 fee for the neurologic examination was that it is in the workmen's compensation minimum fee schedule, and we have endeavored not to go below that We had a discussion of the fact that the general practitioner in many areas functions as an internist, and that in any area at all he may make Some have a complete first physical examination had the idea that the fee for that should be the regular \$3 00 treatment fee It was pointed out that the examination by the general practitioner for compensation rating purposes is set at \$7 50 and it was promised to us by Dr Lane that he would take care of the situation with his authorizing physicians, so that in those cases in which this examination was asked to be made by a general practitioner the fee would be \$7 50 We have felt, from analyzing the various figures we have so far, that the gen eral practitioner is very important, and should be considered much more thoroughly than we have done in the past in some instances

"We had a communication from the American Physiotherapy Association relating to fees for physiotherapy As you know, that question of physiotherapy and the cost of it is very important and difficult to handle The officers of this Association are cooperating with us, and I think that we are headed for better things along those lines

"We are going to have a change in our form The Federal Government will try to have a uniform form for use in all of the States However, it apparently is to be as simple as it is at present, and as far as New York State is concerned no change is contemplated immediately, and no change will be made

until the matter is discussed with us

"We have been working on the question of hospitals rendering services in the specialties of x-ray, pathology, anesthesiology, and physical therapy As you know, Dr Wertz, as Chairman of the Joint Committee of the N Y State Hospital Association and the Medical Society of the State of New York, has given this subject much study of late and has written to the heads of each of the Blue Cross or-ganizations in New York State telling them of our While Dr Wertz is not here today to report for that committee, only about a week ago I told him of the stand of the Veterans Plan in this matter, so he understands thoroughly I think, in general, he has tried to get the Blue Cross Plans to change their ideas on this subject I don't know that the hospitals have agreed to the Blue Cross acting in the capacity of an agent in their dealings with Veterans Administration on hospitalization under this plan-but I think they will, and I understand it is proposed that whatever the hospitals and the Blue Cross are doing at the present time will really be the basis of the hospital contract for veterans' care, but we are depending upon other agencies and other commit-tees, the Council, the House of Delegates, and Dr Wertz' Hospital and Medical Joint Committee for In the meantime, we are doing help in this matter what we can to combat it

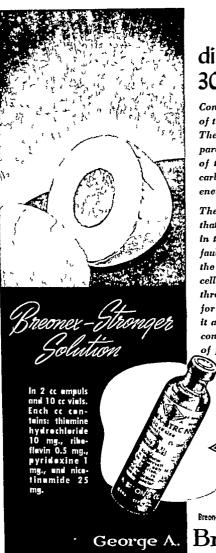

"We have had great difficulty in securing neuropsychiatrists, and this question of giving adequate care to those who need psychiatric attention is difficult. We have had in New York City a screening committee set up of prominent neuropsychiatrists who have been very helpful in looking over cases before final authorization is made for a great deal of

"I have had some experience with the workings of similar plans in other states Some of the plans of other states work through the medical care plan, and there is some difference between theirs and ours We have to learn, and we learn mostly from what our coordinators learn and tell us, and also we learn from what other physicians tell us. I think the from what other physicians tell us I think the members of this Council ought to make a special effort to let us know-you know who we are-what you think is wrong and offer whatever suggestions you can make to help us out This is important I think it is working out very well, but we are far from perfect I would be glad to answer any questions tions

After discussion,

It was voted that the previous action of the Council in regard to printing the fee schedule in the Journal be rescinded

[Continued on page 624]

direct to 30 billion "eggs!"

Consider the egg as a kitchen model of the primary unit of life, the cell.

The yolk and the white of the egg parallel the nucleus and the cytoplasm of the animal cell, wherein carbohydrate is stepped down as energy is stepped up

The egg might oftener remind us that metabolism does not take place in the organs as a whole, that every fault in nutrition goes directly to the chemistry of individual cells. The cells need coensymes of at least three factors of vitamin B complex for the combustion of carbohydrate; it appears that two of them are concerned also in the utilization of proteins

About 30 billion cells are said
to compose a human body
Breonex-Stronger Solution can
go direct to each of them,
it is given parenterally
In B complex deficiencies,
Breonex-Stronger aids
the physician to restore
the patient's well-being quickly

KANSAS CITY MO NEW YORK ATLANTA LOS ANGELES SEATTLE

[Continued from page 622]

Woman's Auxiliary —Dr Reuling, Chairman of the Advisory Committee to the Woman's Auxiliary, presented the following report as submitted to him by its President, Mrs. Madden

On January 23 and 24, 1947, the Executive Board of the Woman's Auxiliary to the New York State Medical Society met at the Hotel Roosevelt, New York City At this meeting, the President, Mrs Alfred L Madden, spoke of the great loss sustained by the Woman's Auxiliary as well as the State Medical Society in the death of its President, Dr William He was an enthusiastic sponsor of the Woman's Auxiliary, and aided the State Auxiliary as well as Oneida County Auxiliary in all its projects During the past year Dr Hale was particularly helpful in the Auxiliary organization plans

The following resolutions were read by the Recording Secretary, Mrs John J Gainer

"Whereas, the Woman's Auxiliary to the Medical Society of the State of New York has suffered a deep loss in the death of Dr William Hale, and "WHEREAS, he had been a staunch believer in the

part the Woman's Auxiliary could take in advancing the ideals and aims of the medical profession, and

"Whereas, during his short term as president, he did much to strengthen and promote the Auxiliary in accordance with one of the chief aims expressed in his inaugural address in May, 1946, and

"WHEREAS, in his home county of Oneida he had

long given his interest, advice, and active support to the County Auxiliary, and "Whereas, his strength and leadership and vigor-ous spirit will be greatly missed, therefore be it "Resolved, By the Executive Board of the

Woman's Auxiliary to the Medical Society of the State of New York, assembled at its midwinter session, that it mourns the passing of its friend and adviser, Dr William Hale, and be it further

"Resolved, That this resolution be spread upon the minutes, and a copy sent to his family "

At the conclusion of the reading of the resolutions, the President requested the Board to rise in a moment of silent prayer

Flowers were sent from the Auxiliary

Reports were filed from 25 counties, three revisions were suggested to the Bylaws

At 4 30 PM., January 23, a conference was held with the Advisory Council and the following sugges-

tions were brought up for discussion

1 That a letter be written by the Advisory Council to the members of the County Advisory Boards and also to Secretaries of the Medical Societies where there is an organized Auxiliary, explaining some of the duties of the Advisory Board

Suggestion that a member of the County Advisory Board also be a member of the Comitia Minora in order that the Medical Society be in closer con-

tact with Auxiliary activities

Advisory Council suggests that at the Secretaries' Conference, one of the secretaries to a county medical society that has an active Auxiliary speak to the group on how they use their Auxiliary, thus informing other secretaries how auxiliaries are used and perhaps making those unorganized counties consider organizing an Auxiliary This should be consider organizing an Auxiliary a yearly procedure

Advisory Council recommends to the Council (in line with the recommendation brought out in the News Letter) that the Auxiliary Legislative Chairmen from the organized counties be invited to attend the Conference of Legislative Chairmen to be held in Albany, February 25, under supervision of Dr Hannon The women would attend this meeting without the privilege of voting or taking part in the discussion

The President, Mrs Madden, met with groups Ulster, Greene, Onfrom the following counties tario, Monroe, Westchester, Richmond, Rensselaer. Genesee, Niagara, and conferred with Mrs Sullivan, of Scotia, Revision Chairman, and with Mrs Kenneth G Jahrause, Convention Chairman, in Buffalo Committee on Workmen's Compensation.—Dr

Dattelbaum, Chairman, reported on the following

matters

Broome County Round Table Discussion Director acted as moderator in a round table discussion on Workmen's Compensation arranged by the Broome County Medical Society and held at the Binghamton City Hospital on January 14, 1947 The meeting was participated in by representatives of insurance carriers, labor, and the Workmen's Compensation Board, as well as by the Chairman of the Broome County Medical Society Workmen's Compensation Committee. A large attendance participated in the round table discussion which embraced almost every aspect of workmen's compensation administration. We hope to have similar meetings throughout the State

The Director conferred with Mr Legislation Henry D Sayer, general manager of the Compensa-tion Insurance Rating Board, on proposed legisla-tion affecting the Workmen's Compensation Law

A number of bills have been introduced affecting workmen's compensation Your Committee has given careful consideration to these and sent opinions concerning same to Dr Hannon for the guid-ance of the legislative committee It also has given careful consideration to the legislation proposed by the chairman of the Workmen's Compensation Board and has expressed its view on the proposed legislation to Miss Donlon An amendment to the Workmen's Compensation Law carrying out the mandate of the House of Delegates to abolish the Medical Practice Committee and restore the functions carried out by them in the four counties to the county medical societies has been submitted

In accordance with the suggestion made by Dr Hannon at the last meeting of the Council which disapproved of the suggested amendment to Section 1250 of the Education Law to include the four specialties, your Director drew up an amendment to Section 1268 of the Education Law

No action was taken on this by the Council, but

it was discussed at great length

Joint Committee of the Hospital Association and edical Society Your Director attended a number Medical Society of meetings with the Counsel for the State Hospital Association and with Mr Eugene A. Sherpick, Counsel for the Joint Council of Radiologists, Anesthesiologists, Pathologists, and Physical Therapy physicians, and with Mr Clearwater, representing the State Medical Society in relation to the four specialties and proposed amendments to the Education and Workmen's Compensation Laws affecting

On January 31 a meeting was held with a committee representing the State Hospital Association and Dr Carlton E Wertz's committee of the State Society Council This meeting was devoted to a detailed discussion of the relationships existing between the hospitals and the medical profession with tween the hospitals and the medical profession, with particular reference to the four specialties Reference was made to the failure of the State Hospital

One-injection control of diabetes

THE LIFE OF MANY DIABETICS complicated by the need for two and sometimes three daily injections of insulin can be simplified by a change to Wellcome Globin Insulin with Zinc—which because of its intermediate action may provide adequate control with only one injection a day This welcomed change-over can be made in three clear-cut steps

- I. THE INITIAL CHANGE-OVER DOSAGE: On the first day 30 minutes or more before breakfast give a single dose of Wellcome Globin Insulin with Zinc, equal to 2/3 of the total previous daily dose of regular insulin
- 2. ADJUSTMENT TO 24 HOUR CONTROL Gradually adjust the Globin Insulin dosage to provide 24 hour control as evidenced by a fasting blood sugar level of less than 150 mgm or sugar free urine in the fasting sample.
- 3 ADJUSTMENT OF DIET: Simultaneously adjust

carbohydrate distribution of diet to balance insulin activity initially 2/10 4/10 and 4/10 Any midafternoon hypoglycemia may usually be offset by giving 10 to 20 grams of carbohy drate between 3 and 4 p m Base final carbohy drate adjustment on fractional urinalyses.

Most mild and many moderately severe cases may be controlled by one daily injection of Well come Globin Insulin with Zino a clear solution comparable to regular insulin in its freedom from allergenic properties Vials of 10 cc. 40 and 80 units per cc. Developed in The Well come Research Laboratories Tuckahoe, New York. U.S Pat. 2,161 198 Literature on request.

Association to approve the action taken by the Joint Committee and the Hospital Association and the Medical Society last year, which included the recognition of the four specialties as the practice of medi-After an extended discussion, a statement was drawn up giving the points of agreement reached This was referred to council representing the groups, for the drawing up of proposed legislation to amend both the Education and Workmen's Compensation Laws It is hoped that an agreement may be reached so as to enable the proposed legislation to be presented to the Council of the State Society for approval and introduced at this session of the legisla-A more detailed report of the meeting toture gether with the statement will be presented later

Radiology An examination for applicants for radiology rating was held at the New York University Medical College x-ray department on January 21 Of six candidates, two only made a passing

mark

Fee Schedule Increase On January 23, your Chairman and Director were invited to meet the advisory committee on the proposed fee schedule appointed by Miss Donlon, of which Dr Nathan B Van Etten is Chairman Your Chairman and Director presented arguments in support of the proposed fee schedule and made a strong plea for action before the meeting of the House of Delegates in May The committee recessed after setting a date for February 27, at 2.30 PM for the employers and insurance carriers to present whatever material they may have gathered in rebuttal of the fees proposed in relation to the over-all costs that would accrue in the event that the schedule were promulgated as proposed Your Director and Chairman were invited to be present at this meeting

Lists of Physicians and Specialists Your Director has undertaken to assist the county medical societies in maintaining complete lists of physicians and specialists, and to keep these lists in accurate form and up-to-date A bulletin has been issued to each county society emphasizing the importance of fully measuring up to our responsibilities in the qualification of physicians as general practitioners and specialists under the Workmen's Compensation Compensation Committees have been urged to apply the standards set up for the qualification of specialists to the end that only thoroughly qualified men may be given specialty ratings As a result of the bulletin, we have had prompt response from many county societies asking help in bringing their A number of county societies reports up-to-date have already taken steps to improve the work of their compensation committees in respect to the methods of granting specialists ratings under the Workmen's Compensation Law

Self-insured Employer Your Director brought to the attention of Miss Mary Donlon, Chairman of the Workmen's Compensation Board, a letter written by a self-insured employer, refusing authorization for an operative procedure which in his opin-ion violated the spirit of the Workmen's Compensa-

tion Law, for such action as she deems proper
Annual Meeting Conference It is suggested that opportunity be given for a luncheon and conference on workmen's compensation matters at the annual meeting to which the Chairman of the Workman's Compensation Committees throughout the State (or a representative of the committee) shall be invited on Wednesday, May 7, 1947 Such conferences in the past have been very successful and enable your committee and director to meet personally the representatives of the local compensation committees and discuss with them the many problems ansing under the Workmen's Compensation Law

Domestic Servants Through an error, the City of Rome was included (in the January 1 issue of the NEW YORK STATE JOURNAL OF MEDICINE) in the list of cities in the State of New York, having a population of 40,000 or more according to the 1940 census, in which cities domestic workers working forty-eight hours a week or more are required to be covered under the Workmen's Compensation Law A correction will be made in an early issue of the The city of Rome is not listed as being JOURNAL

of 40,000 in population or over Compensation Forms We have received numerous complaints from county societies throughout the State of their inability to obtain an adequate number of compensation report forms for distribution to physicians This matter has been brought to the at-tention of Miss Donlon, who replied that she was printing three million report forms a year and thought this number should be sufficient to cover the needs for the year She suggested that we confer with Mr Henry D Sayer, of the Compensation In surance Rating Board, as to a solution of this problem, since she felt that with the present shortage of paper it would be impossible to obtain a larger sup-Your Director and Mr Sayer conferred, and ply came to the conclusion that the number of report forms printed was totally inadequate Miss Donlon has published in the Press a statement to the effect that over 700,000 injuries were reported in the year It was drawn to Miss Donlon's attention that each injury is treated by a physician who is required to make out at least two reports entailing at least six copies of forms, and in protracted cases at least eight of ten forms are necessary This would indicate that the three million forms printed is less than 50 per cent of the amount required to enable physicians promptly to report their cases. It was drawn to Miss Donlon's attention that both Mr. Sayer, representing the insurance companies, and your Director felt that the Department should take the necessary steps to increase the number of forms available as indicated by the number of accidents reported We have received no reply as yet from Miss Donlon

Fee for Registration The Chairman of the Workmen's Compensation Board reported to your Chairman that an upstate county society failed to qualify a doctor because he refused to pay a fee of \$500 which the county charged The Secretary of the which the county charged The Secretary of the Society, who made this statement to the Chairman of the Workmen's Compensation Board in answer to an inquiry as to the failure of the County Society to act, is away for an extended period and not available for a statement The Chairman of the Workmen's Compensation Committee of said society, however, states that he had no knowledge of the action of the Secretary in the particular case but that he was certain that the Committee had never failed to act in any cases sent to it for review of the He further stated that applicant's qualifications the fee of \$5 00 which the County Society charges is for services rendered to the applicant and to all physicians who treat compensation claimants in any and all compensation matters The matter is still being investigated further

This report was amplified by Dr Kaliski, drawing the attention of the Council to a memorandum by Mr Sherpick, Counsel for the Joint Council of Pathologists, Radiologists, Anesthesiologists, and Physi-

POSTGRADUATE MEDICAL EDUCATION

Programs arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this Section of the Journal. The members of the committee are Oliver W. H. Mitchell, M. D., Chairman (428 Greenwood Place, Syracuse), George Baehr, M. D., and Charles D. Post, M. D.

Nassau County Dr Stockton Kimball, assistant professor of medicine and dean of the University of Buffalo, School of Medicine, will speak on "Treatment of Disorders of the Liver," on March 18 On April 1, "Nephritis" will be discussed by Dr David P Earle, Jr, of Goldwater Memorial Hospital, Welfare Island, and assistant professor of medicine, New

York University, College of Medicine

"Diabetic Ketosis and Coma" will be the subject of instruction to be given by Dr Philipp J R. Schmahl, clinical professor of medicine, New York Medical College, Flower and Fifth Avenue Hospitals, on April 8 On April 15, Dr L Maxwell Locke, professor of therapeutics and associate in medicine, University of Buffelo, School of Medicine, will speak on "Present Day Treatment of Arthritis" "Problems of Practice in the First Year of Life," by Dr Gaylord W Graves, clinical professor of pediatrics, New York University, College of Medicine, will be given on April 22 On May 13, Dr Wilfred W Fuge, instructor in surgery, University of Buffelo, School of Medicine, will lecture on "The Acute Surgical Abdomen."

This series of postgraduate instruction will be given on Tuesday afternoons at 4 00 o'clock in the auditorium of the Nassau Hospital, Mineola Rockland County The Rockland County Medi-

Rockland County The Rockland County Medical Society's postgraduate instruction, which are given at the Summit Park Sanatorium, Pomona, on

Wednesday afternoons at 4 00 o'clock, are March 26, "Traumatic Surgery with Emphasis on the Treatment of Wounds and Shock," by Dr Henry H Ritter, professor of clinical surgery, New York Post-Graduate Medical School, Columbia University, April 23, "The Treatment of Burns and Hand Infections," by Dr David Goldblatt, associate clinical professor of surgery, New York Post-Graduate Medical School, Columbia University, May 28, "The Care of Head Injuries," by Dr Carl A Peterson, assistant attending surgeon, New York Post-Graduate Hospital and Reconstruction Hospital, and June 25, "Bursitis, Sprains, Strains," by Dr B Bernard Kaye, associate in clinical surgery, New York Post-Graduate Medical School, Columbia University

Schenectady County Maj Joe W Howland, chief of the Research Branch, Medical Division, United States Atomic Energy Commission, Rochester, will present a lecture entitled "Medical Aspects of the Atomic Bomb," on May 13 in the Biggs Memorial Library, Ellis Hospital, Schenectady

Tompkins County Dr Lloyd F Craver, assistant professor of clinical medicine, Cornell University, Medical College, will speak on "The Significance of Enlarged Lymph Nodes," on March 17 The lecture will be given in the Tompkins County Memorial Hospital, Ithaca, at 8 30 pm.

ABSTRACT OF MINUTES OF THE COUNCIL

[Continued from page 626]

cal Therapy Physicians, as an argument against hospitals practicing medicine through the services of these specialists. It was presented to the Superintendent of Insurance recently. This memorandum was incorporated in the verbatim minutes.

The report was accepted

New Business

It was voted that Dr Herbert H Bauckus, Chairman of the Committee on Liaison with Veterans Administration, be invited to attend meetings throughout the rest of the life of this Council

Albany Office Lease

It was voted that the lease for the Albany office, submitted by Dr Hannon and approved by Counsel, be referred to the Board of Trustees, with the request that it be signed

Appointment of Delegates to Annual Meeting of Medical Society of New Jersey, Connecticut, Pennsylvania, and Vermont

It was voted that the President be empowered to appoint such representatives, if and when invited.

Presidential Medal for Dr Hale

Dr Bauer stated that as it was customary at the Annual Meeting to present the retiring President with a medal, that he thought it would be gracious if the Council asked the Trustees to have a medal presented to Dr Hale posthumously

It was voted that this be done

Scientific Exhibit

Dr Bauer brought up the matter of an exhibit of the New York State League for Planned Parenthood at our Annual Meeting

It was voted that Dr Bauer be instructed to write to Dr Hiss, Chairman of Scientific Exhibits, that the Council disapproved the acceptance of

such an exhibit

for the doctor who wants more

than Amino Acids for his patients—

"Drug Products

Protein hydrolysate— 8 vitamins—minerals

Sometimes hypoproteinemic patients need a real metabolic boost—more than a plain protein hy drolysate can supply For such cases Aminoprod "Drug Products is the product of choice

Aminoprod is not only a rich source of amino acids, but is a potent dietary supplement as well, indicated in the numerous clinical conditions in which hypoproteinemia is a factor

Congress on Obstetrics and Gynecology Announces Program of Fall Meeting

THE program of the Third American Congress on Obstetrics and Gynecology to be held September 8 to 12, 1947, in St Louis will feature general sessions for all groups making up the Congress as well as smaller individual group meetings and round table discussions

The morning sessions will be panel-type presentations of the following subjects Tuesanesthesia and analgesia, 10 cancer, and Thursday, day, September 9

Wednesday, September 10 cancer, and Thursday, September 11 cesarean section The afternoon meetings of the medical section of the Congress will consider on Tuesday, psy chosomatic aspects of pregnancy, on Wednesday, pregnancy complicating cardiac disease, diabetes, and tuberculosis, and on Thursday, recent advances in endo-

crinology Round table discussions from four o'clock to five daily will consider such topics as etiology of abor-

tion, asphyxia, fibroids, prolonged labor, infertility, early ambulation, adolescence, treatment of abortion, genital relaxation, ovulation, the menopause, the cystic ovary, uterine bleeding, nutrition in preg nancy, geriatric gynecology, endometriosis, and erythroblastosis

Concurrent sessions and round tables for nurses. hospital administrators, and public health workers

are being arranged

The popular forceps and breech demonstrations that attracted so much attention at the Second Congress in 1942 will be increased in number so that

eighteen demonstrations per day will be held, six each at nine, one, and five o'clock daily

A large Scientific and Educational Exhibit is being set up under the direction of Dr J P Pratt, of Detroit, and a comprehensive motion picture program is being arranged by Dr John Parks, of Wash ington, DC The committees assisting these doc tors will review applications by prospective participants late this spring Anyone wishing to make application for space in the Scientific Exhibit or for time on the motion picture program may obtain the proper blanks from the office of the Congress at 24 West Ohio Street, Chicago 10, Illinois

Hermann M Biggs Memorial Lecture to Be Given April 3

THE 1947 Hermann M Biggs Memorial Lecture under the auspices of the Committee on Public Health Relations of the New York Academy of Medicine will be held this year on Thursday, April 3, at 8 30 P M

It will be given by Haven Emerson, MD, emeritus professor of public health practice, Columbia University

The subject of the lecture will be "The Hospital

Survey and Construction Act and a Nation-wide Health Program "

This lecture, open to the public, will be the concluding session of a three-day Institute on Public Health which will be one of the features of the Centennial Celebration of the Academy

Following Dr Emerson's lecture, Senator H Alexander Smith, of New Jersey, will give an address on "Government and Medicine"

New York State Will Be First to Use B C G in Fight on Tuberculosis

NEW YORK will be the first state to produce and use the new vaccine, BCG, in the fight against tuberculosis, Dr Robert_E Plunkett, assistant

health commissioner, said February 9

Dr Plunkett, who directs tuberculosis control for the State Health Department, said that Dr Konrad Birkhaug, formerly of Norway, an authority on B C G, has been engaged to set up the program for the development of the vaccine He is now working under the direction of Dr Gilbert Dalldorf in the Division of Laboratories and Research at Albany

The State Health Department's tuberculosis control program is aimed at stamping out the disease in

New York by 1965

Although New York State's 1946 tuberculosis

death rate was the lowest on record, a mass x-ray program to control the disease uncovered 736 more cases than were reported the previous year, the State Health Department said

Dr Plunkett said the increase did not indicate that tuberculosis was increasing, but rather that "many hidden and unrecognized cases are being found"

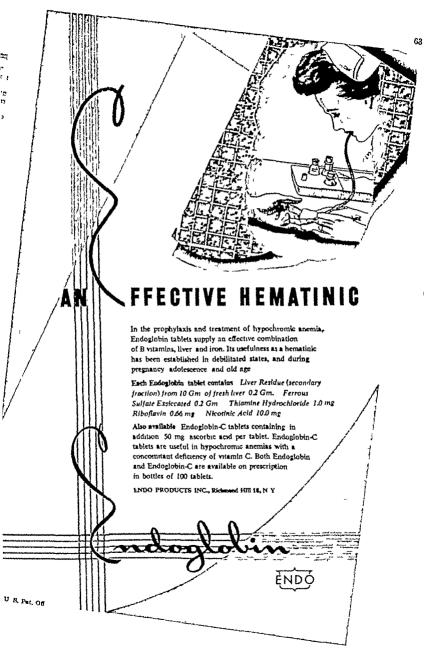

Half the 1946 increase in reported cases, he added, were in Buffalo, where the mass x-ray program was carried on "more extensively through use of a mobile unit" He said plans were being developed to assign equipment to local health departments "in order ultimately to provide free chest x-ray for every person in the State"

Tropical Disease Research Aided

THE American Foundation for Tropical Medicine, Incorporated, has completed negotiations with the Liberian Government for the establishment of an institute in the African Republic for research in tropical disease, Dr Thomas T Mackie, president of the foundation and an authority on tropical medicine, announced on February 14

Acceptance of the site and signing of the agreement was announced at the annual dinner meeting of the foundation in the University Club Dr

Mackie told the scientists and business executives present that the construction of the institute was made possible through a \$250,000 gift to the foundation, 270 Madison Avenue, from Harvey S Fire-It will be a memorial to his father An stone, Jr additional \$250,000 for the maintenance and operation of the institute, Dr Mackie said, will be sought largely from industrialists with an interest in tropi-The institute is to be open to graduate cal trade students

Personalities

Dr James G Parke, a native of Fairport, is now practicing medicine in Albion, having opened his office there January 1 *

Dr Bernard Vincent Scurti, having recently completed two years of service in the Navy, has located in Glen Cove He is associated with Dr L T Jackman

Dr Scurti is a graduate of the Long Island Medical School, Brooklyn Eye and Ear Hospital, and Kings County Hospital in the field of eye, ear, nose, At Kings County Hospital he was resident physician and surgeon

In the Naval service he was chief of an eye, ear,

nose, and throat department *

The resumption of the private practice of general medicine and surgery by Dr Daniel I Levine at Glen Knolls, Glen Cove Avenue, Glen Head, has been announced He was relieved of active duty as captain in the Medical Corps of the Army on November 17 *

Dr John R. Ross, who retired as senior director of the Hudson River State Hospital November 30, has opened an office in Poughkeepsie His practice will be limited to psychiatric consultation

Dr Lucius H. Bugbee, Jr, of Jamestown, has announced that he will be joined May1, by Dr Noble F Crandall, of Ashtabula, Ohio Dr Crandall, who has been practicing in Ashtabula for the past nine years will practice obstetrics and gynecology in association with Dr Bugbee *

Dr Harold Guzzo, of Margaretville, who opened an office last April 1, is now practicing in Washburn, Wisconsın

Dr Edward R Mountain has begun the practice of medicine in Olean in the treatment of diseases of the eye, ear, nose, and throat

Dr Mountain was graduated from the medical school of Yale University in 1937 He practiced medicine in Erie, Pennsylvania, during 1940 to 1944, prior to entering the Army Medical Corps. He served fifty-four months in the Army in the Pacific area and was honorably discharged from the service in June, 1946

He is a diplomate of the American Board of Oto-

laryngology

Dr Herman G Weiskotten, of Syracuse, has been elected chairman of the Council on Medical Education and Hospitals of the American Medical Associa-tion, succeeding Dr. Ray Lyman Wilbur The Council is concerned with the reconversion of medical education, the improvement of hospital internships and residencies, and the almost overwhelming task of meeting the educational desires of physician veterans

Dr Weiskotten has been dean of Syracuse Univer sity College of Medicine since 1925 where he is also professor of pathology During an early portion of the Community Health and Tuberculosis Demonstration, which was carried on in Syracuse from 1923 to 1930 with the advice and financial assistance of the Milbank Memorial Fund, Dr Weiskotten served as city health commissioner on a part-time He is a member of the State Public Health Council, of the executive committee of the S.C.A.A. State Committee on Tuberculosis and Public Health, and of the executive committee of the Onondaga Health Association

Dr Weiskotten directed and conducted a survey of the medical schools of the country ten years ago and reported the findings in an important volume, "Medical Education in the United States, 1934-1939 " He is also the author of "Medical Care of the Discharged Hospital Patient"

Dr L Whittington Gorham, of Albany, has been designated by Governor Dewey as chairman of the State Public Health Council, succeeding the late Dr Gorham is physician-in-Dr Simon Flexner chief of the Albany Hospital, a member of the execu-tive committee of the S C A.A. State Committee on Tuberculosis and Public Health, and of the Health Education Committee of the Albany Tuberculosis Association

County News

Cattaraugus County

Radiation therapy, indications, contraindications, was the subject of a lecture given by Dr Walter T Murphy to members of the Cattaraugus County Medical Society on February 13 at the Hotel Dudley, Salamanca, New York Dr Murphy is chief roentgenologist and radiologist at the Roswell Park Montaged Lighting Purificial Park Memorial Institute in Buffalo

Jefferson County

The regular monthly meeting of the County Society was held February 13 at the Hotel Woodruff in

* Asterisk indicates that item is from a local newspaper

Watertown with a dinner preceding the scientific program Dr Everett H Wesp, assistant in surgery at the University of Buffalo, School of Medicine, special to the control of Medicine, spoke to the group with a lecture entitled, "Surgical Measures for the Relief of Hypertension

Kings County

Two lectures were given at the stated meeting of the Medical Society of the County of Kings and the Academy of Medicine of Brooklyn on February 18

in the MacNaughton Auditorium. Dr Claude E Heaton, associate professor of obstetrics and gynecology, New York University, College of Medicine, spoke on the subject of "Gynecological Problems in the Adolescent Patient," and Dr Hilda Bruch, associate in psychiatry, College of Physicians and Surgeons, spoke on "Adolescent Problems in Obesity"

Dr Abraham Koplowitz on January 22 assumed his new duties as president for 1947 of the Kings County Medical Society, with a pledge to strive for a voluntary health insurance program and for legislation providing better food, housing, and clothing for the underprivileged

In his inaugural address Dr Koplowitz declared that this program is the "American way" of answering proponents of compulsory health insurance

mg proponents of compulsory health insurance
"Health insurance may alleviate the effects, but
not the cause of ill health," he asserted and added
"I have never seen in any compulsory health insurance bill any provision which would provide better
housing, food, and clothing for any proportion of our
population. It is the lack of these necessities which
is largely responsible for their illnesses. And it is
fallacious to think that health insurance is the answer
to their problem."

Dr Koplowitz admitted that the medical profession has "quite often been derelict in its duty to raise its voice in legislative matters which do effect the well-being of people and very often their health It is in such matters that the voice of organized

medicine must be loud and strong"

The Friday Afternoon Lectures to be presented by the Society during March and April are as follows March 21—"Carcinoma of the Colon," by Dr Burrill Crohn, consultant gastroenterologist, Mt Sinai Hospital, March 28—"The Two Types of Acute Coronary Disease," by Dr Arthur M Master, associate physician in cardiology and cardiologist, Mt Sinai Hospital, April 11—"Surgery of the Autonomic Nervous System," by Dr Reginald H Smithwick, instructor in surgery, Harvard Medical School, April 18—"Psychosomatic Aspects of Cardiovascular Disease," by Dr Edward Weiss, professor of clinical medicine, Temple University, April 25—"The Problem of Repeated Miscarriage" and "Hyaluronidase, a New Enzyme Essential for Human Fertility," by Dr Raphael Kurzrok, attending obstetrician and gynecologist, Morrisania City Hospital

Dutchess County

A testimonial dinner in honor of Dr John R Ross, who has recently retired as senior director of the Hudson River State Hospital, was given at the February meeting of the County Medical Society The speaker of the evening was Dr Nolan D C Lewis, Director of the New York Psychiatric Institute, Columbia, Presbyterian Medical Center, New York City, who gave a talk entitled, "Psychiatric Examination of the Nüremburg Criminals"

Madison County

The winter meeting of the Madison County Medical Society was held at the Hotel Oneida, Oneida, February 20 After dinner at 6.00 pm, the business meeting was held This was highlighted by a

talk by Dr Evelyn Rogers, district health officer, New York State Department of Health, who spoke on "The Organization and Work of a County Health Department" After this talk the meeting was given over to a discussion of a county health department and other health programs in Madison County

Monroe County

The medical veterans of Monroe County Medical Society were guests of the Society at a dinner held in their honor on February 1 at the Hotel Seneca, Rochester

At the regular meeting of the Rochester Academ of Medicine on February 4, Dr John Romano spoke to the members on the topic "The Diagnosis of Neurosis" Dr Romano, professor of psychiatry at the University of Rochester, School of Medicine and Dentistry, gave a clinic on psychosomatic medicine in the afternoon at the Strong Memorial Hospital The clinic was sponsored by the Council of Rochester Regional Hospitals and the Rochester Academy of Medicine

Onondaga County

"Medical Care of the Veteran" was the subject of a talk given by Dr Frederick E Lane, chief of the Outpatient Division of the Veterans Administration, when he spoke to the Onondaga County Medical Society on February 4 Miss Elizabeth Allen, of the Syracuse Chapter, American Red Cross, discussed "Other Problems of the Veteran"

The Syracuse Academy of Medicine held a meeting on February 18 at the University Club with Dr William P Berwald as the speaker Dr Berwald's subject was head injuries The discussion was opened by Drs Jerome E Alderman and Albert G Swift

Oneida County

The following are the newly elected officers of the County Society for the 1947 term president, Dr Fred T Owens, of Utica, secretary, Dr Oswald J McKendree, of Utica, treasurer, Dr Robert C Hall, of Utica, delegate to the State Society, Dr Oswald J McKendree, one year, and Dr A F Gaffney, of Clinton, two years, alternates, Dr F M Miller, Jr, of Utica, one year, and Dr T Douglas Kendrick and Dr John S Fitzgerald, both of Utica, two years

Dr Gerald F Jones was elected president of the Utica Academy of Medicine on January 16 at the annual meeting in the Utica Hotel About 70 attended

Other officers elected were vice-president, Dr Edwin P Russell, secretary, Dr H Miller Mitchell, treasurer, Dr H Verne Johnston, and council members, Dr Harold Pender, past-president, Dr Carl W Gruppe, and Dr H Dan Vickers, Little Falls.

Principal speaker was Dr William Durwald, Syracuse who speaker was Dr Pasquiale

Principal speaker was Dr William Durwald, Syracuse, who spoke on head injuries Dr Pasquale Ciaglia spoke on early diagnosis of cancer of the lungs, and Dr Evelyn Rogers, state district health officer, spoke on rabies as a public health problem *

HOSPITAL NEWS

Preliminary Report of Master Plan for Hospitals of New York City

A N AVERAGE of four general care hospital beds per 1,000 population are required for the care of New York City residents, according to a bulletin issued in February by the Hospital Council of Greater New York in New York City

In reporting some of the studies which have been made in the formulation of the Master Plan for the development of hospitals and related facilities in New York City, the Council suggests more efficient use of existing facilities rather than an increase in the number of general care hospital beds available

Despite the general impression that hospitals recently have been overcrowded, studies made by the Hospital Council reveal that "less general hospital care has been provided during the past five years than during the previous five years." In 1945, 8,759,630 general care patient days were reported. The greatest amount of general care service was provided in 1939 when 9,104,519 patient days were recorded

In making its studies of bed needs and other phases of the Master Plan which is to be presented this year, the Council divided the city into study areas, each with some of the features of a natural community Although living conditions and other economic factors were found to influence the need for hospitalization, the Council reports that the death rate of a community reflects the other factors involved

Studies show that approximately 120 patient days of general care have been provided in its hospitals for each death in New York City The Council con-

cludes that 041 bed per resident death should be available for the residents of the city

Pointing out a variation in the general care bed needs of the residents of each borough, the Council stated that 4 7 beds per thousand population are required by Manhattan, 35 by the Bronx, 39 by Brooklyn, 36 by Queens, and 44 by Richmond The Council states that "there is even more variation in the ratios for the study areas, which range from a low of 30 per 1,000 population to a high of Provision for the care of nonresidents also is made in Council estimates

Studies of the Council reveal that the proposed formula for calculating the number of general care beds needed does not require modification to include the birth rate of the community "In analyzing this problem," the Council reports, "it appears that the age distribution of the population is an important factor, since the need for hospital beds is primarily for persons in the second half of life." The Council found that the areas with high birth rates had a greater proportion of their population in the younger age groups than did the city as a whole or the areas with low birth rates

Other aspects of the Master Plan will be reviewed in future publications of the Hospital Council of Greater New York, a nonprofit organization, incorporated in 1938 to coordinate and improve the hospi tal and health services of New York City and to plan the development of these services in relation to com-

munity needs

Newsy Notes

A Cancer Prevention and Detection Clinic for doctors and nurses has been opened at Queens General Hospital It is held on the second Monday of each month from 6.00 to 9.00 PM Examinations are by appointment only
The Clinic is sponsored by the Queens County

Cancer Committee and is under the directorship of

Dr Leonard B Goldman

The Doctor's Hospital of Queens held a clinical conference on February 18 Dr Samuel Weiss, attending gastroenterologist, Polyclinic Hospital, New York City, and attending gastroenterologist, Jewish Memorial Hospital, New York City, spoke on "Newer Concepts of Hepatic Diseases," which was discussed by Dr Goodwin Distler, attending physician Mary Immagnifete Hospital and attending physician, Mary Immaculate Hospital, and attending physician, Queens General Hospital, in Queens

Plans to build a \$13,224,500 hospital and nurses' home in Elmhurst, Queens, in the triangular plot between Broadway and Baxter and Forty-first Avenues, were disclosed February 19 by Borough President James A Burke after an Associated Press dispatch from Washington reported a Federal Works Agency grant of \$342,000 to the City of New York

The money is to be used to finance the plans and specifications of the new hospital, which is to be known as the Elmhurst General Hospital and which is to serve the northern and western sections of the borough

Mr Burke said the plans, which he formed with Dr Edward M Bernecker, Commissioner of Hospitals, call for an 800-bed hospital to accommodate 2.700 persons *

WAS ITS "PROVING GROUND"

Infantile eczema, as well as infantile eczema with secondary pyogenic infection were the conditions in which the unusual therapeutic efficacy of Tarbonis and Sul Tarbonis was proved (Kenney E L Pembroke, R H Chatard, F E and Ziegler, J M, J A M A 117 1415 [Oct 25] 1941) Tarbonis presents a unique alcoholic extrict of coal tar—rich in the substances to which the action of tar is attributed—incorporated in a vanishing cream base containing lanolin and menthol Odorless, greaseless, and color less, Tarbonis provides all the efficacy of tar in its most valuable form. Indicated in many types of eczema (including the infantile), seborrheic dermatitis, eczematoid dermatitis, varicose and other indolent ulcers, and when ever the action of tar is required. When secondary infection supervenes, as in infected eczema or infectious eczematoid dermatitis, Sul Tarbonis is specifically indicated. It adds the antibacterial influence of sulfathuazole (5%) to the action of Tarbonis.

Physicians are invited to request literature and samples of Tarbonis and Sul Tarbonis

Dr Bacile is a veteran of World War II, having served for more than three years with the Medical Corps from which he was discharged as a lieutenant colonel

Other members of the new medical board are Drs James T Toomey, Max M Simon, A A. Leonidoff, Richard J Boyce, John J McGrath, John H Ding-man, and James E McCambridge Dr McGrath was chosen vice-president and Dr Boyce, secretary, of the board

At the same time, Dr McGrath became assistant chief of staff of the Hospital Dr Louis D Goldberg

was named recording secretary of the staff

More than 125 Buffalo and Lackawanna women have responded to the appeal of local hospitals forward helpers to relieve overburdened professional staff nurses of many non-nursing duties Three hospitals—General, Millard Fillmore, and Child-Three ren's—started training classes in January

Dr Homer Kesten, director of pathology at the White Plains Hospital, spoke on the "Rh Factor" at a quarterly meeting of the White Plains Women's Auxiliary, held in January at the Hospital's Nurses Residence *

The Mount Sinai Hospital of New York City presented a clinical conference on February 28 Dr A L Kornzweig spoke on "Fibrosarcoma of the Orbit Treated by Radiotherapy", Dr Arthur Glick, "Polyvalent Epidermal Sensitization", Dr Abner Kurtin, "Podophyllin Therapy of Plantar Warts", Dr W M Hitzig, "Two Cases of Constrictive Pericarditis Surgical Therapy", and Dr Samuel Rosen, "Two Cases of Otosclerosis Fenestration Operation Performed a Year Ago with Restitution of Hearing" Dr Samuel M Peck was the chair-The next clinical conference will be held on March 28

The acquisition of an entire East Side block as part of the site for the new Metropolitan Hospital

was announced on February 4

The new hospital will replace the present Metropolitan Hospital on Welfare Island A capacity of 750 beds is planned for the general part of the structure, with the upper floors devoted to a self-contained unit of 250 beds for tubercular patients

Dr John H Powers, of the surgical staff of the Mary Imogene Bassett Hsopital, Cooperstown, discussed recent developments in surgery of the heart and blood vessels at a meeting in January

The appointments to the medical staff of Huntington Hospital for 1947 recently announced by Miss Mary Jane Hutchinson, administrator, named Dr Morris R Keen as president with Dr Neil Falkenburg, vice-president and Dr Samuel Teich as secretary-treasurer Drs Falkenburg, Joseph Patiky, J L Sengstack, and M Keen were appointed to the joint conference committee and Dr Edwin J Grace was voted clinical director The emeritus staff includes Drs G H Carter, W Delaney, R. Dexter, and L P G Gouley

Dr Joseph G Patiky was again named chief of surgery Others appointed to primary positions in medical departments were Dr N E Falkenburg,

medicine, Dr David E Warden, obstetrics, and Dr W E Carpenter, pediatrics

Eye, ear, nose, and throat specialists include Drs T R Faulkner, Max Kimbrig, pathology, Dr Herbert Holleb, anesthesia, Dr C J Bernstein, roentgenology, Dr S T Herstone, roentgen therapy, Dr B L Fauerstein, allergy, Dr H A Ambramsen, psychiatry, Dr R E Beck, dermatology, Dr Francis Elson, and ophthalmology, Dr Arthur Gallo *

On January 21, a dinner was given in honor of Morris Rosenthal, of Gouverneur Hospital, DrNew York City, who has retired as active visiting otolaryngologist and has been appointed active consultant. Many of his close friends, among whom numbered representatives of various medical societies of New York City, were present to do honor to Dr Rosenthal, in addition to his colleagues and associates of the Medical Board and staff of Gouverneur Hospital

Dr Arthur A Hobbs, Jr, roentgenologist at the Barton Hepburn Hospital, Ogdensburg, since March of 1940, resigned recently to take up a similar position at the Deaconess Hospital, Evansville, Indiana '

Dr Rudolph Zander is the new resident physician

at General Hospital, Utica

He takes the place of Dr Vincent DeLalla, who left in November to pursue graduate work at Strong Memorial Hospital, Rochester

The new resident received his degree in medicine from the University of Berlin in 1932 and came to

this country in 1938

He came to General from the J N Adams Memorial Hospital in Perrysburg, where he was in charge of the pediatrics department *

Dr Thomas Aldrich, of Rensselaer, was named Gov Thomas E Dewey to succeed the late Dr by Gov Thomas E Dewey to succeed the late Dr Arthur W Benson, of Troy, as a member of the Board of Visitors of the New York State Reconstruction Home at Haverstraw

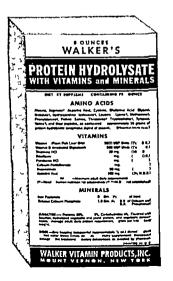

Dr Aldrich is a member of the attending staff of the Albany Hospital and has been engaged in the private practice of medicine in Rensselaer for more than a decade He was graduated from the Albany

Medical College *

Dr George M Mackenzie, director and physician in-chief of the Mary Imogene Bassett Hospital, Cooperstown, for the last twenty years, will retire from his post next September 1

The Hospital's board of trustees passed a resolution lauding Dr Mackenzie for his services to the institution, and expressed the hope that he would

NO TASTE BARRIER — For effective hyperalimentation, it is important to specify a protein hydrolysate product that does not present a taste barrier. The palatability of Walker's PROTEIN HYDROLYSATE with VITAMINS and MINERALS assures the physician of success in securing the patient's cooperation.

INDICATIONS Pre- and postoperative dietary therapy, peptic ulcer and certain other gastrointestinal diseases, nutrition al edema and anemia, pregnancy and lactation, febrile disease, periods of active growth and senescence, and wherever protein hydrolysate vitamin supplementation is indicated

Available through all prescription phar macles Professional literature on request.

DEPARTMENT OF WORKMEN'S **COMPENSATION**

CONDUCTED BY DAVID J KALISKI, M.D., DIRECTOR

Lump Sum Nonschedule Adjustments

THE Workmen's Compensation Board has issued a bulletin to all referees, examiners, and compensation clerks on the subject of lump sum nonschedule adjustments which may be of interest to the medical

profession

Referees have no authority to make lump sum nonschedule adjustments except when the claimant's condition, as shown in the record, is clearly only temporary When there is permanency, or an indication of same, the referee has no authority to make an award A lump sum nonschedule adjustment is in full payment of all claims for compensation, including both cash benefits and medical care. It shall not include unpaid medical bills for past treatment or unpaid cash benefits

Notwithstanding payment of a nonschedule adjustment, a case may be reopened for further con sideration on proof that the claimant's condition has changed for the worse or that there is a change in the degree of disability The latter must be subthe degree of disability The latter must be substantial and material Upon reopening and further award, the carrier is not entitled to be credited with any lump sum nonschedule adjustment approved on or after April 16, 1945

Total disability cannot be adjusted under any provision of law, neither can schedule disabilities or death benefits A nonschedule lump sum adjustat may not be made in lieu of surgery where sur-

is indicated

The following evidence must be developed on the record and findings made by the referee before a case can be considered under Section 15, 5-b, for award

of a lump sum nonschedule adjustment

Disability must be partial, either permanent or temporary In cases of permanent partial disability when a lump sum adjustment is agreed to by all parties, the matter must be referred to the Work-men's Compensation Board for its consideration and decision

In a case of temporary partial disability, when a lump sum adjustment is agreed to by all parties, the referee makes his decision on the proposed lump

sum adjustment

Referees must develop a full record both as to permanent and temporary disability, the degree of disability, the claimant's earning capacity, and his right to compensation The record must contain record of accident, notice and causal relationship.

and must also show that compensation for partial disability has been paid for not less than three months, which period need not be continuous provided it amounts in the aggregate to at least three months

The record must show that the continuance of disability and future earning capacity cannot be ascertained with reasonable certainty, and that the proposed nonschedule lump sum adjustment is in the interest of justice, is fair, and in the best interest

of the claimant

The referee must be certain that the claimant fully understands the proposed adjustment and agrees to it with knowledge of its terms and finality under the law and of the limitations of his right to reopen the claim Such cases must be referred to the After-care Service for investigation and report,

or to the Rehabilitation Bureau

The record must contain the report of a physical examination by an examining doctor of the Board in accordance with Section 19, made not more than thirty days before the proposed adjustment ports must clearly show the claimant's condition, complaints, the diagnosis, and that the physician knew the examination was made in connection with an application for a lump sum nonschedule adjustment It should state whether the claimant's condition is a permanent or temporary partial disability, and give the physician's prognosis as to the continuance of physical disability and future working capacity

If the case, or one of the causes of the claimant's disability, is a functional neurosis, a lump sum nonschedule adjustment should be approved only if there is in the record competent medical evidence that such adjustment will have a therapeutic value and assist in the claimant's rehabilitation, or that the attendance of the claimant at hearings would be detrimental to his recovery Such medical testimony must be by a qualified physician A proposal for a lump sum adjustment may not be entertained, except in cases of psy choneurosis, during any period when the claimant is undergoing treatment, or where the claimant underwent treatment within three months next preceding the proposal The above provisions are applicable to lump sum nonschedule adjustments applied for on and after April 16, 1945

UNITED STATES CIVIL SERVICE COMMISSION

The United States Civil Service Commission has announced an examination for Medical Officer (Speamounced an examination for Medical Officer (Specialist) which will be used to fill high-grade positions in various medical fields. These positions are located in Washington, D.C., and vicinity. Salaries for these positions range from \$7,102 to \$9,975 a year. To qualify, applicants must be graduates of a medical school with the degree of doctors of a medical school with the degree of doctors.

tor of medicine In addition they must have had progressively responsible experience or education in a specialized medical field For some positions, applicants must also be currently licensed to practice medicine and surgery in the United States or its Territories

The maximum age limit, 62 years, will be waived for persons entitled to veteran preference Further information regarding the requirements may be obtained from W. A. Charles Brammana be obtained from W A. McCoy, Chief, Examining and Personnel, Utilization Division, United States Civil Service Commission, Washington 25, D C

The fact that thousands of physicians are today using G E X Rays Model F Port able is perhaps the most convincing evidence of its recognized value

Within the practical range of service for which this unit is intended the quality of radiographs it is capable of producing is second to none regardless of price. You'll also appreciate the high standard of workmanship throughout.

The moderate investment required and the potential value of a Model F in your practice assuredly justify your investigation Mail this handy coupon today

MONEY ISN'T EVERYTHING-

(OR 15 17?)

BY GROUCHO MARX

What do you want to save up a lot of money for? You'll never need the stuff

Why, just think of

all the wonderful, wonderful things you can do without money Things like—well, things like—

On second thought, you'd better keep on saving, chum Otherwise you're licked

For instance, how are you ever going to build

that Little Dream House, without a trunk full of moolah? You think the carpenters are going to work free? Or the plumbers? Or the architects? Not those lads They've been around They're no dopes

And how are you going to send that kid of yours to college, without the folding stuff?

Maybe you think he can work his way through by playing the flute

If so, you're crazy (Only three students have ever worked their way through college by playing the flute And they had to stop eating for four years) And how are you going to do that world-traveling you've always wanted to do? Maybe you think you can stoke your way across, or scrub decks Well, that's no good I've tried it. It interferes with shipboard romances

So-all seriousness aside—you'd better keep on saving, pal

Obviously the best way is by continuing to buy U S Savings Bonds—through the Payroll Plan.

They're safe and sound Old Uncle Sam personally guarantees your investment And he never fobbed off a bum I O U on anybody

You get four bucks back for every three you put in And that ain't hay, alfalfa, or any other field-grown product

Millions of Americans—smart cookies all have found the Payroll Plan the easiest and best way to save

So stick with the Payroll Plan, son—and you can't lose

SAVE THE EASY WAY...BUY YOUR BONDS THROUGH PAYROLL SAVINGS

COLUMBUS INDIANA

If You Are Reading a Paper at the 1947 Annual Meeting

the New York State Journal of MEDICINE will appreciate your following the suggestions listed below in the prepa-These sugration of your manuscripts gestions have been devised in order to correspondence. avoid return papers for changes, minimize the work of preparation for the printer, and save the high costs of corrections made on galley proof

Size of Articles -It is earnestly desired that scientific articles shall not exceed 6 JOURNAL pages at the outside Longer articles tend to lower reader interest An average of five or six seems to be the most desirable from this point of view Calculation can readily be made by multiplying the number of double-spaced typewritten manuscript pages by the fraction two-fifths, eg, twelve manuscript pages will make five Journal pages

Manuscripts —Papers must be typewritten on one side only of white sheets consecutively numbered, and be double spaced with one-inch margins They should be prepared with one-inch margins. They should be prepared with great care so as to be typographically correct. All headings, titles, subtitles, and subheadings should be typed flush with the left-hand margin. This is imperative for rapid and accurate composition by the printers

Titles.—The title should be brief and typed in capital letters. The subtitle can be longer and should be typed in caps and lower case letters. Under the title, or subtitle, if there is one, should appear the name of the author and city in which he lives Directly under his name should be the hospital or institution with which he is affiliated

Subheadings.—Subheadings should be inserted by the author at appropriate intervals

References—It is the unfailing practice of the IEW YORK STATE JOURNAL OF MEDICINE to use specific "references" rather than "bibliography". There should appear in the text reference numbers, typed above and to the right of the word to which there is a reference. A list, consecutively numbered of these references should follow at numbered, of these references should follow at the end of the manuscript (Note that spelling in list is same as in text) The arrangement should be as follows and should include all items

Books—author's surname followed by initials, title of book, edition, location and name of publisher, year of publication, volume, and page number Thus, Osler, W Modern Medicine, 3rd ed, Philadelphia, Lea & Febiger, 1927, vol 5, p 57

Periodicals-author's surname followed by initials, name of periodical, volume, page, month (day if necessary), year of publication Thus, Leahy, Leon J New York State J Med 40 347 (March 1) 1940

The JOURNAL does not include titles of Note articles

Case Reports.-Instead of abstracts of hospital histories, authors should write these reports in a narrative style with properly completed sentences All unimportant details should be deleted with such general negative statements as fit the case

Tables —While tables are very useful on lantern slides in the reading of papers, they fail of this purpose to a large extent in the printed page For that reason it is urged that they be reduced as much as possible to descriptive language

Illustrations — These should be kept to the minimum necessary to make clear the points to be registered by the author. In some instances they are imperative to proper understanding, in others they are merely picturesque. The latter can be excluded to good effect, both as to space and the net meaning the sect.

and the not inconsiderable cost

When illustrations are to be used they should accompany manuscripts and each should always accompany manuscripts and each should always be referred to in the text, preferably by number Drawings or graphs should not be larger than 12 × 16 inches, and must be made with jet black India ink on white paper Do not use typewriter for lettering. The smallest lettering on 8 × 10 inch copy should be no less than 1/4 inch high. Cross-section paper (white with black lines) may be used, but should not have more than 4 lines per inch. If finer ruled paper is used, the major division lines should be drawn in with black ink, omitting the finer divisions. In the case of finely ruled paper, only In the case of finely ruled paper, only blue-lined paper can be accepted Lettering and all markings must be large enough to be readable after reduction Mail rolled or flat, never fold Photographs should be very distinct and show clear black and white contrasts They must be on glossy

white paper Avoid round and oval photographs Whenver possible "crop" photographs, i.e., mark portion that can be excluded when reproduced Crop marks should be on margin of photographs

Do not run pencil lines through photographs
It is important to mark the top of the illustration on the back, also its number as referred to in the text, thus, Fig 1, 2, and the name and address of the author

Legends should be typewritten on one sheet of paper and attached to the illustrations

Experience is the Best Teacher

Yes, and experience is the best teacher in smoking too!

THE wartime eigarette shortage was a real experience to smokers. Whether they intended to or not, people found themselves amoking many different brands, learning by actual experience the differences in cigarette quality

The result of all these comparisons was the biggest demand for Camels in history And today more people are smoking Camels than ever before. But no matter how great the demand

We don't tamper with Camel quality Only choice tobaccos properly aged and blended in the time-honored Camel way are used in Camels.

According to a recent Nationwide survey:

More Doctors Smoke **Camels**

than any other cigarette

Where does the foot end?

Anatomically at the 26th bone, but as physicians know the pinch of ill-fitted shoes is not actually felt at the toes or foot as layman think It is really registered at the nerve endings in the head

So perhaps the head is the best measure of a proper shoe, not through the eyes alone for modish lines, but through knowing that the first and last criterion of satisfactory footwear is a properly designed and fitted shoe

For your patients who really wish to be helpedfew shoes, if any, are comparable to Pediformes

ANNUAL MEETING

Buffalo Memorial Auditorium and Convention Hall May 5-May 9, 1947

THE House of Delegates meets May 5, 6, and 7 Scientific exhibits will be open Tuesday through Friday Postgraduate lectures will be held all day Tuesday Wednesday through Friday, Section Meetings and General Sessions will be held Hotel reservations should be made at once (See Page 710 this issue for list of hotels)

stable tyrothricin

in ointment form!

TYRODERM Tyrothricin Cream is particularly designed for treatment of a variety of skin infections. Developed by the Medical Research Division of Sharp & Dohme it contains 0.5 mg (500 micrograms) of stable tyrothricin per gram in a special emollient base. The tyrothricin present in TYRODERM Tyrothricin Cream is stable exhibits approximately the same range of bacterial specificity as penicitiin

remains in contact with site of application for a prolonged period of time acts promptly • 'TYRODERM Tyrothridin Cream is indicated in the treatment of pyodermatotes such as acree vulgaris, impetigo dermatitis vegetans, infectious eczematoid dermatitis and other dermatoses caused by gram-positive organisms. It is also useful in the treatment of varicose, decubital and ischemic ulcers, selected accessible postsurgical wounds and minor second and third degree burns. Sharp & Dohme, Philadelphia 1 Pa.

TYROTHRICIN CREAM

Supplied in 1-oz. tubes and 1 lb fars.

Accumulating evidence indicates that "Enziflur"—calcium flupride with vitamins C and D—may provide a valuable aid in the prevention of dental caries

"Enziflur" Lozenges should be allowed to dissolve slowly in the mouth thus bring lng the surfaces of the teeth in contact with the fluorine bearing saliva. One "Enziflur" Lozenge daily supplies the optimal dosage of calcium fluoride in combination with the minimum daily requirements of vitamins C and D.

Descriptive literature providing indications dosages and contraindications available to physicians and dentists upon request

Enziflur' Lozenges (No 805) are available in bottles of 30 and 100

"ENZIFLUR" Lozenges

AS AN AID IN THE PREVENTION OF DENTAL CARIES.

ERTRON IS THE REGISTERED TRADEMARK OF NUTRITION RESEARCH LABORATORIES.

In the office...

steroid therapy in arthritis

For more than twelve years Ertron—Steroid Complex, Whittier—has been employed in the treatment of arthritis in leading university and hospital clinics and in private practice

During this period of wide use numerous clinical reports covering observations on more than twelve hundred arthritic patients have repeatedly stressed these facts

- 1 Erron therapy brings about such subjective responses as increased resistance to fatigue improved appetite and reduction of pain
- 2 Erron therapy brings about such *objective* responses as reduced swelling in creased range of motion and improved muscle strength (as measured on the grip dynamometer),
- 3 Ertron is safe, for when proper controls and tests have been instituted no instance of severe toxic reaction has been reported with Ertron therapy in arthritis

Ertron has been clinically proved and found therapeutically effective

Ertron is chemically unique. Laboratory studies over a five year period prove that Ertron—Steroid Complex, Whittier—contains a number of hitherto unrecognized components which are members of the steroid group The isolation and identification of these substances in pure form establish the unique steroid complex character istics of Ertron

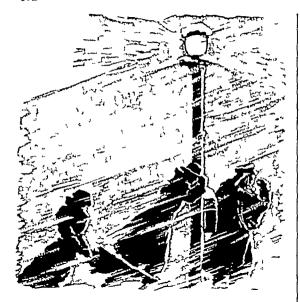

Physician control of the arthritic patient is essential for optimum results. Ertron is

available to the patient only upon the prescription of a physician.

Each capsule contains 5 milligrams of activation products having antirachitic activity of fifty thousand U S P Units Biologically standardized.

Ertron is supplied in bottles of 50 100 and 500 capsules

Also for supplementary intramuscular injection, Ertron Parenteral in packages of six 1 cc. ampules,

THE season of throat affections is here

Thantis Lozenges have proved especially effective in soothing and relieving these conditions. The effectiveness of Thantis Lozenges is due to two active ingredients.

Merodicein* an antiseptic which prevents the development of bacteria even in great dilution

Saligenin† a mild local anesthetic which relieves the discomfort of throat infections

Thantis Lozenges are antiseptic and anesthetic for the mucous membranes of the throat and mouth Complete literature on request

Supplied in vials of twelve lozenges each

 Merodicein is the H W & D trade name for monohydroxy mercuridiiodoresorcinsulfonphthalein-sodium

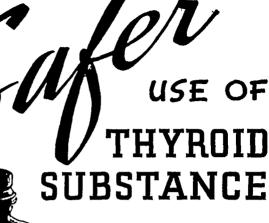

† Saligenin is orthohydroxybenzy lalcohol H W & D

Serious disturbances may result from moderate doses of thyroid unless an adequate intake of the B Vitamins is assured (1 2 3 4, 5) A relative hypovitaminosis is produced, with loss of appetite and the occurrence of katabolic, destructive changes in the animal organism

PANTABEEROID Tablets contain thyroid with liberal amounts of all the B ritamins, so that the supply of the latter is rendered adequate even with minimal thyroid dosage

IT IS TO BE BORNE IN MIND THAT THE PRESENCE OF THE B VITAMINS DOES NOT ELIMINATE THE NECESSITY FOR CARE FUL ADJUSTMENT OF THYROID DOSAGE

is vitamin-fortified

DEVELOPED by E. V McCollum Formulae Infant Food is fortified with all the vitamins known to be necessary for adequate infant nutrition. The McCollum procedure of incorporating the vitamins into the milk itself reduces the risk of human error or oversight in supplementary administration.

FORMULAG is a concentrated milk in liquid form. It contains sufficient vitamins of the B complex, Vitamin C in stabilized form Vitamin D (800 U.S.P units) copper manganese and easily assimilated ferric lactate—rendering it an adequate formula basis both for normal and difficult feeding cases. No carbohydrate has been added to FORMULAG. It contains only the natural lactose found in cows milk.

FORMULAG is promoted ethically to the medical profession alone. It has been tested clinically and proved satisfactory in promoting normal development and growth. Priced within range even of low-income budgets. FORMULAG is available in drug and grocery stores from coast to coast.

DISTRIBUTED BY KRAFT FOODS COMPANY

In treating Para-nasal Infection

achieve

Decongestion without rebound

The rebound congestion that follows the use of many vasoconstrictors creates a vicious circle that prevents normal function of the nasal passages

ARGYROL provides decongestion and bacteriostasis in addition to its cleansing and demulcent properties and hastens the return of normal function

The Three-Fold Action of ARGYROL

- ARGYROL is decongestive without irritation to the membrane, and without ciliary injury
- 2 ARGYROL is powerfully bacteriostatic, yet is non-toxic to tissue
- ARGYROL stimulates secretion and cleanses, thereby enhancing Nature's own first line of defense

Three-Fold Approach to Para-nasal Therapy

- 1. The nasal meatus by 20 per cent ARGYROL instillations through the nasolacrimal duct.
- 2. The nasal passages with 10 per cent ARGYROL solution in drops
- 3. The nasal cavities with 10 per centARGYROLbynasaltamponage

A New Name in Fine Pharmaceuticals and Endocrine Specialtie

Top Tunesmith...dietary dub!

He regards mealtime as an annoying break in the cadence of his workday So, like many others "too busy" to eat properly, he frequently orders a skimpy meal that can be speedily prepared and eaten—or he ignores the occasion entirely. The usual result is what any nutritionally conscious physician would expect another victim of subclinical vitamin deficiency. Nor is he alone Others who face the same danger are food faddists, people on self imposed and badly balanced reducing diets, alcoholics and excessive smokers. to name a few Since the bodily reserves of the vitamin B complex group are not large, even with good diets, one of the commoner results caused by improper eating is the deficiency of the B factors Corrective diet is indicated here, of course, and many physicians fortify this with a dependable vitamin B preparation. Sur bex is a pleasant tasting, high potency vitamin B complex tablet containing therapeutic amounts of five B complex factors with added liver concentrate and dried brewer's yeast Sur bey tablets have a bright, orange colored double coating which masks all traces of unpleasant odor Sur bex is now available for your use through prescription pharmacies everywhere Supplied in bottles of 100, 500 and 1000 tablets Abbott Laboratories, North Chicago, Illinois

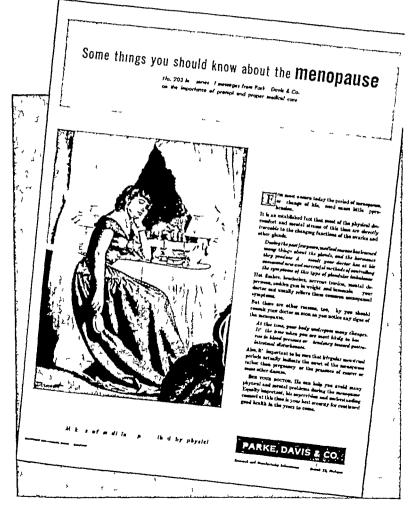

EACH TABLET CONTAINS

Thiamine Hydrochloride, 6 mg, Riboflavin, 6 mg, Nicotinamide, 30 mg, Pyridoxine Hydrochloride, 1 mg, Pantothenic Acid (as calcium pantothenate), 10 mg, Liver Concentrate,* 5 grs, Brewer's Yeast, Dried,* 2½ grs *For other B complex factors.

Addressed to your women patients

In its current "See Your Doctor" advertisement Parke, Davis & Company emphasizes the importance of seeking medical counsel at the time of menopause. This educational campaign, in behalf of the medical profession, appears regularly in color in LIFE and other leading magazines.

In a recent clinical study, Hawirko and Sprague* found that Dexedrine (d amphetamine) exerts two beneficial actions in the treatment of overweight

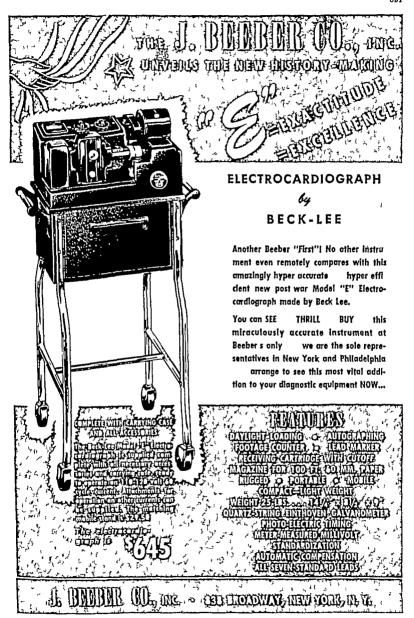

- 1 It depresses the appetite "sufficiently to enable the patient to follow the diet closely without feeling it too great a burden"
- 2. Its unique central nervous stimulant effect combats the feeling of "discouragement and irritability which usually accompanies rigid adherence to prolonged use of a low calorie diet"

Accurate STANDARD Permanent RECORDINGS!

Cardictron The First Successful

Direct-Writing ELECTROCARDIOGRAPH

The unexcelled performance of the direct-recording Cardiotron—a product of the Electro-Physical Laboratories—reflects more than a decade of experience in manufacturing direct-recording electroencephalographs.

In the Cardiotron the technique of direct electro-recordings are developed to perfection. This instrument produces instantaneous, permanent readings. All photographic procedures are completely eliminated. Thus, the Cardiotron enables cardiographic investigation during surgery as well as in routine office or clinical practice, or even in the patient's home. The Cardiotron weighs only 31 pounds, is vibration-proof and is free of susceptibility to strong interfering electrical fields. You are invited to send for complete details.

ANNOUNCING

A SPECIAL SERIES OF LECTURES TUESDAY, MAY 6TH AT THE 'ANNUAL MEETING, BUFFALO AUDITORIUM

TEACHING DAY

Arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York

O W H Mitchell, M D, Chairman George Baehr, M D, New York Charles D Post, M D, Syracuse

PART I

OBSTETRICS AND GYNECOLOGY

9:30 A M

- The Practical Applications of Endocrines in Gynecology George P Heckel, M D, Rochester
- 2 Causes of Fetal Mortality John S Labate, M D, New York

PART II

PEDIATRICS

- Common Sense in Infant Feeding and the Use of Vitamins
 A. Clement Silverman, M D, Syracuse
- 2 Newer Knowledge in Experimental Poliomyelitis Claus W Jungeblut, M D, New York

PART III

MEDICINE

2:00 P.M

- Medical Aspects of the Atomic Bomb Joe W Howland, M D , Rochester
- 2 Fibrositis (Muscular Rheumatism) Including Dupuytren's Contracture A New Method of Treatment Charles LeRoy Steinberg, M.D., Rochester

PART IV

SURGERY

- Diverticulities of the Large Intestine Charles G Child, III, M D, New York
- 2 Recent Developments in the Care of Prostatic Disorders John E Heslin, M D, Albany

Each Lecture Will Be Approximately Thirty Minutes Followed By General Discussion

These lectures are presented by the Medical Society of the State of New York with the cooperation of the New York State Department of Health

The Annual Meeting, 1947

It is time now to plan to attend the Annual Meeting of the Medical Society of the State of New York to be held this year at Buffalo, New York, May 5 to 9

The meetings of the House of Delegates, the Section Meetings, and the scientific exhibits will be housed this year for the first time in the Buffalo Memorial Auditorium, a short distance from the Hotel Statler The Convention Committee reports that the number of scientific exhibits this year will be approximately double that of last year, but the space afforded by using the Memorial Auditorium will be ample to accommodate the exceptionally large atten dance which is anticipated

It is hoped that we shall have an early Spring, and for those members and their families who will attend, the trip to Niagara Falls and down the Gorge to old Fort Niagara will be an added lure Come one, come alli

As usual, we urge our readers to reserve their hotel accommodations early Many new features, impossible during the war years, have been added to the 1947 program to make this year's meeting the most successful, inspirmg, and educational ever held by the physicians of the Empire State. The banquet will be held on Wednesday night at the Ho-With so many doctors now out of the services, papers to be read at the Section Meetings should be of more than usual interest and diversity. And while at the time of this writing the names of the principal speakers have not been definitely announced, the Editors assure you that nobody will be disappointed

Many matters of serious consequence will come before the House of Delegates for consideration and decision The aftermath of World War II has yielded profound social. economic, and political changes to which the institutions of medicine must accommodate themselves if they are well and truly to serve the best interests of the people and the profession

the meetings and deliberations of the House of Delegates the organized profession of the State will attempt to deal with these changes by the democratic process of free and open debate. The compli cated structure of our modern civilization is enveloping the practice of medicine, the system of medical education and the research groups, the hospitals and clinics in a web of changing laws, attempts to break down standards of licensure and practice.

and to impose governmental control and direction upon the profession

Medicine must preserve its fluidity, it must be able to adapt itself functionally to the real, the demonstrable needs of a changing economy, a changing social structure, and to make its own constantly improved technology and practice readily available to the sick. It must be jealous of its own independence of thought and action but without arrogance, it must remain free from the clutching claws of a ruthless and stultifying bureaucracy, it must scrutinize closely all proposals for change to be sure that such are practical and not merely apparently so

These are some of the functions of the House of Delegates which are frequently lost sight of In addition, the House must

consider well the qualifications of those whom it elevates to positions of leadership in the medical profession of the State, the officers of the Society, the delegates to the A M A, those who must make the democratic representative system work

At the annual banquet, certificates will be given this year for the first time by the Society to all those practitioners in the State who have been in the practice of medicine for fifty or more years

All who can possibly do so are urged to attend this year. The Convention Committee has labored long and hard to make this the best meeting ever held in the State. The facilities of the Buffalo Memorial Auditorium will be used also for the first time. Come yourself and bring your colleagues.

BCG

Recently, magazines and digests having wide circulation have undertaken to inform the public on the various alleged shortcomings, negligences, and derelictions of the medical profession with respect to the advancement of the public health, compulsory sickness insurance, and what have you This is a proper function of the lay press If the profession is, in fact, dilatory, it should be spurred to action But what action, and how fast?

As an illustration, take the case of B C G Recently, articles have appeared which convey to the public the impression that this preparation of viable organisms has been neglected in the ceaseless fight against tuberculosis. Interest in this procedure has varied to a great extent during the many years that active immunization against tuberculosis has been studied. Those most familiar with the subject have differed in their opinions regarding the true value of B C G.

They know that it is a preventive measure which requires very careful supervision and control. To use B C G without a clear understanding of these requirements is to invite confusion, false hopes, and a real danger from faulty methods. The question of its use is now the subject of much careful planning in the State of New York between

representatives of the State Department of Health and the Council Committee on Public Health and Education of the Medical Society of the State of New York

Primarily, BCG must be properly prepared This the State Department of Health is now doing at Albany But this is only the first step, its use must be carefully safeguarded

Having progressed to the point where a reliable vaccine is ready for use, who shall receive it? Articles in the popular press infer great and needless loss of life from tuberculosis because the use of the vaccine is neglected. People are either positive or negative tuberculin reactors. Tuberculin positive reactors do not need it and should not receive it. Negative reactors may receive a degree of protection from its use. Careful records and follow-up are essential to scientific check and double check on the degree of protection afforded the recipient.

To organize the procedure for a populous state as large as New York is a great responsibility. To this end the Council Committee on Public Health and Education of the Medical Society of the State of New York and representatives of the State Department of Health have held meetings to formulate state-wide procedures.

At present, it seems to responsible medical

men the part of wisdom to confine the use of BCG to the protection of those most exposed to infection who are found to be negative tuberculin reactors

Concurrently, a program of postgraduate medical education in the form of clinics and conferences will be held in various portions of the State with those physicians who are to participate in the development of the controlled use of B C G in their localities. In this manner an orderly program with adequately recorded and scientifically con-

trolled data becomes available for the expansion of the carefully integrated procedures for the benefit of the people of the State

690

If this is neglect of a medical modality, as some of the popular press seem to infer, it is an intelligent neglect deliberately calculated to assure protection to those who need it, with a minimum of risk and a maximum of scientifically directed, purposeful action by responsible representatives of medicine and government in this State

Let Them Eat Sawdust!

To those thoughtful people who have observed the operation of government controls in the matter of meat and other food products, fuels, and housing, to go no further afield, we address this editorial

Would you care to see the institution of American medicine, by which we mean medical education, hospitals, and medical practice, in a similar state of confusion?

It seems to us that the serious national postwar impairment of nonmedical services and supply, partly at least as a result of mept government controls, affords a warning that cannot be ignored.

The confusion and inept nature of governmental attempts at control of anything seem to reflect confused and inept thinking on the part of the people who have far too long permitted the establishment and expansion of the alphabetic agencies and their now well-entrenched propaganda machines

Propaganda, promises, and proscription produce no meat, build no houses, shelter no people, feed no invalids, warm no hospitals, mine no coal

Will the people in their wisdom turn the control and direction of American medicine also over to the grasping alphabetic agencies of government? If they, the people, do this, if they subject the medical schools, the hospitals, the practice of medicine, the care of the sick to the cold, blundering, impersonal recklessness of government agencies in the manner that has been repeatedly proposed under the guise of "health insurance," they will do it in the face of such warning experience as the people of other countries have

had but have disregarded. They will do it as well in indifference to the experience of other countries which have undergone such controls. They will do it against the best advice of the American medical profession.

Propaganda, promises, and proscription are, you will agree, no substitute for per-This is to indict no political ad formance ministration or party but to state a fact Yet, political control of medical institutions once established must subject them to such substitutions since, demonstrably, this is the fact wherever it has been tried Is medicine motivated by selfish considerations in opposing political controls? Certainly modern medicine is built around scientific facts and principles It deals with the lives of human beings, their medical emergencies, situations in which performance, immediate, skilled, and intelligent-not promises, propa ganda, and/or proscription-is essential

No thoughtful person will deny that when sick people are in need of medical service they need it usually at once, not later when it suits some bureaucrat's convenience to authorize it under regulation 297031-A46. when sick poeple need food they need it now and in kind and quantity ordered by a doctor, not promises of it sometime after a cabinet conference, three public hearings, authorization by four unions, and delay by six unauthorized strikes, with subsequent determination by endless fact-finding authorities that there is none to be had people? What are they but an aggregation of statistics for bureaucrats to juggle-let them eat sawdust.

Compensation

Our son looked up from his morning paper 1

"What do you think of this, Father? Interns at the City Hospital are paid \$1,440 a year and the elevator operators \$1,800"

"\$1,440 a year? Why that's a lot of When I was an intern I never was monev No intern ever was paid a cent fought for the jobs Will I ever forget the Combined Board Hospital Examinations!"

And we were off into a happy fog of reminiscences Later in the day, when our head had cleared somewhat, it began to dawn on us that from our son's point of view we must have sounded like an old fogy quick to resent such a charge, phrases began drifting through our mind "Social justice" "Pay according to deserts" Vague generalities like that When you come to think of it, it does seem strange that an elevator man, about the most unskilled laborer we can think of, should command more money than a holder of the degrees of Bachelor of Arts and Doctor of Medicine Why is it? It is because trustees are shrewd men who know their way around They do not, as the French say, "wipe their noses upon broken bottles" They know that the doctor wants to work and the elevator man doesn't

This important grasp of elementary facts goes back to the nursery Scientists, inventors, explorers, many doctors are children Give them an Arctic Expedition, give them a laboratory, give them a University Hospital. give them the most lovely toys that they can imagine and how happy they will be grateful to the lavish parent that thought of and provided for their every want How can you mention such a thing? How vulgar!

Money is a vulgar subject Just as vulgar as shabbiness, parsimony, nonhospitality, loneliness, monotony, and boredom

nd the elevator man don't If the 1p+ try this one excite

time professor of dest universities in research and us paid \$8,500 imes, October 18

a year We don't know that that is the exact amount and we wouldn't tell if we did

On that sum he is supposed to maintain the social standards expected of a professor. including entertaining, to educate, clothe, feed, and amuse a fairly large family Yes. we know it doesn't cost as much to live in his town as it does in New York

For it he gives full time to teaching and the hospital That is, full day time the evenings he writes his book Because he is an acknowledged expert in the treatment of a certain disease, he is required to see private patients that he doesn't want to see The fees exacted from these patients by the university go into the funds of his department Pretty smart, what? The professor pays for himself, see?

Some years ago both he and his wife were simultaneously seized with illness, for which they were treated in the university hospital-his-and charged full fees

Why doesn't he ask for more money? Because he likes his job better than he likes the nonessentials And the trustees know it He says proudly that he could easily make \$50,000 a year in private practice heve it

We suppose that to himself makes up the difference by thinking of the classes of adoring students that will pass on his name to coming generations discovery he may some day make Of the book that he has written

We were once talking to a trustee of a famous university. He was weighing the ments of two bacteriologists who had applied for a position at the university hospital "A is the better man, according to his references, but he's married and has two children and wants \$5.000 B's aren't quite so good, but he's a bachelor and will come for \$3,500"

"For Heaven's sake, why don't you take A and give him money enough to live on and make him and his family all happy? That's what you'd do yourself"

He looked surprised and pained of course I would, myself But when you are a trustee, you're spending other people's money "

And running other people's lives, we

April 1, 1947] EDITORIAL 701

wanted to say, but didn't Oh, yes His friends say the professor we referred to above is turning just a little pink

And is it any wonder? The professor is

an intelligent man, and, consciously or not, he realizes that he is being exploited. Naturally, he would like to see the rest of his profession in the same boat.

Current Editorial Comment

Is There a Real Need for Sickness Benefits Legislation?—Is there a need—a real, honest, factual nonpolyncal need—for auckness insurance or sickness benefits legislation in New York State?

The question is of vital interest to manufacturers of the State who are sich of guesswork and propaganda on the subject. They

want to know the facts

Associated Industries of New York State, Inc, has engaged the services of the National Industrial Conference Board, the foremost statistical organization in the United States, to adduce the facts

Associated Industries of New York State has a membership of 1,500 organizations in all branches of industry, representing \$5,000,000,000 000 of invested capital and employing \$800,000 persons or two thirds of all factory workers in the State. That is a lot to think about. When such an organization is interested to know the facts there is probably good reason for that interest. Stated in Bulletin No. 20-DD under date of July 10. 1946, the reason appears

It is the big principle of regimentation and socialization in which we are primarily interested It is to definitely know the facts in connection with that big principle that we are engaging in We feel that if we have facts which this survey cannot be challenged with respect to the experience of other countries with similar laws, together with the short but bitter four year experi ence of the State of Rhode Island, it will defi nitely prove what we believe to be true-that the passage of such legislation would be a tragic disadvantage rather than a kindness to those whom it is intended to benefit. The questions upon which the decision rests in broad torms are as follows

- 1 (a) Is any compulsory health insurance system or sickness benefits law necessary in view of existing voluntary medical and hospital plans? (b) To what extent are such voluntary plans now used and by whom?
- 2 (a) Is any such system of compulsory health insurance truly American and democratic?

(b) Will the adoption of such a system (or a suckness benefits law) lead to the socialization of in dustry and the professions in the United States?

3 Will the adoption of any system of compulsory health insurance or sickness benefits lead to thee reation of a gigantic administrative bureaucracy and make sickness the football of politics?

- 4 Is there any rational basis for a requirement that industry should be compelled to contribute to any system of compulsory health insurance?
- 5 To what extent, if any, would the adoption of a system of health insurance or sickness benefits in New York State handicap New York om ployers in composition with other states?

6 (a) Will compulsory health insurance improve or impair existing medical and hospital services? (b) Will such a system improve or impair medical research and the development of new medical and surgical technics?

Dental Carles and Dietary Carbohydrates For more than fifty years, since the in vitro experiments of Miller in 1890, when he published The Micro-organisms of the Human Mouth, the theory has gained ground that carles are promoted by the disintegration of the inorganic constituents of the dental enamel by the acid products of carbohydrate fermentation. In time the importance of vitamins and minerals in the diet became better understood, including particularly vitamins A and D, calcium, phosphorus and, more recently, fluorine

A recent report by King¹ considers the effects of a daily supplement of sweets and chocolate biscuits on the deciduous teeth of infants living at two nursery institutions in England The tests were made on 68 children, 22 of whom were under observation only six months, with no controls The other 46 children were divided into three groups including sixteen controls observed for twenty-four months, seventeen children who received sweets and chocolate biscuits, observed for twenty four months, and thirteen children who received chocolate biscuits, under observation for eighteen

¹ King, J D Lancet, Lordon, pp 546-549 (May 4) 1945

months All of the 68 children were given a careful dental examination by dental surgeons immediately before the trials began and at intervals of six months

The tests consisted of giving sweet "fruit-drops," each weighing about 64 Gm, or a chocolate biscuit, each weighing about 86 Gm, (or both), "every evening after the last meal and after any cleaning of the teeth with toothbrushes or mouthwashes"

The preliminary dental examination of the 68 children showed dental caries in only two (one child had 2 carious teeth, the other child had 6 carious teeth), with a total of 8 carious teeth. Succeeding dental examinations at intervals of six months to two years showed no increase in caries activity "Indeed, at the end of the tests, previously active caries became 'arrested'"

The average daily diet in those nurseries. from the standpoint of calories, minerals, Compared and vitamins, was excellent with the requirements suggested by the United States National Research Council's Committee on Foods and Nutration (1941). the diet of those children was adequate or above the recommendation, in calories, protein, total calcium, phosphorus, vitamin A. vitamin D, and in thiamin The fluorine content of the drinking water was million The excellence of parts per the of the 68 children is tested by the fact that those who had lived in those institutions for more than three years had the best teeth to be found in Eng-This is shown by a comparison of the following percentages of dental caries institution children, 45 per cent, rural Lewis, 76 per cent, London South East, 19 to 27 per cent, and Sheffield, 18 to 22 7 per cent

The value of King's report is reduced almost to the vanishing point by reason of (1) the small number in the test-only 68 childien, (2) the period of observation was too short, 22 for only six months, ten for eighteen months, and only 25 children for twenty-four months, (3) the use of too small an amount of sweets and chocolate, or both-never exceeding half an ounce, and often varying from only 6 to 13 Gm daily, (4) the sweets and chocolates were given only once a day, not repeated or habitual use many times a day as is commonly practiced by many children, and (5) the institutions selected for the tests are exceptional for the high quality of diets served, and the children living in those institutions for more than three years have teeth twice as good as those found in the best rural areas of England, and about four times as good as those found in Sheffield and in London The 1,302 teeth in the 68 children selected for this test, showed a carries incidence (0.61) of less than 1 per cent

The question of the causes of dental caries can be solved only by observations and periodic dental examinations of thousands of people over a period of a decade Such an experiment is being undertaken by the New York State Department of Health to determine the effects of fluorine in drinking It will extend over water on human teeth a period of ten years, using Newburgh, New York (population 32,000) as the experimental area, and Kingston (29,000), 23 miles distant, as the control The report by King is well prepared, filling eight columns, with five tables It would be valuable if, instead of tens it included tens of thousands of test subjects, and if the report covered a period of five to ten years instead of six to twentyfour months Its length and profusion of data are in contrast to its lack of convincing evidence concerning the relation between dietary carbohydrate supplement and dental carres

The Incredible Dr Paul Brooks, in his column in *Health News*, has brought an extraordinary fact to our attention ¹

We have always looked on undertakers with admiration We regard our own profession as quite sufficiently grizly, but after all, some of our patients do get well, whereas the undertaker practices in unrelieved monotony Above all did we think of him as a good business man, and yet he has been fooled and on a very large scale, too, and by whom? The doctors

The undertakers figured that on the transports bringing home the wounded there would surely be some dead men who had died on the way home. The Army thought so, too. We would have thought so Even the toughest, hardest-boiled ambulance-riding intern is bound some day to turn up with a corpse.

They prepared for a thriving business with 300 embalming tables, 300 dressing tables, caskets, uniforms, desks, and a staff of 120. That was early in 1942. And they didn't get a body. As we reflect upon the facts, this seems almost impossible, but for the facts we pass the buck to Dr. Brooks You've got to admit it makes a darn good story. It shows what the medical profession can do when it gets its back up

LABORATORY AND CLINICAL CRITERIA OF RHEUMATIC CARDITIS IN CHILDREN

LEO M TARAN, M D Brooklyn, New York

A LITTLE over two decades have passed since it was shown that nearly all patients suffering an attack of rheumatic fever present transient electrocardiographic evidence of heart disease. It was pointed out then that it was impossible to say during the course of the acute stage of the disease whether heart disease was established even in the case of apparent affection of the cardiac valves. It was felt that heart muscle damage could become apparent only with passage of long periods of time sometimes years after the acute disease.

Since then much solid evidence has been added to show that few, if any individuals with rheu matic fever escape heart disease. It has been the common experience of students in this field that many patients, without obvious clinical or laboratory evidence of rheumatic active disease continue to show progressive cardiac damage. And it is widely appreciated that these patients harbor a subacute carditis, which is insidious and subclinical and occurs more frequently than the acute phase of the disease. The presence of rheumatic activity is thus always suspected of being associated with a smoldering inflammatory process in the heart muscle even in the absence of the more chasac rheumatic manifestations.

But despite the increase in knowledge of the natural history of rheumatic fever, no specific diagnostic tests have been forthcoming cent years many laboratory tests have been proposed for measuring rheumatic activity These established in the mind of the physician a confident method for determining when the pa tient is no longer active While it is widely known that none of these tests, singly or in combination, can act as an adequate screening method for rheumatic activity a great reliance is placed upon them even by those who have seen many exceptions to the rule And even the student of rheumatic disease has been inclined to consider these nonspecific tests as pertinent in evaluating the presence of active rheumatic disease

Our experience with large numbers of children with rheumatic carditis seems to throw some doubt upon the diagnostic value of the currently used laboratory aids, and demonstrates clearly that the clinical assessment of the patient and a

Presented before the 140th Annual Meeting of the Medical Society of the State of New York, Section on Pediatrics, May 2, 1946 careful analysis of his heart action are the more adequate diagnostic criteria of rheumatic carditis. It is thus the purpose of this paper to present observations on the value of the commonly used laboratory aids in the diagnosis of rheumatic activity and to describe a group of clinical criteria, which have been found more helpful in screening the smoldering type of rheumatic carditis.

Two hundred boys and girls, six to fourteen years of ago, were under observation at the St Francis Sanatorium for Cardiac Children from the beginning of a rheumatic episode of carditis to the end of the active process and for a minimum of six months following cessation of rheumatic activity. Children who showed signs or symptoms of heart failure were not included in this study. Any child who had an intercurrent infection or illness which might affect the clinical or laboratory course of the carditis was excluded from this study.

The treatment of this group of children consisted of complete bedrest, a balanced diet, and moderate amounts of synthetic vitamins. Medication was used only to control annoying symptoms

The laboratory and clinical measurements were made at frequent intervals during the entire period of observation. These consisted of the essential tests which are in current use in both private and institutional practice in following the course of rheumatic activity.

Laboratory Measurements

Leukocutosus -- One in every 10 of our cases showed no elevation of the white blood count at any time during the entire course of active rheumatic carditis Nine out of every 10 showed a leukocytosis during the first two weeks from the onset of the illness, and 7 out of every 10 continued to show such elevation at the end of the fourth week. No leukocytosis was observed in any of our cases after the seventh weak from the beginning of the active episode It is significant that, while all cases having a leukocytosis had obvious manifestations of clinical rheumatic activity, 9 out of every 10 cases continued to show clinical evidence of active rheumatic disease after the total white blood count had returned to normal.

B Fever —Fever, as a significant manifestation of rheumatic carditis, is not borne out by

5

our observations All of our cases showed a mild febrile course for a minimum of one week from the onset of activity The greatest majority of cases, however, remained afebrile after the twelfth week from the onset of the acute process, and the average febrile period for the entire group of children was six weeks one fifth of the cases (20 per cent) had a lowgrade fever after the fifth week, and the longest febrile period was twelve weeks. While it is true that all our cases during the febrile period showed obvious signs of rheumatic active disease, the greatest majority of our cases (90 per cent) continued to demonstrate rheumatic activity after the temperature was completely normal

C A-V Conduction—In our experience, a prolonged PR interval in a rheumatic patient, without other laboratory or clinical signs of rheumatic disease, cannot be regarded safely as a manifestation of rheumatic active disease, and the return of the conduction time to normal does not always mean cessation of activity

Thirty-five of our children (17½ per cent) did not show any prolongation of the A-V conduction time at any time during the entire course of the active rheumatic process. It is probable that some of these might have shown a prolongation of conduction time had electrocardiograms been taken at more frequent intervals. Ninety-nine per cent of the children who had a prolonged auriculoventricular conduction time at the onset of the carditis showed a normal conduction time later. However, 75 per cent of the cases showed clinical evidence of rheumatic active disease when the auriculoventricular conduction time had returned to normal.

D Pulse Rate —The elevation of the pulse rate was found to be out of proportion to the elevation of the temperature, both as regards the degree of elevation and the duration during which the pulse rate was found to be rapid. Thus, the children who had a temperature of 101 to 102 F (38 4 to 38 9 C) had an average pulse rate of 140. Similarly, other children whose temperature had become normal continued to have a pulse rate of 120 to 130.

The first three weeks after the onset of illness, the pulse rate was found to be higher than at any other time thereafter. None of the 200 cases showed a pulse rate of less than 100 before the end of the ninth week from the onset of the acute episode, and none had an elevated pulse rate twenty-seven weeks after the onset. The most marked decline in pulse rate was observed at the beginning of the tenth week following the onset.

It is noteworthy that four out of ten children whose pulse rates remained normal continued to show some evidence of active rheumatic disease

Sedimentation Rate—In our group of cases, the sedimentation rate was not as good a guide of rheumatic activity as is commonly re-All children showed marked elevation during the first eight weeks from the onset of the illness, the elevation being most marked during the first four weeks. At the end of eight weeks, 15 per cent of the cases had normal sedimentation rates but many of these continued to show evidence of active rheumatic disease After the twentieth week, an increasing number of children showed a normal sedimentation rate, and at the end of thirty-two weeks, the sedimentation rate became normal in all the cases, although 40 per cent of the group still showed some clinical evidence of mild rheumatic activity

F Weight Gain — Consistent gain in weight has been considered as indicative of the onset of the quiescent phase of rheumatic disease. Our findings do not seem to substantiate this observation

More than half of our group of children were of normal or above normal weight at the beginning of the rheumatic episode. All children showed some loss in weight during the first eight or nine weeks of the active episode. Four months after the beginning of the illness, all children in this group were gaining weight consistently, but the average per cent gain was less than would be expected for age, sex, and duration of period of observation.

At the end of seven and a half months from the onset, all children had reached a normal weight gain level, although at this time 40 per cent of the cases still showed mild rheumatic activity

G Hemoglobin—Secondary anemia is usually present during rheumatic activity, the degree of anemia being related to the severity and the duration of the manifestations of the disease. It is considered a characteristic finding during active rheumatic carditis

All our cases showed a moderately severe anemia at the onset of the acute episode. At the end of twenty-eight weeks, one in every five children still showed a low hemoglobin level, and it was only thirty-two weeks after the onset that the hemoglobin of all the children had returned to a level of 12¹/₂ Gm or more

It may be said, therefore, that in our group of cases none showed a normal hemoglobin at the beginning of the illness, and all the children showed a normal hemoglobin eight months after the onset of the illness. On the other hand, 40 per cent of the cases showed clinical evidence of rheumatic activity after the hemoglobin had returned to normal

H Vital Capacity—It is generally agreed that a diminishing vital capacity is one of the earliest signs of left ventricular failure—It has

been suggested that a low vital capacity in a rheumatic patient when all other factors which might influence the vital capacity are excluded is to be considered as a good index of rheumatic activity in the heart muscle

In our experience the vital capacity seems to be the most sensitive single index of the progress of rheumatic active disease All children showed a vital capacity of 40 per cent or more below three months of the rheumatic activity none of our children showed a rise in vital capacity After the first three months some cases showed a gradual rise in vital capacity, but none reached normal for age and body surface until sixteen weeks following the onset of rheumatic carditis At this time, one in every four children had a normal vital capacity The last case whose vital capacity reading returned to normal was eight and a half months after the onset of active rheu matic disease On the other hand even after this lapse of time from the onset one quarter of the cases still showed mild clinical evidence of rhoumatic activity

In summary, it may be stated that those laboratory measurements upon which consider able reliance is placed in evaluating the progress of active rheumatic disease did not seem to be adequate for a diagnosis of activity in our group of cases. At the end of nine months from the onset of rheumatic activity all children in our group showed normal laboratory data, and yet a large percentage continued to demonstrate, clinically, rheumatic carditis

What then are the clinical criteria of rheumatic activity? The clinical criteria were evolved from a careful and frequent observation of the patient, and from a detailed study of his heart action during the entire course of the active process and for many months after the onset of quiescence. Many of these criteria have been described frequently in the literature, some have

not been clearly demonstrated

Clinical Observations and Criteria

Appearance of Patient —Fatigability without evidence of cardiac insufficiency, is the symptom which can be adjudged best from careful observation of the patient, rather than from a provocative inquiry into symptoms of fatigue. The child who under normal circumstances, is anxious to participate in all childhood activities, during mild active rheumatic carditis devises ways and means of substituting less vigorous and, in some instances, completely circumscribed activities, provided he is given the chance to do so
